Hunting required acute knowledge of the animals hunted, their habits, preferences of habitat and so on. Over the centuries a class of 'trackers' or *pagis* developed. Their knowledge of the jungle they frequented was incomparable. Their knowledge of the animals they tracked was awesome. Their ability to track the animal down by reading footprints and other signs in the forest had to be seen to be believed. It is a matter of regret that with the disappearance of royal patronage, this knowledge and art has vanished for all times, without the current powers that be learning from it. This is equally true of the incomparable knowledge about hawks, falcons, eagles and cheetahs that the *baazdars* and cheetah trainers, particularly of Bhavnagar and Kolhapur states, had of the life-cycle and ailments of these birds and animals. Unfortunately, along with the stopping of falconry and coursing with cheetahs, this too has vanished, though this knowledge could have been the basis for many a scientific enquiry for the protection of these species.

**T**he baiting of carnivores for *shikar* was a standard practice in India up to the time hunting was banned. The practice continued in some places for showing carnivores to tourists. In 1956, Jawaharlal Nehru visited the Gir. He wanted to see lions. Extensive baiting was resorted to, and subsequently it became the normal practice to show lions to lesser tourists. This practice ultimately degenerated into ludicrous 'lion shows', where hundreds of human beings could see the king of beasts at a distance of a few yards. Mercifully, the practice was finally stopped, apparently as a result of Indira Gandhi's personal intervention.

Prior to 1947, the pressures of human, cattle, sheep and goat populations were far less than the explosion

witnessed from the 1960s onwards. It is not realised today that the needs of the people were, therefore, far less then in terms of requirements of fuel, grass and wood. In Gir alone, for example, apart from some 18,000 cattle which live in the forest, 50,000 or more enter during the summer and monsoon months. This was never the case during the Nawab's regime. Equally unheard of was the regular poisoning of lions by Maldharis who started inserting pesticides in cattle kills for want of an efficient system of compensation for their loss. Similar conditions are regularly reported from other protected areas as well where tigers become the target of ire.

**T**he deeds and misdeeds of Indian princes have been the subject of wonder, more often criticism and ridicule. Suffice it to say that their actions were part of the historical process. But it was the princely pursuits which left behind a substantial portion of the core of flora and fauna to be preserved by the inheritors of their powers and prerogatives.

It is the tragedy of our times that we continue with an insensitive administration headed by disinterested peoples' representatives. While in the short term, India is hailed as a great success story of a free people, the polity as a whole has failed to devise a successful system of protection for the little of our natural heritage that remains. Apart from galloping population growth, the increasing expectations of a better standard of living and an extensive use of insecticides, pesticides and the like to increase agricultural production, continue to devastate our natural resources. If we ever discover the genius to succeed against these odds to preserve what we have, it would be a fitting republican complement to the princely bequest.

# A problem with pachyderms

VIVEK MENON

ABIOLOGIST would blanch at clubbing an elephant with a rhino. The two are totally unrelated and their nearest ancestor might well have been a rabbit-sized African mammal which lived nearly 500 million years ago. In loose colloquial language, the two are referred to as pachyderms. The Latin term pachyderm is merely a physical description meaning tough skin. The rhino and the elephant are, however, joined together by the term—unscientific, illogical but convenient. In India the two giants are linked by much more than a name. Both are mega-herbivores, both require space and both are killed for parts of their bodies that are high valuable commodities in the wildlife trade markets of the Far East. In trying to conserve them, these similarities are therefore paramount.

The greater one horned rhino is one of five rhinoceros species found in the world, two in Africa and three

in Asia. The three Asian rhinos are all perilously endangered, globally there being only 3,000 of them. Internationally, the sad story of the decline of the African rhino is well known. Despite the sharp decrease in the African black and white rhinoceroses, they still number more than 10,000. Of the three Asian species, the Javan and Sumatran are very endangered, the former having a world population of 50-100 and the latter only 300.

In comparison, the 2,000 greater one horned rhinos that exist in India and Nepal seem to be a conservation success story. In India the rhinos appeared in the North West along the riverine plains of the Indus and Ganges rivers nearly 60 million years ago. The species, *Rhinoceros unicornis*, has remains unchanged for all these years despite being slowly pushed eastwards into small pockets of protected lands. The number of rhinos mean-

while diminished every successive year. Globally, the 30 genera of the rhinoceros family went down to only five. In India, the days of the rhinoceros slowly started coming to an end.

In 1030 AD, the traveller-historian Al Beruni wrote of the animal which existed 'in large numbers in India, more particularly about the Ganges.' Ibn Batuta, an Arab traveller, saw rhinoceroses near the Indus river in 1340 AD. Babur, the first Mughal emperor of India (1505-1530 AD), hunted rhinoceroses west of the Indus River, which he records as being called *kargkhana* or 'rhinoceroses-home', in such great numbers were the animals found there. He also records the existence of rhinoceroses near Peshawar (now in Pakistan) and, in fact, uses the word 'masses' to describe the quantity in which they were found. However, a few years later, in March 1529, Babur found no rhinoceroses near Benaras when he went there for a hunt. Sidi Ali, a Turkish admiral of Suleiman the Great, saw, in 1556, rhinoceroses in northern Pakistan near the city of Peshawar and records them as having a horn of two hands' length. Akbar, the third Mughal emperor of India (1542-1605), records the existence of rhinoceroses near Sambhal in Uttar Pradesh. Another Mughal emperor, Jahangir, records them in his memoirs as inhabiting Aligarh.

A large number of miniature paintings and other 'naturalistic' representations depicting rhinoceroses were made in India between 1500 and 1650 and are characterised by the famous miniature painting of circa 1600, showing Emperor Jahangir hunting rhinoceroses. Although these animals are easily recognisable as greater one horned rhinoceros, all three Asian rhinoceroses once inhabited the Indian subcontinent. The Javan and Sumatran rhinoceroses

*Rhinoceros sondaicus* and *Dicerohinus sumatrensis* became extinct in India in the early part of this century and the greater one horned rhinoceros is therefore now the only rhinoceros species left in the country. While the Javan rhinoceros was the first to be extirpated, perhaps as far back as 1900, the Sumatran rhinoceros is believed to have survived till 1935.

Both these rhinoceros species had an easterly distribution in India, the Javan rhinoceros being known from Bangladesh to Assam and Sikkim in the far north-east of India. The Sumatran rhinoceros is reported to have existed in Assam also, and areas bordering Burma. The greater one horned rhinoceros, in comparison, ranged from as far west as Pakistan, to the very north-eastern tip of India. Past evidence shows that the species existed from Pakistan to the Indian border with the countries of Myanmar, Nepal and Bhutan, and may have also existed in southern China, Myanmar itself, and even further east. The species disappeared from most of northern India during the 17th and 18th centuries, as a result of the combined pressures of habitat loss and hunting: few records exist of the greater one horned rhinoceroses in northern India from the 19th century.

The Asian elephant, *Elephas maximus*, was first noted in India in the Shivalik hills and seems to have come from Africa where it evolved nearly five million years ago. The rhino is therefore a far older animal in comparison. Although much like the rhino, the elephant came in from the north-west, it did not restrict itself to riverine plains and occupied large portions of peninsular India. The sweep of the elephant across India is roughly crescent shaped. It is missing from the high Himalayas as also from the coasts, and is not present in central

and western India. The rhino is an animal of swamps and marshes, grasslands and waterbodies. In comparison the elephant is at home in forests, grasslands and even land occupied by human beings. This adaptiveness by the relatively newer species has helped its survival to a greater extent than the rhino. Today, the range of the Asian elephant spreads over 400,000 sq km in 13 countries. There are 50,000 elephants in the continent and India has more than half of them.

A striking contrast between the two pachyderms is their family life. The rhino is by and large a loner. Males and females come together only for mating and otherwise lead a solitary life. Once the female is pregnant, neither her mate nor any other female rhino gives her any help. She has a long pregnancy of nearly two years and then brings up her single child for nearly two and a half years. After this, the child can look after itself and the mother is free to mate again. This means that the mother has invested nearly five years in bringing up one child, a heavy price to pay in evolutionary terms. The elephants on the other hand live in families. Although the males are also largely loners, the females live in families or herds consisting of a large number of adults and calves. Though the elephant normally gives birth to one calf, the survival rate of its offspring is better than that of the rhinos because of care by the herd.

The elephant and rhino are bound together not only by biology but also by threats to their very existence. The first conservation problem is that of space. India is the seventh largest country in the world. It has negated this natural gift by cramming itself with nearly one billion people. In the tiny cracks and crevices left, the rest of life struggles to exist. These

habitats are minute and fragmented, hemmed in by the thronging crowds. Into these rat-holes must fit the gargantuan bulk of the elephant and the rhino.

*Elephas maximus*, the Asian elephant is smaller than its African cousin, but adult males weigh a few tons. The Indian rhino is larger than all the other four species of rhino found in the world. Sizes of this sort require space, just to eat food and procreate. This is much more so in the case of elephants, who lead a locally migratory life. A fixed amount of space for them to take a morning walk is not enough. Elephants move seasonally between feeding grounds and in the process come into contact with human beings. The rhino on the other hand is found in protected area pockets, where a day-to-day conflict situation does not arise. This is, of course, not as much the credit of the rhino, but of man who has limited the spread of the animal.

**H**istorically the rhino extended from Pakistan, through the rich alluvial plains of the Ganga to the tip of north eastern India where it met with the Sumatran and Javan species. Today the same animal is confined to seven protected areas in Assam and West Bengal, venturing out occasionally only to be chased back by stone throwing people. It is slightly more difficult to chase an elephant. To start with, elephants often move in larger numbers than the rhinos. They are also intelligent enough to go where they want to go and find a method to do it. And so, the elephant comes into contact with man. Aggressive, bloody contact.

Assam today has 5,000 elephants of which 1,000 are captive. The *mela shikar* of Assam that resulted in the capture of 300-400 elephants every year from the wilds was banned

in 1978, and the 4,000-odd wild elephants of the state were left to roam free. It was only recently that the Assam government was forced to re-introduce the scheme of elephant capture after marauding elephants left a trail of destruction throughout the state as well as in eastern and southern India. In 1985 at least 85 people were killed in Assam, and in one small pocket of Holangapar alone, local elephants accounted for 12 lives in three years. In south Bihar about 20 persons were killed in 1992 and over Rs 1,20,000 paid as compensation to families of the victims. In 1992-93, 633 people were paid compensation just in the East Khasi district of Meghalaya and in the same year, 29 different cases of elephant depredation caused the loss of crops on 326 ha of land near Pakoi sanctuary in Arunachal Pradesh. Add to this the 30-50 people killed annually in South India as well as the case of one adult bull elephant plowing through 940 sq km of land rich with finger millet crop in Hosanur in Karnataka and the scale of devastation becomes clear.

**E**cological studies on the elephant make clear that catching elephants seasonally will not solve the problem of crop raiding or manslaughter. This would only cause fragmentation in elephant herds and make the creature more intolerant of man. Man has encroached on ancient elephant migratory paths by building the Chilla barrage across the Terai near Hardwar and stopping the northern pachyderms from coming into the plains. Although firecrackers, shooting, electric fences, trenches and loudspeakers have been, sporadically used to keep away the angry Ganesha, a permanent solution can only come through an understanding of elephant behaviour and a respect for their traditional migratory paths.

The problem with space is accentuated by the fact that we are rapidly losing our forests. What was an elephant jungle ten years ago is today a banana farm; what was a rhino swamp is today drained and settled down by immigrant Bangladeshis. Rhinos, with their relative lack of evolutionary initiative, are being increasingly confined into small safe deposit lockers. The elephants, which have more of a means to protest, do so by bulldozing through houses and killing human beings in fairly large numbers.

**A** second problem common to both the behemoths relates to poaching for the trade. Few tribes eat rhino meat and even fewer eat elephant. The hunting era of a century ago does not exist any more. So the animals are killed for trade – the elephant for its tusks and the rhino for its horns. The demand largely caters to a foreign people, both items ending up in the Far East. The patterns of this second pressure are also similar for both the elephant and the rhino. At the ground level, poachers are relatively low key and crudely armed. There are exceptions to this such as rhino poaching in Assam and the terror of Veerappan in Tamil Nadu and Karnataka. In these cases, poaching has taken a more organised and well-armed shape. Otherwise it continues to remain the preserve of local gangs financed and egged on by middlemen and traders.

At the level of trade, both are master-minded by well organised mafia and the word 'poaching' and illegal smuggling has been replaced by wildlife crime. Both the rhino horn and the elephant ivory have limited use in India – one for internal carving and the other for limited medicine systems. It is traditional oriental use, however, that puts a heavy price on both animals. Rhino horn is prized in traditional Chinese medicine, a kilo

selling for as much as US \$50,000. This is in its final shape in a Taiwanese or Chinese market. In India, the man who kills a rhino may get a few thousand rupees. Similarly, ivory finds its way into the Far East as carvings or as supply for the Japanese name seal industry. The Japanese cannot sign and require three seals to go through life. The richer one is, the better should be the material of the seal. For this there is nothing that transcends ivory. As gold is to the Indian, ivory is to the Japanese. This craze for the white gold spurs on the poaching of elephants.

**H**ow does poaching affect the rhino and the elephant? For one, the two react differently showing their biological dissimilarities. There are only 2000 one horned rhinos in the world; 500 in Nepal and 1500 in India. Both males and females have horns and both are equally big. Poachers therefore go for either male or female. This unbiased killing puts a direct pressure on this very small population. India at one stage was losing up to 60 rhinos a year to poaching, a huge figure considering the total number. Last year we lost over 100 elephants due to poaching, nearly double the rhino figure. At a cursory glance it may appear that this does not pose a problem. This is because there are 25 times as many elephants than rhinos; 50,000 in Asia, 30,000 in India. The problem is actually slightly more insidious. In Asia only males have tusks and only adult males have large enough tusks to interest a poacher. The number of adult tuskers in India is less than 2000, perhaps even as low as 1500. Much like the rhinos. The problem does exist after all.

Socially, the two animals are on two different planes. The elephant is a god, even if it is turning out to be a nuisance. In most parts of the country

Ganesh is still worshipped. In most places people still respect the elephant. Most people will not harm it knowingly. In comparison, the rhino has little religious significance. The people of Assam call it a state animal and preserve Kaziranga primarily because of the fame that it has given Assam. Still, the government does not consider it enough of a priority to give it money, or to even give salaries on time. The rhino's fate is largely linked to that of the state government. As most rhinos are found in government-managed protected areas, it is the will, or lack of it, of the elected representatives that will decide the fate of the rhino.

**T**he fate of the elephant on the other hand is linked to the people at large. Mere conservation measures by the government will not save the species. The elephant comes out of its designated areas, reminding man, sometimes brutally, of its existence. A god who is the largest land mammal in the world. So far, people are not against either of the animals. This is perhaps why both of them have survived for so many years. While they were being wiped out of neighbouring countries, they have clung on in India. But the country of their habitat has the largest number of human beings and therefore the largest potential for conflict. It is just that the human being in India is struggling to live; not pointedly against these animals but rendered apathetic by fate. Though the conservation wisdom of their ancestors still rings in Indian ears, the exhausting business of living prevents them from hearing it. It is thus left to that section of our countrymen who are fortunate enough to have their daily needs taken care of to look after these giants. It will take a while for the rest of the country to join them. It is important that these animals survive till then.

# Animal farm

INDRANEIL DAS

WHILE the conservation of biological diversity is considered desirable and in the public interest, biodiversity conservation by itself may be difficult to quantify economically, particularly in India where the common man struggles to stay alive. Inhabitants of zones surrounding protected wildernesses often dislike protected areas because they generally provide little income, restrict their cattle from grazing within the boundaries, and lead to crop damage and loss of human lives to wild animals.

In these zones the state has exclusive rights to vast tracts of forest and other land, and few or no rights of the human populations inhabiting the area are recognized. The Indian Forest Department came to own a fifth of the land area of the subcontinent as a result of its colonial background, making it one of the largest forestry enterprises in the world. Conflicts over forest use practices have led to virtually uncontrolled, mostly unsustainable exploitation of forest resources by the local land owners, including those traditionally dependent on forests, recent settlers and agencies with interests in timber, mineral and other extractive processes. Thus, although states have appropriated large areas displacing local communities, the policing of forests has generally been lax, with the result that alternative structures to allow sustainable use of forests are non-existent and ineffective.

New management systems need to define the tenurial rights as well as needs of local communities, and more active participation in land use planning by the people should be encour-

aged. Sustainable utilization of wildlife, sometimes through farming and ranching, has the potential to create a 'vested interest' within local communities to protect wildlife, which otherwise has no monetary value to people. Whenever possible and feasible, modern conservation procedures should be synthesized with traditional conservation principles. Community participation should be encouraged by promoting sustainable use to build a solid socio-economic basis for conservation.

One of the few truly sustainable projects involving herpetofauna is the snake venom project run by Irula tribals in Tamil Nadu, South India. Irulas are a tribe of approximately 100,000, inhabiting the South Indian states of Tamil Nadu, Andhra Pradesh and Karnataka. Irulas have caught snakes, mostly for the now illegal snake-skin trade, for generations. The ban on the trade (in 1978) deprived them of this primary source of income. The Irula Snake Catchers Industrial Cooperative Society, formed in 1979, started with 26 Irula members with an expertise in catching, without any protective device, the 'big four' poisonous snakes in the plains of south India: the spectacled cobra (*Naja naja*), common krait (*Bungarus caeruleus*), saw-scaled viper (*Echis carinatus*) and Russell's viper (*Daboia russelii*).

Snakes caught from the wild are brought to the society's premises, where they are measured, weighed and clipped with a code identification unique to the snake. The snake is then kept for a fortnight, during which it is

milking of its venom two to three times for the manufacture of anti-venom serum and other life-saving drugs. After the extraction, the snake is released back into the wild. Proceeds from the sale of the venom have helped improve the lifestyle of the Irulas. Currently, the society has a membership of 200 Irula men, women and children.

**C**onsumptive utilisation strikes a raw nerve among many colleagues, but given the fact that it works, it should at least be looked at impassionately. That chickens, pigs, cows, sheep and goats (leave alone rice, wheat, and virtually everything we eat) undoubtedly had wild ancestors shows the human genius. Achieving success in creating a closed system, with little or no dependence on the wild, is no mean feat, and it can be replicated. There is evidence to show that sustainable use of wild species – be it limited harvesting from the wild (ranching) or even a closed system of raising (farming) for meat, leather, horns, bones and so on, has the potential to improve the lifestyles of the local landowners, promote socio-economic growth in the region and even contribute to practical conservation activities through public participation in protecting what is envisaged as 'theirs', money for hiring of guards and purchase of guns, wireless and patrolling vehicles.

A large amount of data can be generated from studies of animals kept for sustainable utilisation projects, with little additional resources. This includes biological information, such as population size, recruitment, age to maturity, breeding period, mortality rates, population structure, sex ratio and relationships with sympatric species.

Opponents of sustainable utilisation claim that the system would lead to uncontrolled poaching of wild crocodilians should crocodilian farm-

ing be legalised. As a signatory to the Convention on the International Trade in Endangered Species of Wild Fauna and Flora (CITES), all shipments of endangered wildlife and wildlife products are accompanied with numbered tags, and every country receives an export quota from the CITES secretariat. As such, it is virtually impossible to fool the system, which has been shown to work even in countries

of South America and Africa where law enforcement is less than perfect.

Whether we like it or not, the economics of some of the wildlife sustainable utilisation projects has been shown to be viable. On account of ecothermy in turtles and their adaptability to captive conditions, turtle farming has been shown to be more economical than cattle farms in South America. A one acre lake with the

### Farm a crocodile and save a tiger

IN the wake of the CITES meeting in Harare, the Government of India has come under local and international fire for letting tiger and elephant numbers dwindle, and for voting against sustained usage of wildlife by countries which care for their wildlife heritage.

There is light at the end of the tunnel though, as long as a dialogue can be initiated. The government and a section of environmental lobbyists, claim that India does not have the requisite infrastructure to deal with control of wildlife usage. Our contention is that enough money can be generated through crocodile farming to pay for crocodile, tiger and elephant conservation in the wild and for management of habitats.

How can it be done? This is the plan, and if it sounds naïve and uninformed, first stack it up against what is now being accomplished to save these animals and their habitats:

1. Crocodiles would be encouraged to breed again at farms like the Madras Crocodile Bank and other state farms where sexes have been separated and eggs destroyed for several years to disallow further breeding.
2. Hatchling crocodiles would be reared by an organisation set up especially for the purpose for two to three years till they reach the size preferred for leather goods.
3. The crocodiles will be fed on rats caught from rice fields, thus saving rice and giving employment to the Irula tribals and other communities among the so-called 'weaker sections'.
4. Crocodiles reared to about 1.5 m in length would be humanely slaughtered and virtually all of the reptile used for leather, protein production and other by-products.
5. Skins would be exported to Japan, France or Italy, the CITES signatory countries which pay the best prices for raw crocodile skins. Once the system proves to be workable, skins can be tanned and fine leather articles made in India to benefit Indian craftsmen and industry.
6. Each skin would be 'tagged' with an unreproducible magnetic number tag which can be simply read with a device similar to that used to read bar codes in a supermarket.
7. Meat would be consumed locally by Irulas and other local communities who appreciate the value of high protein, low cholesterol meat. This white meat has a high export value.
8. After covering all the overheads, the profits realized from the export of crocodile skins would be channelled into the conservation network: primarily NGOs with a proven track record of working successfully with the Forest Department and the people living in and around wild habitats (this concept obviously needs expansion and plenty of simple, imaginative input).

We estimate that by the third year a crocodile farm the size of the Madras Crocodile Bank, can produce 15,000 skins per year with a gross income of Rs 7,39,20,000 and an annual net profit of Rs 2,51,70,000, much of which could be directly used for protection of wild crocodiles, tigers, elephants, their habitats and research.

Does this sound radical? Not at all; plenty of other countries have done similar things for decades. We are talking of an industry that has 40 years of history with remarkable success, and good, healthy, wildlife populations to show for it.

It's time for an urgent dialogue on this issue. It's not a hornet's nest nor a Pandora's box. What we're talking about is practical wildlife management that works because it's dynamic and it is pro-people. What we've been trying to do in India so far has always been anti-people, unimaginative, and without adequate resources. It's time for a change! Why does India have to depend on overseas funds to conserve its own wildlife heritage?

**Romulus Whitaker and Harry Andrews**  
Madras Crocodile Bank

giant South American turtle (*Podocnemis expansa*) can produce approximately 440 times more meat—22,000 lb/acre/year, than a one acre cattle pasture—50 lb/acre/year. Techniques for the mass culture of freshwater turtles are now developed. The use of by-products, such as bones and cartilage for the manufacture of chicken and fish feed, glue, fertilizers and soup stock has the potential to increase the economic viability of freshwater turtle farms. Integration with tourism would help cut overhead costs of running farms for many reptile species, as shown by the Madras Crocodile Bank, which, unlike all government-run zoos, actually generates a profit.

**F**lesh of the *mugger* is consumed by many indigenous groups in India, and can be a cheap source of proteinaceous food for other economically backward sections of the local community, perhaps also a delicacy for the more affluent city folks. The leather can be locally processed and leather products made for export. The illegal nature of reptile skin trade at present makes it impossible for leather-goods manufacturers to use these skins for the production of quality products, although the region has one of the world's finest leather goods industry. Crocodilian farming/ranching technology involving a variety of species of crocodiles and alligators, exists in the region and elsewhere in the world, including Australia, USA, Indonesia, Zimbabwe, Papua New Guinea, Mozambique and Botswana. Basic biological information on all three South Asian species is now known. With all species breeding regularly at one or more of the 17 breeding centres in India and the high price of 'classic' category crocodile skin—US \$8-10 per cm belly width—crocodile farming is feasible.

The Madras Crocodile Bank Trust, India's largest crocodile farm,

maintains nearly half of India's captive crocodilians. Most of these are muggers, which produce on average 10,000 eggs per year. Research at this facility shows that a stock of 50 females and five males would produce an average annual harvest of up to 1,200 crocodile skins in its fifth year of operation. Mechanisms exist to control the illegal trade in crocodilian products from countries that produce crocodile skins, and raw or tanned skins can be exported only from licensed farms, each with a non-reusable numbered tag supplied by CITES. Utilization of the meat, oil and glands could add an additional 30-50% in export value.

Development of buffer zones around protected wilderness areas can provide some compensation to communities who have lost traditional harvesting rights through the establishment of the reserve. Buffer zones in the National Chambal Sanctuary, which runs through central India, for example, can be opened up to local fishermen and farmers for limited harvesting of turtles and turtle eggs.

**T**he olive ridley sea turtle (*Lepidochelys olivacea*) is the commonest sea turtle on the East Coast of India. It produces on average 100 eggs at a time, nesting as many as two to three times a year. At Bhitarkanika and near the mouth of the Devi river in Orissa, the world's most important *arribadas* (nesting aggregations) of this species occur seasonally, where an estimated half a million turtles lay 50-100 million eggs annually.

The eggs of the olive ridley are nutritious, weighing about 23.5 to 34 gm each. Prior to the establishment of the sanctuary at Gahirmatha in 1975, eggs were collected from the rookery after payment of *anda-kara* (egg tax) to the Kanika *zamindars* (landlords) and subsequently to the Orissa Forest

Department, for sale to the economically poorer communities along the rivers Brahmini, Baitarani and Dhamra, as also for export to the Calcutta markets. The legal egg consumption per year is estimated to be as high as 1.5 million, with the actual number almost certainly being much higher. Issuing of licenses ceased in 1975 with the declaration of Bhitarkanika as a wildlife sanctuary, and the personnel of the Forest Department prevented all egg-collectors from entering the reserve.

**T**he low hatch reported from wild nests in Gahirmatha was attributed to the selection of nests that are located at the low and mid beach zone. Being close to the spring high tide line, it resulted in loss of nests due to erosion. Sea water is known to cause suffocation of the developing embryos and disrupt egg metabolism. Thus, an animal resource that is a protein-rich food has been lost. Studies need to be undertaken to examine the feasibility of a limited harvest of turtle eggs from ridley beaches where erosion destroys nests and/or where re-nesting later in the season exposes eggs laid earlier (it should be noted that the second nesting does not take place in some years). Removal of eggs should only be for local consumption from sites well below the known erosion points. It should be carefully supervised by the personnel of the Forest Department.

In the end, truly sustainable projects concerned with wild resources can succeed only through the efforts of relevant government departments, NGOs and especially the target community. Community involvement is the key to the sustainable development projects suggested and agendas should include the viewpoints and aspirations of the common man.

# Wildlife research

R J RANJIT DANIELS

AS I began to write this article, my attention was drawn to an American poster on conservation of 'nongame wildlife' with a picture of a frog sitting on a leaf! Although by this distinction lesser vertebrates such as amphibians get included, the term wildlife is still used in a restricted sense.

Wildlife, in general, stands for certain vertebrate animals – mammals, birds and larger reptiles. Take for example the US Fish and Wildlife Service. From the title it is clear that fish are not automatically treated as wildlife. Or, consider the renaming of World Wildlife Fund as Worldwide Fund for Nature. People are a little touchy about using the word wildlife to cover the entire spectrum of macro organisms – plants, invertebrates and vertebrates. Wildlife is apparently represented by a smaller component of the earth's biological diversity, at least in common sense. And, wildlife wardens continue to be people who are not trained to conserve medicinal plants or ants!

The rather narrow definition of wildlife has also restricted the sphere within which wildlife biology is

taught and researched in India. Students who obtain degrees in wildlife biology rarely choose to work on invertebrates and lower vertebrates (fish, amphibians and smaller reptiles). For a majority of Indian students, wildlife research is a source of adventure and excitement. It is certainly more exciting to track down and radio-collar a snow leopard or an ibex in the Greater Himalayas than study the social behaviour of bonnet macaques in the suburbs of Peninsular India. Nevertheless, much of the adventure and excitement is at the expense of adequate sample size and consistent data for meaningfully interpreting field observations in wildlife research.

Adventure does complement good science. But it demands more time, money, appropriate methodology and infrastructure. As such, the progress of wildlife research in India has been severely handicapped by all these constraints. Research projects are of short duration (mostly 3 years, rarely 5 years at a stretch) and inadequately financed. The sad result is that researchers are forced to make

compromises in adopting field techniques. The best techniques are not practical under these constraints. The situation is further worsened by lack of infrastructure (especially in universities) and the difficulty in obtaining the required permits from the government to undertake the study.

**T**oday, in India, we require a permit to collect even a frog from within a protected area. How much does it take to radio-collar a tiger? The use of radio-collars in wildlife research, even on a limited scale, involving just a handful of species of large mammals, has for the first time provided authentic data on habitat use, territory size and home range. Some data have been obtained on patterns of mating as well. With great difficulty a tiger or an elephant can be radio-collared. But this unfortunately happens towards the end of the project. And as the projects come to a close, animals carrying live radio-collars can be seen wandering about without being monitored for valuable data.

Estimates of wildlife population in the past had largely been arrived at (and continue to be) through indirect means. The use of spoor (pug and hoof-marks), scats, trails/tracks, nests and other clues permit a wide range of estimates of population size of such animals as large snakes, crocodiles, turtles, birds and mammals. Although the magnitude of error in such estimates has not been worked out on a case by case basis, except for tigers when pugmark census is used, it is often claimed that these indirect methods are among the most reliable means of wildlife population estimation.

Direct methods of population estimation have relied on the use of line transects, mark-release-recapture of animals, and photographs for individual identification, especially the

use of camera traps at night. Whereas many wildlife researchers favour mark-release-recapture as a method for reliably estimating population size (also movements and longevity), it is complicated by the issue of obtaining permits to trap, handle and mark animals.

To cut a long story short, I wish to rather rudely highlight the sad conditions that wildlife research in India is conducted. Data accumulated are frequently opportunistic and hence inconsistent between observations and observers; not substantiated by cross-checking using alternate or complimentary methodology; not amenable to stringent statistical analysis; and limited to a handful of animal species and sites for which permits are more readily issued. They are, thus, of little value (with exceptions) to conservation planning.

**T**he sorry state of the knowledge of wildlife populations in India came to light after a series of Conservation and Management Plan (CAMP) workshops that were held countrywide, covering a range of organisms. With few exceptions, there is a dearth of reliable data on population and status of even such well-studied components of wildlife as birds in our country. About a year ago, I had the privilege of seeing the largest bird database in the country – the data accumulated over the years by the bird ringing programmes of the Bombay Natural History Society. This large database, unfortunately, is the best example to illustrate the first three types of shortcomings, listed above, that the data on Indian wildlife has consistently suffered from. It may well be argued that much of the bird ringing data – the data is of the mark-release-recapture type – was collected at a time when quantitative study of wildlife was not given importance in India. Nevertheless,

what is to be lamented is the fact that despite the tremendous transition (qualitative to quantitative) that Indian wildlife research has undergone in the recent years, these shortcomings have not been addressed and overcome.

**W**ildlife conservation relies on the data sources that research builds up. However, in India, the channel between wildlife research and conservation is a bit too clogged. How many of our conservation efforts, plans and design are based on primary data? It is true that most of our wildlife reserves were designed *ad hoc* due to a perceived urgency. But, what efforts have been made by the wildlife managers to redesign, modify or alter the existing management systems based on the recommendations that wildlife research in the country has produced?

On occasions, such as when seeking permits to do research, well meaning forest officers cite various thesis, reports and publications on Indian wildlife, and retort by asking: who wants to know the time activity budget of otters? Can we not study wild dogs without radio-collaring them? Is it absolutely essential to collect frogs for identification? This is simply duplication of work already done! This is a clear indication of a wide gap between research and the needs of wildlife management.

The gap between wildlife research and conservation in India needs to be bridged. This can happen only when the managers (the Forest Department) and policy-makers are able to see the purpose and validity of both the research and the recommendations. Articles on population decline and its possible consequences on the genetic structure of mega animals such as tigers, lions and others appear in science magazines

and journals from time to time, offering recommendations for improved management. Yet, how much of this is based on first-hand scientific data? Are we not relying on general wisdom derived from the global arena? Isn't this why many of the conservation and management strategies are in conflict with the local situation and realities?

**W**hile it cannot be denied that (at least in India) prejudice can preclude the applied value of good research in wildlife conservation, it does help when we make a distinction between what is purely academic research and that which has immediate applied value. By purely academic, I mean research that is targeted towards a publication in high impact international journals which insist on results being novel, and of wider interest. Examples of such research can be those exploring the scope of using radio isotopes in estimating the age of elephant bones, the use of traces of DNA in animal faeces for identifying individuals (and thus the genetic variability in a population), identifying the source of confiscated crocodile skins based on DNA samples and the like.

Frankly, while not denying that such research does have considerable applied value, I am unable to see the immediate use of these research findings in conserving Indian wildlife. This feeling is not uniquely mine. It is more widespread in the country than we imagine. And as more and more wildlife biologists graduate in this country and with a decline in per capita funds available for research, there is an urgent need for serious rethinking on what is high priority wildlife research.

Prioritisation of wildlife research is possible only after some concerted stock-taking is done. Hundreds of postgraduate and doctoral theses

on wildlife lie scattered all over the country. What do these theses contain?

**O**ne of India's widely read newspapers (The Hindu, 13.3.98) carried an article on the decline of tigers worldwide. It stated that the reason for killing tigers is not known! A couple of recent news articles highlighted the plight of elephants in Periyar. That there are more females, 100-120 females to every male elephant, in the reserve was a major concern. What will be an appropriate research and management design that will help conserve this population of elephants? Shouldn't these be issues that draw the immediate attention of wildlife biologists and managers?

The other problem commonly encountered in India is that wildlife research undertaken by different researchers and institutions rarely complements each other. For instance, we may consider research on the Indian elephant. Probably the most detailed study of any large mammal in India is that of the elephant. I know of three independent researchers who have worked at more or less the same time in a small area, often encountering the same herd! The results and conclusions drawn from these studies, however, were not quite complementary. Sadly, no serious effort was made to openly discuss the strengths and weaknesses of the different field methods adopted in the studies and draw generally acceptable inferences that could be of help in the management of elephants in South India.

There are numerous such examples of conflicts between Indian wildlife researchers (although this is not unique to wildlife biology) that offer further scope for wildlife managers and policy-makers to criticise researchers and take their own course of action when it comes to conservation.

A transition from a hard approach of studying only megavertebrates under the banner of wildlife to including lesser organisms is taking place in India. Whether this is result of genuine concern for lesser animals or due to pressures of funding is not readily apparent. It is certain that most funding agencies in India do not encourage studies which exclusively deal with megavertebrates. Whatever be the reason, as mentioned earlier, wildlife biologists are beginning to include the study of insects in their array of choice organisms and this is an encouraging development.

**T**he transition has unfortunately also had some unexpected consequences. It seems that the scientific standards for wildlife research in the country are to be further compromised. Biologists with very specialised training in research and conservation of large mammals and other megavertebrates such as crocodiles have had to co-ordinate and monitor projects that primarily deal with the field study of insects, amphibians and other lesser animals. The result is that there have been methodological complications, including the most fundamental, relating to identification of species. A greater reliance on secondary sources of support in taxonomy for the identification of lesser animals has often driven students of wildlife biology to disregard their research guides.

Statistical and computer applications in wildlife research has become the ultimate tool to a wide range of students in the country. Students of wildlife biology casually ask for help in statistical analysis and interpretation of data, often insisting that ANOVA is done irrespective of what the data is! When queried, they justify it by stating, 'My research guide wants it.'

Wildlife research which once suffered from methodological con-

straints is now going through a phase of ad hoc adoption of methodology. Few institutions that offer courses in wildlife biology also teach research methodology that is relevant. Rarely does a student carefully plan his field study with an awareness of the limitations of existing 'standard' methodology and the relevant statistical techniques for analysing the data. The normal practise is to first design a study according to one's convenience, and at the end of the study to look for available statistical tools to analyse and interpret the data.

**W**hat is happening in the field? It is heartening to see wildlife research graduating from natural history to more quantitative studies of population structure and dynamics. The use of line transects to estimate population size of selected species of animals is becoming popular. Quite a few Indian researchers are now familiar with the statistical packages that aid in the analysis and interpretation of population data obtained using line transects. However, it is the over-reliance on such tools that is troubling. The line transects help to estimate of population sizes of individual species only after certain basic assumptions are made. Assumptions such as 'the animal does not move in response to the observer', are rather hard to swallow. While there are procedures to correct some of the biases that creep in while conducting a field-census, rarely do students/researchers take care not to violate some of the basic requirements of the programme. The most commonly violated norm while conducting transect census in the field is not maintaining a straight line. Such a deviation can lead to violating other norms, that no animal is counted twice and so on.

The case of using line transects is only illustrative. Several such tools,

available for field studies in wildlife, are used in India by students/researchers. The unfortunate fact is, that a number of ad hoc adjustments/modifications made to the standard tool are never treated with caution while analysing the data using a computer package. 'Junk in, junk out', although a very popular phrase among wildlife biologists, has to a large extent failed to sensitise field researchers.

Research methods often promoted as 'standard' internationally need not always be applicable in our country. They often need to be appropriately modified to suit the species of our choice, the habitat, the observers' skills, time available, levels of visibility, and the manpower/infrastructure. There is nothing wrong in this. However, failing to acknowledge this and feeding the data thus collected into a standard pre-fabricated computer package and interpreting the results in consultation with prevailing knowledge is dangerous. While such problems are not unique to wildlife biology, errors due to observer bias tend to get magnified more readily in field data than in laboratory experiments.

**W**ildlife research and conservation in India must clearly identify priorities. The first step towards meaningful management of wildlife is to broaden its definition to highlight the fact that megavertebrates are components of a much larger biological system. This is already happening, with students of wildlife biology currently taking interest in butterflies, insect pollinators, corals, amphibians and small reptiles. While it is heartening to see the transition, the progress in wildlife research is slowed down more by lack of appropriate design and methodology than the availability of funds. In fact, a carefully designed study is fundamental to the

most economical use of the available funds and manpower. A vast majority of us (wildlife researchers and managers) need to be trained in this regard.

**W**ildlife conservation is a mission and cannot stop with an academic breakthrough. Every effort should be made to validate research findings through appropriate alternate methodology and economically utilising financial and human resources. Wildlife research and management should be interdisciplinary and integrated. Such programmes should attract long-term national or international funding. Long-term conservation programmes should have their objectives clearly stated, priorities defined, design worked out, and research methodology appropriately adapted and executed. An appropriate research methodology, in my opinion, is the principal factor that can bridge the gap between wildlife research, management and conservation in India.

Wildlife conservation can be effective only when authentic, time-tested research findings are applied. Snapshot recommendations and an excessive dependence on common wisdom derived from the global knowledge pool can be misleading. Time and again we read of megavertebrates and their population decline. At the same time research papers in scientific journals (*Current Science*, vol. 73, 1997, p. 841) claim that, 'The tiger and Asian lion are making news all over the world. All is not lost; the good news is that both are fast breeders.' How sure are we? Does this happen in the wild? Who has the data? Just another example of common wisdom prevailing over scientific reason. Little wonder that wildlife research and conservation in this country are only limping along.

# A great legacy dissipated

M. KRISHNAN

TO have a fair idea of the present worth of our wildlife preserves (of all kinds: sanctuaries, national parks and other protected habitats) and to know what further steps need to be taken to effectively safeguard our heritage of nature, it is necessary to take a quick, overall look at the past. Many of these preserves were set up long before Independence, in British India and in the princely states – well-known examples are Vedanthangal in Tamil Nadu, Bandipur in Karnataka and Corbett Park (our first authentic national park, set up in 1934) in Uttar Pradesh.

Soon after the *shikar* statutes that followed Independence, the Indian Board for Wild Life was constituted, a number of fresh preserves were created (some quite major ones) and conservation tightened. Illustrative examples of this are the metamorphosis of Keola Deo Ghana at Bharatpur in Rajasthan from a wildfowlers' paradise into the most important water-bird sanctuary in Asia in

1956, the Point Calimere and Anaimalai sanctuaries of Tamil Nadu, and the intensification of conservation in the Gir Forest of Gujarat (the last home of the Asiatic lion) and in Kaziranga in Assam (the major stronghold of the Indian rhinoceros and the no less Indian wild buffalo). The trend has been continued right into the present: Sultanpur Jheel in Haryana, another favourite resort of wildfowlers, was converted into a fine sanctuary recently and the ambitious Desert National Park of Rajasthan was initiated earlier this year.

We now have almost 150 wildlife preserves, big and small, all over India. But neither the old nor the new preserves have taken note of the basic fact that the wild vegetation is as integral and vital a part of the wildlife of any region as its fauna. In 1970, with the acceptance by the central government of the definition of 'wildlife' as the entire uncultivated flora and fauna of a tract, this profound truth gained formal official recognition – it still awaits recognition in the field. In fact, our wildlife preserves have all been set up solely for the larger animals, and a few for water-birds, and the flora has been considered purely incidental, as providing cover and

\*Reprinted courtesy of *The Illustrated Weekly of India*, 24 August 1980.

Though written nearly two decades ago, Krishnan's overview of the history and prospects of wildlife conservation in India remains relevant.

fodder, and the lesser life not considered at all.

Hydel projects have been sited close by, even right inside, some of the best preserves. With a few exceptions, diverse forestry operations (all highly destructive of the natural vegetation) are carried on in our preserves, with even the supply of raw materials at subsidised rates to industries from them undertaken: cattle grazing, the collection of firewood and forest produce and other human activities are permitted, motor roads intersect the preserves, and human traffic on foot (highly unsettling to the wild animals) allowed. All our wildlife habitats (including all preserves) are solely in charge of our various governments: naturally, then the responsibility for protection is entirely theirs, and even otherwise only governments have the sanction necessary for protection. It follows, inescapably, that by their permissiveness, our governments have been the chief depredators of our wildlife.

**A**ctual, factual evidence as proof of every generalisation made so far in this overall survey of the past is on record, but the detailing of even selected examples of such proof will take up this entire issue of the *Weekly*, and the rest of the brief space available to me is needed for constructive suggestions for the future. But before going on to them, let me comment on the outraged defence of their past policy and administration that governments are likely to raise on this criticism, that they have been preoccupied with more important things such as providing for the elemental needs of our growing populations and industries.

Yes, I do realise that they have had that Sisyphean task right from the start, but then all our preserves together constitute only about one per cent

of the total land area. Surely they could have provided for our populations and industries with the overwhelming percentage of the land not given over to wildlife at their disposal. Furthermore, conserving the wealth of nature we still have left is also an elemental national need: Much needs to be done towards more realistic conservation to rectify the apathy and wastefulness of the past, and it has to be done right now – to delay further is to be assured of not having enough worth the saving.

**T**hat is the counsel, not of despair but of hope. The depletion of the past 50 years has been staggering: places noted for their wildlife within my own recollection are now denuded and bare and their animals have declined to rarity, even to local extinction. But the wonderful, the heartening thing is this – in spite of everything, India is still second to no country in its wild fauna, and perhaps the richest in its flora. Though heavily depleted, our fauna is still there, and notably free from exotic introductions: that cannot be said of our exotics-ridden flora, but it will regain its pristine glory if conserved, that is, if left alone and allowed to regenerate.

The policy of leaving well alone and of manfully resisting the almost overpowering urge to improve on nature has been proved to be the best, actually the only sound policy in conservation. This was called trust in the balance of nature in the past, and is now termed total environmental conservation, and it will suffice to ensure the future of our wildlife. It means emancipating preserves of viable area from all forms of human exploitation, and the provision of strict protection (now sadly lacking) against human disturbance and depredation. That is all that is needed, but since natural regeneration is a slow process, pati-

ence and faith are also needed. Incidentally, it is only in the few reserves of Project Tiger that total environmental conservation is now being attempted, after a fashion.

**I**n the past decade, governmental cognisance of responsibility for the country's ravaged opulence of nature has displayed a certain nascent perception. The Wild Life (Protection) Act of 1972 is constructive, if only for its insistence on a specific wildlife organisation in each state, and it is the first realistic attempt at a national policy of conservation. There are other tokens of awakening governmental concern for our wildlife, even of awakening public concern in a minority of our people, but for the next generation at least governments must bear the entire responsibility for protection.

Today, there is no informed popular interest in our culture, in our magnificent assets of nature. The human and natural curiosity of our children in the wild things around is sternly nipped in the bud by our traditions of life and instruction instead of being informed and stimulated. In the West, with a comparatively small store of wildlife, the great therapeutic value of such an interest in relieving the stresses and frustrations of civilised life has been fully appreciated after the last World War: wildlife recreation is widely organised and popular, and education at all levels features nature importantly. With no reliable natural history in the written or oral literatures of our languages, and no popular feeling for it, it will be no easy task to inform and stimulate this dormant interest in our people, particularly in the younger sections. But this is a vital national need and will endow future generations with a joy and sustenance in life that we have been without.

If I have only conveyed the impression so far that it is of national importance to conserve our wildlife and wildlife habitats, I have failed fundamentally in my argument. This is no matter of mere importance, but a primary patriotic duty, quite essential for the survival of the identity of this ancient country. Surely no country depends for its identity mainly on the conglomerate accretions of its cultural past or its mutable humanity – it depends overwhelming on its own peculiar physical integrity, its geomorphology and the flora and fauna that belong to it distinctively. Oddly enough, it is our poets and not our rulers or politicians who have realized this profound truth – it is they that have sung of our mountains and valleys and rivers, sounding seas and vast coastlines, great forests and lovely flowers, and of our birds and beasts.

The dissipation of India's physical integrity has now reached the stage where further indiscriminate demands on its natural resources will certainly erode its very identity. For this reason, it is imperative that adequate tracts, typical of the country's quiddity, should be freed from human exploitation and protected efficiently. Only that can ensure the continuance of India's identity. With our vast populations and growing industrialisation, it will be unrealistic to ask for much territory even for this vital national purpose, but a modest five per cent of the total land area should suffice, in the circumstances. Naturally, this will include all existing wildlife preserves, so that no further demands need be made on our forests; for the rest it will embrace notable geomorphological features and areas not provided for so far in our wildlife effort, such as swamps, estuaries, offshore islands, mountain tops and, by no means last, adequate expanses of plains for the wildlife of the open country, now so sadly lacking sanctuary.

## Fatal links

VALMIK THAPAR

'WHY can't we save the tiger? Why can't we save our parks? What is the problem?' I am endlessly asked. Rhetorical questions, but how many of us understand the mechanisms that are supposed to *govern* wildlife?

Because of a preferred ignorance about nature and her ways, wildlife conservation has become a dirty word for most people. A mere mention sets off a furious debate about 'elite armchair conservationists', 'eco-fascism', 'people's rights', 'deprivation of tribals', or forest dwellers' 'indigenous cultures' and much more. While this battle between different lobbies

rages, a part the wildlife and wilderness of this country vanish each year.

Sadly, the reason is that we are engulfed by an ignorance of the value of nature. Whether politician, bureaucrat, conservationist, NGO, tribal, villager or activist—everyone is obsessed with the jargon and fashions that encompass the processes of keeping alive the great storehouses of natural treasures in our country.

**F**ew go beyond the jargon. The concepts that governed sacred groves are being lost forever. For most politicians, bureaucrats and businessmen ignorance is bliss since it makes it easier to exploit the natural treasury. Everyone has a rationale, everyone has a solution, everyone justifies their lobbies and vested interests, but few serve the cause of nature or wildlife. Few care that endless rivers are born in the tiger's forests and that these tiger habitats are probably the most important water catchment areas left in the country. Hundreds of rivers, rivulets, streams, *nallahs* are born in wildlife areas and serve the essential purpose of providing life to millions of people in their vicinity.

Few know that national parks cover only one per cent of India's land mass and not even these are inviolate. The laws that govern our natural resources are continuously flouted. Few care that the fragments of natural treasures that remain are some of the most vital reservoirs of medicinal knowledge known to man. Few care about our priceless wilderness. Even the so-called sensible activists who propogate the involvement of local communities in the management of our protected areas are ignorant of the ground realities.

Most people have their personal agendas. And as the debates rage, the wilderness gets looted and pillaged. For those who exploit, it is a moment

to swallow more and more of these treasures, which are not only easily convertible into cash but probably so valuable that some would call them priceless. It is one of India's greatest tragedies that because of this preferred ignorance no consensus is reached on conservation, making it convenient for those who rule. They have set a perfect stage to pick and plunder at their whim and fancy. It is done on the excuse of so called 'development'—a word used as a guise to cover every exploitative activity. Let us look at the actual working of the system's involved in wildlife conservation and try and understand how this depletion of our natural treasury occurs.

To reveal the inability of both the Centre and state governments to function in the interest of wildlife, I will examine in detail the example of one state. Madhya Pradesh is supposed to have excellent forest cover, the maximum number of tigers in India and, on paper, the political will to translate policy into field action. M.P. had nearly 30% of forest cover and 15% of the world's tigers. From the period starting 1992, I will try and highlight specific examples of policy and decision-making.

**I**n 1992, the minister for environment and forests was closely linked to the man who was to be the future chief minister of Madhya Pradesh. They could have been the most effective duo for protecting the natural heritage of Madhya Pradesh. Our story starts in 1992, when a tract of forest that fell in the minister's constituency was declared a Project Tiger reserve. One thought that the minister would set an example and make Pench a model for our tiger reserves. I had just been appointed to the steering committee of Project Tiger and was beginning to learn the ways of the system that govern the natural heritage of this country.

Fishing was prohibited in Pench as it was a national park and therefore covered by the Wildlife Protection Act (1972). The following clause of the act applied to the area:

'No person shall destroy, exploit, or remove any wildlife from a National Park, or destroy or damage the habitat of any wild animal, or deprive any wildlife animal of its habitat within such National Park except under and in accordance with a permit granted by the Chief Wildlife Warden and no such permit shall be granted unless the state government, being satisfied that such destruction, exploitation, or removal of wildlife from the National Park is necessary for the improvement and better management of wildlife therein, authorises the issue of such permit.'

**B**ut we have become masters of using the law and the grey areas in it, and the above clause 35(6) of the Wildlife Protection Act has been much abused. In this case a joint secretary in the Ministry of Environment and Forests initiated a process and faxed the principal forest secretary of Madhya Pradesh, stating in relation to the rights of fishermen:

'As per information available in this ministry, the aforesaid formalities have not been duly completed in respect of Pench National Park and the final notification is yet to issue. If so, fishing rights of the local people cannot be abridged without compensation and lawful acquisition and would have to be continued till the formalities laid down for acquisition of rights are completed.'

This fax message was like a missile for the state government and they must have wondered if the *makers of the law* were turning into the *breakers of the law*. After all, everyone knew that it was only 10 years ago that a dam was constructed in the area and 50 sq km of forest cleared for the

water reservoir in the heart of the national park. Since this was so recent, there was no question of any traditional fisherman or traditional fishing rights in this entire expanse. But the central government had opened up a hornets nest as far as the issue of rights was concerned and questioned the very basis of the national park. It was all about the millions of dollars worth of fish in the water reservoir and every fishing mafia in India wanted their bite of flesh, whether through 'traditional' fishing rights or any other way. The lobbies had begun to work, taking their cue from the Ministry of Environment and Forests' first message.

**F**or over two years this issue went back and forth between central and state government, since to permit fishing under the laws of this country was not easy. Towards the end of 1993, a new chief minister of Madhya Pradesh was in the saddle. But in the interim the minister of environment and forests made all the right noises.

In September 1992 he wrote to the chief minister of Madhya Pradesh:

'Madhya Pradesh can boast of the single largest population of tigers in the world (more than 900), which constitutes one-fourth of the country's, and one-sixth of the world's wild population of tiger. Three-fourth of the 45 districts have substantial forest cover. Madhya Pradesh could rightly be called the "Tiger State".

I have been discussing this with some experts, including members of the Steering Committee of Project Tiger and other wildlife lovers. I feel that we could develop a whole new approach for the conservation of biological diversity and natural resources, as well as the socio-economic development of people, particularly tribals and forest dwellers in Madhya Pradesh by using tiger conservation as a means.'

We have become masters of rhetoric. The chief minister accepted the concept and created a tiger state committee, to which I was appointed, to work out a detailed strategy paper. By 1995 the process was well underway – Madhya Pradesh was declared the tiger state and was to adopt all-round policies friendly to tigers, including setting up a tiger cell which was formed at the police headquarters to deal with poaching and illegal trade.

**A** lot of excellent rhetoric spewed out over the next year. Both the minister of environment and forests and the chief minister of Madhya Pradesh wrote splendid responses on different issues, but it was all paper work without any field action. To a detailed proposal prepared by a colleague and myself on what the tiger state should be doing, the chief minister responded:

'I thankfully acknowledge receipt of your joint letter dated 5 September 1995. The concern expressed in your letter, certainly, strengthens our resolve to intensify the efforts in the protection and preservation of wildlife and particularly of the tiger in Madhya Pradesh. Due to limitations of financial resources, I understand that some of the recommendations made by the Tiger State Committee could not be implemented so far. However, arrangements are being made to provide better communication facilities such as fax machine in the office of the Addl. PCCF (Wildlife). Wireless sets have already been provided to the National Parks. The authorisation for the use of fire arms by the forest staff in sensitive areas are being examined, on priority. The formation of the Tiger Cell in the PHQ and the co-ordinated efforts being made by the police and the forest officers at the field level have turned the heat on the poachers. We intend to keep up this pressure without any relent. The Chief Wildlife Warden, Madhya

Pradesh informs me that the next meeting of the Tiger State Committee is being planned in October 1995. This forum should enable you to interact more closely with the other members of the committee as well as officers of the forest and police departments in giving further shape to the anti-poaching drive. I look forward to your continued support on this noble cause and welcome suggestions for improving our approach in this endeavour.'

We only managed to get one fax machine for the chief wildlife warden's office!

**T**he Union minister also gave some splendid suggestions to the chief minister. In a letter in May 1995 he stated:

'Here are some immediate steps we could take.

(a) dramatically step up intelligence, patrolling and arrests to force the gangs to suspend operations till we have time to regroup our efforts to stamp out the menace;

(b) place all known and habitual wildlife poachers under arrest and oppose their release on bail;

(c) consult with the Chief Wildlife Warden before transfer of any forest or police officer serving in a tiger area, or involved with the M.P. Tiger State Committee, because sometimes, by pure coincidence, a transfer takes place immediately after a seizure and this conveys the wrong signal that the poaching mafia has influence in high places;

(d) consult the Law Department on the possibility of codification of firearms for forest staff so that the 800 weapons lying in the armouries can be used by them against poachers. We should also instruct them to brief us on the feasibility of enhancing punishment in the acts to a minimum of ten years of imprisonment, making the offence non-bailable. I am instructing my officers

to advise me along the same lines for central legislation;

(e) issue instructions to all territorial DFO's and CF's about prioritising the protection of the tiger. CWLW must be authorised to make entries in the confidential report of these personnel, in addition to the normal channels;

(f) allot four HF frequencies to the Wildlife Wing for better communication, and two DFO's and three ACF's must be posted at the CWLW office in Bhopal for anti-poaching and strengthening tiger management;

(g) resource mobilisation must be immediately begun, particularly to acquire vehicles, fire-protection equipment and for reward schemes for informers.

On my part, I have immediately instituted similar steps at the Centre and will see to it that co-ordinated action is taken by the Tiger Crisis Cell at the Centre and the Tiger Cell of Madhya Pradesh. The back of the poaching gangs must be broken within the next four weeks, but I would like to ensure that the focus does not fall merely on the weakest link which happens to be the adivasis who actually use the poison or traps. We must get to the very top, or at least break the transport and trade links between Mandla, Jabalpur, Balaghat and Seoni.

**U**nfortunately, all of the above remained hot air. Meanwhile, the 'fishing' issue resurfaced and against the advice of the entire steering committee of Project Tiger, the boss of wildlife in India, the additional IGF (wildlife) wrote a letter to the principal forest secretary of M.P. in January 1995:

'We have been receiving several representations from people engaged in fishing in the Totladoh reservoir of Pench Tiger Reserve (soon to be declared as national park). The complaints are of two types:

On the other hand, it would not be appropriate to snatch away certain activities of hill and poor people, which may ultimately help in the improvement of bio-diversity of the protected area so that the traditional atmosphere of conflict between the park management and the local residents be replaced by a more co-operative interface.

The solutions to be adopted would, of course, have to be location-specific; in different sanctuaries and parks, the problems would be different; the bio-diversity would be different, the priorities would be different, and therefore, the solutions too would differ.

In the Pench Tiger Reserve, the Totladoh reservoir is an artificial one created due to the completion of a dam downstream about 8 years ago. This is not an *in situ* lake. So if any use of bio-resource of the pond could ultimately help in the improvement and better management of the reserve, by reducing their dependence on illegal felling of trees and poaching of wild animals, and also increasing the interface of local people with the park authorities — this may be explored as envisioned in Section 35(6) of the Wildlife Protection Act.

Note that the boss of Indian wildlife was now not even calling the Pench Tiger Reserve a national park. He was talking of a 50 sq km reservoir as a pond and in writing he was asking the state government to explore the *loopholes* in 35(6) of the Wildlife Protection Act.

**O**ver the next six months many members of the steering committee of Project Tiger wrote letters opposing this move. But the then director, Project Tiger failed to support his steering committee. At an evening function, he went up to the minister and remarked, 'I am glad fishing will commence in the tiger reserve — the World Bank will welcome it.' Since

part of the reservoir falls in neighbouring Maharashtra, the Government of Maharashtra took legal opinion and wrote to the state of Madhya Pradesh objecting to the entire happening:

'In 1975 the Government of Maharashtra vide its resolution No. PGS-1375/121748-F1 dt. 22/11/1975 has declared its intention to constitute an area of 257.26 sq kms as a national park to be known as Pench National Park. The area of submergence as explained in (1) above is included in this notification. The Law and Judiciary Department of Government of Maharashtra has given the opinion that all the provisions of the Wildlife Protection Act 1972 apply to the intended national park also.

The provisions of the Indian Forest Act 1927, and The Wildlife Protection Act 1972, in relation to fishing in the reserved forest and national park, respectively, are as follows: As per 26(d) of the IFA, trespassing in a reserved forest is prohibited. As per 26(i) of the IFA, fishing in reserved forest is prohibited. As per section 65(A) of the IFA, offences under section (i) are non-bailable. As per section 23 of the IFA, no prescriptive rights accrue over reserved forest except by succession etc.

As per section 35(3) read with section (20) of The Wildlife Protection Act 1972, after the issue of notification of intended national park, no fresh rights accrue over such area. As per section 35(6) of the Wildlife (Protection) Act 1972, destruction or removal of any wildlife or destruction or damage to habitat of any wild animal is prohibited except the activity beneficial to wildlife management.

From the above clarifications it would become clear that the submergence area of the reservoir is not only a reserved forest but is also a part of intended Pench National Park. Therefore fishing in the reservoir becomes violative of the provisions of both, the Indian Forest Act 1927 and the Wildlife Pro-

tection Act 1972, and is liable for final action under both the Acts.'

**B**ut none of this was of any use and on 30 May 1996 the chief wildlife warden of M.P. issued an order granting 305 fishing permits in the heart of the Pench Tiger Reserve. In his order he stated that he had been instructed by the chief minister to do so. The Maharashtra government once again strongly opposed this move, stating that the Madhya Pradesh government's interpretation of the Wildlife Protection Act was different from theirs. As a result two rules applied to the same water reservoir in which no fishing was permitted in Maharashtra while fishing was permitted in Madhya Pradesh. It was the perfect recipe for the mafia to force open the entire area and stir the activists into demanding their fishing rights. All the vested interests in exploiting the area had been perfectly massaged into action.

From the Centre, even the office of Project Tiger bent over backwards to use the grey areas and rationalise the 'fishing rights' of poor people. My opposition to this move was not appreciated and a senior official in the ministry whispered, 'District records can always be tampered with to create fishing rights.' I could not believe it. Suddenly the minister changed. I continued my opposition to what had happened in Pench and on the basis of my letter, the same boss of wildlife (now under a different minister) wrote to the principal secretary of forests, Madhya Pradesh:

'I am not sure about the authenticity of the statement made by the CWLW, Madhya Pradesh. I understand a large part of Pench Tiger Reserve is a reserved forest, and in a reserved forest no right of any individual can exist unless the same is recorded at the time of reservation process. Such record or

reference is normally reflected in the volume-I of the working plan prescription in the chapter that deals with rights and concessions of the local people. It may, thus be indicated whether any such right was recorded in the Pench Reserved Forest at the time of constitution of the reserved forest.

The demand for fishing in Pench is mostly coming after the Pench dam was constructed, may be about 10 or 15 years back. I am sure that such demands cannot be age old as the reservoir was not in existence earlier. So even if the final notification of the national park is pending and the process under section 19-26 of Wildlife Protection Act is yet to be gone through, the control of rights can easily be made with reference to the records of the working plan and admission or inadmission of such rights at the time of constitution of the reservation of forest, pending final notification of the national park.

Minister, Environment and Forest has pursued the note of CWLW, M.P. dated 10 July 1996 and he has observed that the remarks are evasive and ambiguous. I would, therefore, request you to furnish a specific reply in this regard within 10 August 1996 after which the case will again be placed to Minister, Environment and Forests for his orders.'

**T**he same officer under a different minister had taken a somersault, but this time the M.P. government was not going to be caught with its pants down. In a tough reply to the ministry (the first of its kind in ministry records) the additional secretary forests of M.P. wrote to the boss of wildlife, the additional IGF (wildlife):

'The perusal of the above letter makes it abundantly clear that the matter of traditional rights of fisherman was raised for the first time by the Government of India and it was at the specific

instructions of the Government of India that the state government examined the matter in the light of Section 35(6) of the Wildlife (Conservation) Act, 1972. For ready reference a copy of fax dt. 15/7/92 of Joint Secretary, GOI, Mr. S.S. Hasurkar and your letter dt. 17.1.1995 is enclosed herewith. It is clear from the perusal of these letters at that point of time, the state government was in favour of stopping fishing in Pench National Park area and was acting accordingly. But the state was compelled to change this stand due to GOI's instructions.'

**A** similar letter went from the chief wildlife warden to Project Tiger Delhi. Because of the differences between the Centre and state, and the inter-state problems over the use of the reservoir, the matter ended up in the Supreme Court. Everybody was against fishing – the state wildlife advisory board, the steering committee of Project Tiger and many other NGO's. As the Supreme Court debated the issues, activist organisations joined hands in support of fishing and the poor fishermen appeared in and out of court. The mafia lobbies, politicians and bureaucrats were thrilled that the tribal organisations stood on the same platform as them. I remember a senior aide in the minister's office telling me: 'You see now how others can be engaged to fight the battle.'

In all this confusion, the Supreme Court supported Maharashtra's ban on fishing, but permitted 305 fishing permits to continue in Madhya Pradesh till the final notification of the area. They also made a long list of stringent conditions under which fishing could be done. Now India had one large reservoir declared as a national park, administered by two state governments, in which fishing was banned in one half of the area and permitted in the other half! India's

Wildlife Protection Act had been interpreted in two different ways for the same stretch of water.

**T**he field director of Pench Tiger Reserve and his deputy were transferred for having done their duty to control illegal fishing. The new director of Project Tiger objected to the transfer, but now the state government was in no mood to listen to the central government. And though the Supreme Court had asked for immediate final notification of the area, two years later nothing has happened. In fact, there is immense pressure by fishing mafias on the Maharashtra government to open up the area to fishing, following the precedent of Madhya Pradesh. It is one big mess.

Another public interest litigation concerning Madhya Pradesh went before the Supreme Court of India. The case concerned the collection of minor forest produce in protected areas. The court was very clear about wildlife matters:

'The matter, however, does not rest there. The petitioner contends that the forest cover in the state of Madhya Pradesh is gradually shrinking. As pointed out earlier, there is a shrinkage to the extent of 145 sq km between 1991 and 1993. In our country, the total forest cover is far less than the ideal minimum of one-third of the total land. We cannot, therefore, afford any further shrinkage in the forest cover in our country. If one of the reasons for this shrinkage is the entry of villagers and tribals living in and around the sanctuaries and the national parks, there can be no doubt that urgent steps must be taken to prevent any destruction or damage to the environment, the flora and fauna and wildlife in those areas. If the only reason which compels the state government to permit entry and collection of *tendu* leaves is not having acquired the rights of villagers/

tribals and having failed to locate any area for their rehabilitation, we think that inertia in this behalf cannot be tolerated. We are, therefore, of the opinion that while we do not quash the order of 28.3.1995, we think that the state government must be directed to decide on the question of completing the process for issuing final notifications and then take urgent steps to complete the procedure for declaring/notifying the areas as sanctuaries and national parks under section 26A and 35 of the Act.

We, therefore, direct that the state government shall take immediate action under Chapter IV of the Act and institute an inquiry, acquire the rights of those who claim any right in or over any land proposed to be included in the sanctuary/national park, and thereafter proceed to issue a final notification under section 26A and 35 of the Act declaring such areas as sanctuaries/national parks.

We direct the state government to initiate action in this behalf within a period of six months from today and expeditiously conclude the same showing that sense of urgency as is expected of a state government in such matters as enjoined by Article 48A of the Constitution and at the same time keeping in view the duty enshrined in Article 51A(g) of the Constitution. We are sure, and we have no reason to doubt, that the state government would show the required zeal to expeditiously declare and notify the areas as sanctuaries/national parks.'

**Y**ears later no one is bothered by time deadlines or expeditious declarations and final notifications. Such are the priorities even after Supreme Court orders. There is little progress or urgency in final notifications. This delay keeps open the possibility of never ending exploitation of the forests of Madhya Pradesh by vested interests.

Madhya Pradesh has had the highest number of poachers caught, skins seized, and most of our poaching gangs operate across the state. Several hundred skins of different animals have been seized in the state between 1991-1997, including dozens of tiger skins, and over 100 poachers have been arrested. The state today has no mechanism to function in the tiger's interest and the central government has little interest in the entire happening. The tiger cell at the police headquarters desperately needs funds that are never allocated, such that its effectiveness is totally neutralised.

**T**he gravity of poaching was driven home to me when in 1995, at the height of the tiger crisis, a minister who 'served' the forests of India was given a gift from well-wishers in his constituency, which happened to fall in a tiger reserve. The gift was a tiger skin! I realised that if such gifts could be presented to the powers that be, there was little chance to effectively save tigers in Madhya Pradesh. There were several cases of the rich and politically powerful poaching, or their kin violating the sanctity of our laws.

Despite these problems plaguing the state, the government 'increased' the number of tigers in the 1997 census by 10, just to show progress. The great tragedy of this entire operation is evident from a letter the census co-ordinator wrote to his boss, the chief wildlife warden:

'As directed, the tiger/leopard population estimation figures received from the respective conservators, have been compiled along with the prey base and other related details. However, despite repeated requests, the pug mark tracings have been received only from a few circles. The circle-wise details are appended for ready reference. It is requested that the conservators may kindly be directed to keep a record of

the pug mark tracings pertaining to the estimation figures, as communicated by them, for future reference. In the absence of pug mark tracings from many circles, the tabulation being sent from this end amounts to a compilation only.'

**T**he so called tiger census, a game of numbers, was based on a methodology using the pugmark tracer. How could figures be even compiled without it? This reminds me of a time when the numbers of tigers, dead or alive, were a matter of much debate. I remember how a former director of Project Tiger addressed the tiger crisis cell, insisting that in the last 7 months only one tiger had been poached since this was the official information on the subject which had reached his table from India's bureaucratic maze. This figure was even placed before the Parliament.

But in these same years much more was afflicting the tiger state.

Under the Forest Conservation Act of 1980, the Ministry of Environment and Forests has a forest conservation act committee (one of the most powerful in the Ministry of Environment and Forests) which considers proposals for the release of forest land. This committee had released 230,000 hectares of forest land in M.P. since 1980. It was, however, in the last 6-7 years, that the maximum release of forest (tiger habitat) has taken place—160,000 hectares—for mines, dams, army firing ranges, irrigation projects or legalising encroachments.

The tiger state leads all the states in the Union in its quest for diverting forest lands. Let us look at some of the terrible violations that have taken place. A request was made by the state to release 3,000 hectares of forest land for a hydro-electric project from the Shivpuri forest division. The proposal was examined and cleared by the

Ministry of Environment and Forests. After all, the original application for this clearance from Madhya Pradesh clearly stated that in 1994 the chief wildlife warden of the state considered the area to *have no wildlife of any significance*. Further, the divisional forest officer recommended the diversion, even though Rs 5 crore worth of trees were listed as the value. But, the matter was much more serious, since all these were official comments on a national park! The land in question included a portion of Madhav National Park. The M.P. government, instead of clarifying this in its original application, had only stated 'Shivpuri forest division', and legal status as 'P.F. and R.F'. (which means protected forest and reserved forest). No mention of the national park!

**N**early every fact sheet from Madhya Pradesh requesting the release of forest land states that 'wildlife is of no significance.' This is how the Forest Department serves our natural treasury. Little did the central government realise that 1,500 hectares of this land had been notified as Madhav National Park. I discovered this fact on a visit to look at a dam site and the violations taking place in construction work. They immediately tried to stop the release when I brought it to their notice. In a letter to me, the additional IGF (wildlife) wrote:

'It is revealed that the permission granted for transfer of forest land for Sindh, Mohini Sagar Phase-II Hydro Electric Project was obtained by the Madhya Pradesh government without informing that the land forms part of the national park. Once it came to the notice of the central government that the land proposed for transfer is within the national park, the project was rejected and the state government was asked to fix the responsibility against the erring official.'

But the Government of India had been totally fooled and in the intervening period the irrigation project had spent more than Rs 80 crore, damaging the forest land in question with just under 5,00,000 trees. Even today the state government is least bothered about the central government ban on the Sindh Phase II project, and continues its work in the national park and on forest land. One of the most serious violations of the laws that govern our natural heritage had been detected, but how many go undetected?

**S**o far as hydro-electric and river valley projects are concerned, Madhya Pradesh has a record of a 90% violation of all mandatory conditions that govern these mega projects. An endless stream of violations of the Environment Protection Act and the Forest Conservation Act litter the corridors of the Ministry of Environment and Forests. Though these violations have been recorded by the ministry's regional offices, no action has been taken to punish the offenders.

In the same Shivpuri forest division, other violations resulting from the permission to mine inside the national park have added fuel to the fire and degrade both forest and wildlife in the area. I strongly objected to the permission given by the ministry to operate seven mines in 930 hectares of park area inside the Madhav National Park. Please note that in a clever usage of words, both state government and the Ministry of Environment and Forests refer to the land as the 'proposed extension area of Madhav National Park'. Someone in the corridors of power had ingeniously coined a new phrase to describe a national park. There is no such thing as a proposed extension area of a national park. When it is convenient the same government that notifies a national park

can end up calling the park 'a proposed extension area.'

**M**y objection to the mining was based on a letter dated December 1995 from the ministry:

'Sub: (i) Renewal of mining lease over an area of 930,734 ha. of forest land in district Shivpuri. (ii) Permission for removal of existing material and completion of mining operations in the forest areas already broken up in respect of 7 mines within the *proposed extension area of Madhav National Park*.

Sir, I am directed to refer to the Chief Minister, Madhya Pradesh D.O. letter No.4337/CMS/95 dated 1.11.95 addressed to the Minister (Environment and Forests) regarding above mentioned subject and to say that as a very special case this Ministry has decided to grant permission up to 31st March, 1996 only for removal of existing material and completion of mining operations in already broken up area in respect of 7 mines located in the proposed extension area of Madhav National Park subject to the condition that the state government will relocate the mines outside the national park in the alternate areas within the period of this temporary permission.

It is requested that during the period of temporary permission, the concerned officials may be directed to keep a strict vigil so that no fresh forest area is broken up during this period. It will be pertinent to mention here that regional office, Bhopal vide letter addressed to Chief Conservator of Forests (Land Management and F.C.), government of Madhya Pradesh has pointed out that mining activities were being continued in some fresh forest areas which were not broken up earlier. This should not have been allowed to re-occur.

It is also clarified that no further extension of temporary working permission from the state government will be entertained in future.'

Under no law in this country could the above clearance be given. It was obvious that there was a strong connection between the leasees of the mines and powerful politicians. And believe it or not, the 'special permissions' continued. This is indicated by a letter dated 14 May 1996, 'As a very special case this Ministry has decided to grant permission up to 30th June 1996....' Only in 1997 did the mining stop after the area was totally devastated. How could the central government issue such orders and under which law?

**T**o my objection, the inspector general forests in the ministry replied:

'The decision to grant temporary working permission up to June, 1996 in respect of 7 mines located in proposed extension area of Madhav National Park has been taken after careful examination of all the issues including hardships to local labourers engaged in the mines. It will be pertinent to mention that this permission is only for removal of existing material and completion of mining operations over already broken up forest area and more importantly, subject to the condition of relocation of these mines outside the national park within this period, so that the interest of the wildlife and labourers employed in these quarries can be safeguarded simultaneously.'

I could not believe it and in a letter to the IG Forests it was clarified that the area was reserved forest, national park land and it was illegal for the ministry to allow mining or removal of materials irrespective of the feelings of the labourers. Also, if the feelings of the labourers working in illegal mines were so important to the Ministry of Environment and Forests, they should have found alternative employment schemes for them. I never got another reply.

Similar examples of mining have taken their toll on Madhya Pradesh's forests. There are endless violations of a serious nature in Panna Tiger Reserve, the entire Bastar belt and in pockets across the length and breadth of the state. The Forest Conservation Act and the Wildlife Protection Act are totally abused. I even discovered the case of a missing sanctuary in the list of Madhya Pradesh's protected areas: Panna Sanctuary at the edge of Panna Tiger Reserve where endless mining encroachments have occurred. For some reason it was left out of the list and only recently has it reappeared. Such is the priority given to a sanctuary by the state government.

**I**n other cases, land from protected areas was being palmed off for irrigation projects which were totally in violation of the law. 40 hectares of land were given from Pachmarhi Sanctuary and a similar amount from Noradehi Sanctuary. I asked under which law was land from protected areas being given to irrigation projects. I knew that under the Wildlife Protection Act the only way this was possible was by denotification through a majority vote in the state legislative assembly. The reply:

'As regards the Amadehi Tank Project in Pachmarhi forests, the Chief Wildlife Warden, Madhya Pradesh has given a categorical certificate that the proposed transfer of land would not affect the wildlife of Pachmarhi Sanctuary and accordingly the proposal was approved vide this Ministry's letter dated 17.7.92.'

Now the letter dated 13.8.96 of CWLW, M.P. objecting the release of land 4 years after the land has already been released, was sent to the Government of M.P. for their comments. You are also apprised of the situation in the matter earlier.

The CWLW has certified that the area proposed does not form habitat of any migrating fauna or breeding ground and has recommended the proposal. Area approved in the case is 30.76 ha forest land which as per the CWLW, M.P. falls outside the boundary of Neradehi Wildlife Sanctuary.

**H**ow many cases exist where land from protected areas is handed away without any legal basis? It is a nightmare of violations that pile up in the files while our forests vanish each year. Political will to protect wildlife was absent, and when the central government did not accept the 'proposed diversion' the M.P. legislative assembly denotified the area. 160 hectares of Ghatigaon Great India Bustard Sanctuary were denotified by the legislative assembly for a railway line in 1993. Today this area has few signs of any wildlife. So much for the tiger state.

Madhya Pradesh leads in the race between the states for destroying their own natural heritage. This state earns a revenue off \$160 million from its forests, be it through commercial timber operations or from exploitation of minor forest produce. However, not even a minuscule half a million dollars goes back into the protection of the natural treasury. This is why the forest vanishes. Let us look at some official statistics to see what happened in the 1990s to the forests of Madhya Pradesh, which are its chest of natural treasures.

It is clear from a Planning Commission report that out of the 135,000 sq kms of forest cover, 72,000 sq kms was degraded – a result of the lack of funds spent on protection. This was the highest level of degradation for any state in India. The Forest Survey of India's 1993-1995 report revealed a loss of dense forest cover to the tune of 12,500 sq kms in Madhya Pradesh

and this was 70% of the total loss in India! The same report revealed a shocking total loss of 4,000 sq kms of forest in the tiger state, the highest loss of forest for any state in India.

It is quite amazing how till the 1990s there was little decline in the forest cover and then everything started to go wrong. Till 1989, the Forest Survey of India revealed an increase of forest cover for Madhya Pradesh but in the 1990s started the first decrease of 389 sq kms in 1991, 232 sq kms in 1993 and then of course the shocking figures of 1995. In 1995, the forest area under illegal encroachment was 2,200 sq kms, the highest in India. In the 1990s a total of 1,600 sq kms of prime forest land was diverted. It was clear that the natural treasury of Central India was being plundered. What is the value of these forests? One small component of Madhya Pradesh's treasury is its growing timber stock that is 'marketable'. It is estimated at 700 million cubic metres. The value of each cubic metre is Rs 8000-10,000. The value of Madhya Pradesh's losses are mind boggling.

There are many ways to lose forest cover legally, but probably the

most ingenious one was exemplified by the *sal* borer episode which ravaged the only viable tiger corridor link between Kanha National Park and eastern Madhya Pradesh. The *sal* borer is an insect that lives and breeds in the *sal* trees. Some *sal* trees die when there is a profusion of this insect. For over a century, reports of this insect and its life cycle revealed that weather cycles are responsible for its profusion and the negative impact on the *sal* tree is contained by changes in the weather. But the Madhya Pradesh Forest Department, believing that it is the master of nature, declared an epidemic of *sal* borer in 1997. Meetings and conferences were held and the experts agreed that the only way to save the *sal* forests was to cut the infected trees so as to minimise the infection in the following years.

Thus began a massive operation involving tens of thousands of labourers and thousands of trucks in the most pristine tiger forests around Kanha National Park. Before anyone could object, 600,000 trees were cut down. I was asked to assess the situation from the wildlife point of view and when our sub-committee carried

**Diversion of Forest Area in Madhya Pradesh, 1980-1997**

out its field visit, we were shocked that scores of healthy sal trees had been cut down using the excuse of an insect. Depots of wood were brimming full and the largest economic exploitation of the sal forests was underway with an estimated 30 lakh trees ready for the axe. It would have been one of the biggest timber operations in independent India.

**F**ortunately, a quickly produced and a sharply critical report on this entire operation resulted in an intervening application in a Supreme Court case which ordered an end to the cutting of any live sal tree. We had lost 600,000 trees but hopefully saved some. It was amazing to see an entire system crawl into the life cycle of an insect, not to deal with the disease, but to work out the commercial exploitation of the forest. On the 50th anniversary of India's independence and on the 25th anniversary of Project Tiger, the tiger state was showing its true colours in what I consider as one of the most shocking episodes of tree felling.

If we journey across Madhya Pradesh and look at some of the premier national parks, the state of affairs is shocking. Kanha Tiger Reserve is the jewel in Project Tiger's crown. In the last few years, its tigers have lost 600,000 trees in their home and in those vital corridors that connect them to the east. The management problems of Pench Tiger Reserve are compounded because of the 305 people that fish there. Checking identities, making ID cards, controlling movement in the core area is a nightmare for park managers. As speed boats on the Maharashtra side enforce the ban on fishing, the Madhya Pradesh park officials watch helplessly as scores of fishing boats pile up their catch on their side of the reservoir.

The periphery of Panna Tiger Reserve are a miner's delight and

whether for emeralds or white sand stone, the pressures steadily mount as encroachment and violation increase. The area around Bāndhavgarh Tiger Reserve gets more degraded each year. Even here, power projects like the Sanjay Gandhi thermal power plant position themselves on the tiger's habitat, causing further fragmentation.

Madhya Pradesh has not been left untouched by armed political insurgency. In some vital tiger areas like Balaghat near Kanha and in large sections of Bastar, vast tracts of forest are out of control of the Forest Department. In the Indrawati Tiger Reserve in the Bastar region, forest staff rarely enters the tiger reserve and people are generally advised not to go to the area because of a breakdown of law and order. Poaching is rampant in this region. And it's not just the five tiger reserves where problems magnify, but also in critical sanctuary areas like Pachmarhi, Bori, Sitanadi, Achanakmar, Noradehi and so on, where agricultural encroachments eat at the edge of the area. Also, fancy plans to expand towns like Pachmarhi are drawn up, even though it is in

the heart of some of the finest tiger country.

You can still see wildlife and tigers in Madhya Pradesh. The question to ask is, 'For how long?'

There are a few men in the forest service who serve the natural treasury first, and they can be counted on one's fingers tips. Their courage is commendable, but at the end of it all they suffer punishment postings and isolation, their bosses write negatively about them in the confidential reports which affect their promotions. They soon lose hope and commitment. One such person worked closely with me in the preparation of a report, but after its submission the pressures mounted on him to such an extent that he was forced to write a note of disagreement. And this on a report he fully agreed with.

Another officer was relegated to oblivion because he fought for the rights of wildlife against the illegalities perpetuated by the system. Most men serve their bosses or political masters first and the tragedy is that the Indian Forest Service is losing its teeth as more and more forest land vanishes, on the whims of the

Diversion of Forest Area in Madhya Pradesh, 1980-1997

leadership of this country. Few fight back.

In Madhya Pradesh, senior forest officers often have huge egos. After all, forest revenues of over Rs 600 crore run the government. The World Bank's integrated forestry projects made symbolic allocations for wildlife, but even there the four jeeps that were meant for field officers in protected areas were retained by senior officers in the state capital. It is difficult to calculate the resultant damage to wildlife and when junior officers question such decisions, they are warned to keep silent. The forest service appears to have forgotten who it serves first. They keep busy massaging each other's egos and keeping up with the fashions of the times, forgetting that the treasures that must be protected are not in the state capital but in the field.

Let us not forget that the declaration of Pench Tiger Reserve did not make it a 'model', but set it on the path to destruction. Because Pench was a part of the minister's constituency, it enjoyed a favoured status – it was one of the seven areas chosen for eco-development in a World Bank sponsored scheme. But the Rs 30 crore it will get will do nothing – probably accelerate the process of destruction because few care one way or the other. The mechanisms to protect nature are totally crippled and for most no longer in fashion.

**M**adhya Pradesh received favoured status in the ministry while the minister was from the state – the giant share of the budget went to M.P. Suddenly, after the minister left, the chief wildlife warden complained to me that he was facing grave problems because of drastic reductions in the budget. I took the matter up with the boss of wildlife, the same man who had dealt with fishing. In his reply, he stated:

'So far as the Madhya Pradesh issue is concerned, it relates to central assistance under the National Parks and Sanctuary scheme and not to Project Tiger scheme. The fact is that although we had tentatively allocated a much higher amount for Madhya Pradesh, their proposals were found deficient in many details. By the time these were replied to by the chief wildlife warden, we had released the money to the other states, based on their demand and proposals. You will appreciate that funds are released on first-come-first-served basis, and we cannot indefinitely hold funds for some state which does not submit proper proposals and full details/clarifications in time. You have yourself also mentioned in many meetings that funds to be released in time where proposal are ready and OK.'

**W**hat was 'first-come-first-served basis?' Can you manage wildlife effectively if budgets rise and fall at the entry or exit of politicians? Since 1996, four ministers have come and gone. There are many examples of other states – the state of Rajasthan, the declared rhino state of Assam, the state of Bihar – all with a plate of problems that reads like a horror story. The World Bank integrated forestry projects are also rapidly replacing natural forests with exotic plantations, be it in Andhra Pradesh, Madhya Pradesh and elsewhere.

The natural treasury of this country is vanishing. Its value is a million times more than our national treasury, be it gold, foreign exchange reserves or anything else. We don't allow our banks to be robbed, so why do we allow our bank of nature to be plundered? Lopsided priorities, greedy lobbies and a complete lack of commitment to our natural treasures has resulted in them being relegated to oblivion.

# Restricting human activity

M.D. MADHUSUDAN

WEST of Chikmagalur in Karnataka, the table-land of the Deccan Plateau rises to meet the wrinkled folds of the Western Ghats. Nestled in these lofty folds is the Kudremukha National Park. In the higher elevations of the park, grassy knolls crown the wind-beaten ridges. *Shola* forests with their gnarled and stunted trees huddle around gullies and streams as they hurry into the wet, thickly forested valleys below. These tracts are more than pretty landscapes – they are among the most important watersheds in the region with the rivers Bhadra, Tunga, Nethravathi, Suvarna, and Sitanadi all arising here. They also support rich wildlife assemblages comprising species such as the lion-tailed macaque, the great pied hornbill, large predators such as the tiger, leopard and dhole, and their prey. However, over the last three decades, numerous changes have occurred in this region, threatening its future prospects.

East of the main Kudremukha ridge, two decades of iron mining has badly scarred hundreds of hectares of

this landscape. Earlier, huge stretches of forests were logged to build roads, construct a reservoir, and to establish the Malleshwara mining township. The Forest Department also contributed to the ruin by covering vast stretches of grassland with plantations of exotic eucalyptus, casurina, and acacia. Such devastation continues to this day, with the recent issue of governmental clearances for further ore-prospecting in the region. The region's wildlife then, has suffered vastly under the onslaught of the state's unbridled commercial interests.

West of the main ridge is Dakshina Kannada district. Here, forces far less dramatic, but perhaps just as pervasive, preside over the devastation of wildlife. Last year, I walked over 200 kilometres through forests that were more-or-less bereft of wildlife. On these walks, I would hear my experienced local escorts recount tales of the region's once teeming wildlife. It was mostly their own energetic hunting, they confessed,

that had caused much of the wildlife declines. Today, many more people inhabit this region. Hence, they reasoned, the number of guns had risen, more land had been brought under the plough, more cattle grazed in the forests, with harvest of forest biomass on monumental scales. Thus, even as they barely eked out a living, the people here decimated wildlife.

The Kudremukha ridge then, as a metaphor, stands between two important forces—commerce and subsistence—that drive India's wildlife declines.

**H**istorically, the ascendancy of state-based commercial interests over local subsistence interests characterised the colonial policy of managing India's natural resources, principally its forests. Such a policy not only facilitated unrestrained commercial exploitation of areas under state control, but also necessarily intensified subsistence pressure on lands under local control.<sup>1</sup> Wildlife suffered in the resulting contest between state and local interests.

Post-independence, the Indian state placed a major emphasis on industrial development. A number of state-subsidised heavy industries, large irrigation and hydroelectric projects, road and railway expansions were initiated, often at great expense to wildlife habitats.<sup>2</sup> At this time, the country's population was in a tizzy, and food production assumed great importance. The grow more food campaign was launched. This encouraged extensive expansion of subsistence agriculture into forests and pastures. Loss of pasturelands aggravated livestock grazing pressures on forests. Under degrading range conditions then, there were outbreaks of livestock epidemics, which triggered die-offs in wild ungulates like the gaur and chital. Crop protection guns were

also sanctioned liberally under the campaign. Together with the availability of flashlights and jeeps, erosion of traditional restraints, and the rejection of hunting controls as a repressive colonial legacy, the wildlife of India was diligently being wiped out.<sup>3</sup>

With growing concern at these losses, an elite conservation movement coalesced within the country. It was able to mobilise political intervention for conservation at the highest levels of government. Under its preservationist impetus, the government designated several wildlife protected areas and passed the powerful Wildlife (Protection) Act to help stem wildlife declines. These efforts have indeed been successful in averting the otherwise imminent extinctions of species such as the tiger, Indian rhinoceros, and many others, and in checking the pace of decline among more widespread species.<sup>4</sup> The threats, however, remain and are being played out intensely as ever in our wildlife habitats.

**T**oday, the threats remain much the same as a hundred years ago. Well-organised developmental and commercial activity, and unorganised subsistence activity operate collaterally, often synergistically, in driving the decline of wildlife countrywide.

If developmental and commercial activities contribute prominently to wildlife declines via the usurpation and degradation of habitats, subsistence pressures often operate in less obvious fashions, but are equally competent in driving wildlife declines. Examples abound to illustrate this point. The India-Myanmar road being built through Arunachal Pradesh's Namdapha Tiger Reserve threatens to throw open this remote area to fresh human pressures.<sup>5</sup> Even as the road is being built, inveterate local hunting in the area pushes wildlife populations

down the tubes.<sup>6</sup> The Teirei Hydroelectric Project in Mizoram threatens to inundate large tracts of evergreen forests on the western fringe of Dampa Tiger Reserve.<sup>5</sup> However, subsistence *jhum* cultivation and hunting in the same area have already had disastrous consequences on this area's wildlife.<sup>7</sup> In Andhra's last tiger habitats—Nagarjunasagar, Nallamalai—heavy extraction of bamboo for paper mills poses the commercial threat,<sup>5</sup> while grazing by tens of thousands of cattle illustrates the scale of the subsistence threat. In Bharatpur, tourism is assuming industrial proportions and threatens the wetland wildlife just as do the pesticides leaching into the Ajan Bund from subsistence agricultural fields outside.<sup>5</sup>

**S**uch clear distinctions of commerce and subsistence are not always possible. Today, close linkages have emerged between many subsistence and commercial activities, blurring the contrast. Distant commercial interests commission and drive many, apparently subsistence, activities. In Masinagudi village of Tamil Nadu, thousands of cattle return every evening from the nearby Mudumalai Wildlife Sanctuary where they go in to graze. Dung collected overnight from their stalls is sent off in lorry-loads to fertilise gardens in faraway Coimbatore and Bangalore.<sup>8</sup> Around parts of Nagarahole, even the small local markets for wild meat tend to aggravate local hunting pressures on wildlife.<sup>4</sup> In the Great Himalayan National Park, local people collecting aromatic and medicinal plants for market contractors pit the alpine pastures of Gumtadav with their extensive digging.<sup>8</sup> In nearby Kiibber Wildlife Sanctuary, over the last decade, subsistence agro-pastoralist communities have increased their stocking rates of the yak three-fold in response to

demands from nearby markets.<sup>9</sup> Thus, nearly all local communities today act out threats authored by the relentless forces of global (and regional) markets over which they have no control.

These disconcerting accounts come from areas wherein wildlife enjoys express protection under law. Such protected areas, however, constitute only a niggling fraction of the nation's entire wildlife habitat. Outside these areas, protection to wildlife is virtually non-existent and the assault on them proceeds on a heroic scale.

**G**iven these facts, how can wildlife be conserved in India? At first appearance, simply eliminating all pressures from subsistence and commerce on wildlife should suffice. But, is this at all realistic? To answer this question is to juxtapose the ecological consequences of subsistence and commerce with their societal roles. Take any wildlife habitat. To the local user, its subsistence potential reigns paramount. Similarly, to the entrepreneur, its developmental potential, and to the conservationist, its intrinsic ecological potential. All are important, and none can be trifled with. However, here I proceed under the premise that our goal is to conserve wildlife. The question then is: in conserving wildlife, is it possible to also satisfy the goals of subsistence and commerce?

At this point, I believe that the term 'wildlife' needs a more rigorous definition – one that specifically includes species that are extremely sensitive and vulnerable to human pressures. First among them are large-bodied species of birds and mammals.<sup>10</sup> Their life-history traits such as occurrence at intrinsically low densities, large area requirements, slow rates of reproduction, and small litter sizes render them highly vulnerable to

all forms of human pressure. Many among these large-bodied species, such as large carnivores and elephants, invariably come into serious conflict – and lose – wherever their distribution overlaps human habitation.<sup>11</sup> Indeed, beyond the oft-cited example of the Bishnois of Rajasthan, there are virtually no examples of the peaceful coexistence of large, potentially dangerous wildlife with high-density human populations.

Next, there are specialists like the rhinoceros, lion-tailed macaque and the great pied hornbill, which are exclusively dependent on a narrow range of habitats and/or on select resources found within them.<sup>10</sup> They invariably flounder under regimes of intense human use. Indeed, a comparison of their abundances in areas facing human use, and those that do not, are apt to show major differences. Finally, there are endemics – species with highly restricted geographical distributions such as the Nilgiri tahr and grizzled giant squirrel.<sup>10</sup> Often, their restricted distributions are a consequence of their specialised needs, and losses in any one of their ranges means a compromise on the survival of an entire species. All wildlife, thus, are not equal.

**U**nder such a stricter definition of wildlife, the interests of conservation and the interests of subsistence and commerce clearly begin to diverge. In a context of high human density and fragile wildlife species, to realise either the subsistence or the commercial potential of wildlife habitats fully, necessarily implies forfeiting the goal of their conservation. This is not to suggest that, as a rule, wildlife is impossible to conserve where human subsistence goals are allowed to be met. Wildlife conservation is indeed possible in such regimes under two caveats – one, that population densi-

ties of local communities are exceedingly low and use is low intensity, and two, that we employ a definition of wildlife that is more pliant by including common, widespread and ecologically robust species. However, if we are indeed serious about conserving our fragile wildlife species, we must concede that it is near-impossible within landscapes catering to subsistence or developmental needs of our high-density human populations. These species need inviolate areas.

**U**nder a preservationist thrust, India's conservation programme has clearly recognised the need for inviolate areas. Through the last three decades, a network of wildlife reserves has been established wherein regimented forest departments employ legally sanctioned force to restrict or prohibit extractive human use. While these reserves have largely been successful in averting extinctions and stemming wildlife declines, they now face a wave of bitter conflict with local users. Today, these conflicts severely undermine India's effort to conserve its fragile wildlife.<sup>12</sup>

From their very inception, most wildlife reserves in India have contained resident human communities that have traditionally extracted resources from within. In order to render these areas inviolate, the state either coerced them to move out, or commonly used force to curb access to resources within the reserves. These measures, although very effective in the short term, amounted to mere subjection rather than a durable solution. At the same time, the local communities were expected to bear the costs of losses to crops, livestock, or life in conflicts with wildlife.<sup>12</sup> Genuine human concern for these communities was scant. In time, local anger and frustration generated by these measures have found voice in appropriate

political movements that now threaten conservation.

Given, on the one hand, the rigid conservation needs of certain wildlife, and on the other, a bitter experience with enforcing inviolate areas, what is the direction conservation in India needs to take? To ask that an area be maintained inviolate is not to reject human subsistence needs. It is true that under historical design and neglect, and in today's reigning pre-occupation with commerce, most subsistence lifestyles have suffered. Even to consider that underfed, ill-housed, illiterate peoples – often by the sheer force of numbers and need – visit much damage upon the vestiges of our wildlife habitats, generates a deep crisis of conscience. But, I believe, the answer is not to turn the clock back, and attempt a cleansing of history under naive notions that subsistence activity is no threat to wildlife, or recognise it – if at all – as completely remissible.

**T**o me, it does not appear that we are past all possibilities to maintain more areas as inviolate. A poor implementation of inviolate areas earlier does not attest that they are forever unworkable. Relocations of human communities are bound to be both painful and unsuccessful if they are executed – as they were earlier – merely as schemes to purge wildlife habitats of people. However, in many places today, local communities themselves desire access to basic amenities like housing, health-care and education, and are prepared to move to the peripheries of wildlife reserves to obtain them. It is absurd to reject such opportunities.

With such communities, well-planned participatory relocations are feasible provided these efforts demonstrate genuine congruence with the goals of social development of these communities, once they move out. Prompt and fair compensation must

be made for animal depredations. Only when there is a firm link between the concern for wildlife and the neutralisation of the opportunity costs to local communities will inviolate areas become an enduring reality. Where opportunities exist, serious consideration must be paid to local sharing of the non-use benefits (revenue from low-intensity tourism currently seems the only one) of keeping areas inviolate.

This does not detract from the fact that it remains absolutely essential that social disincentives must accompany all economic incentives to keep wildlife habitats inviolate. To administer these social disincentives (penalties, imprisonment, and so on), a regulatory authority at some level of government is essential – if state administered coercion is unacceptable, coercion administered locally is fine too. Finally, double standards must go. Inviolates must be out-of-bounds for commercial exploitation as much as they will be for subsistence uses. Conceived thus, inviolate areas for wildlife will, of necessity, form components of a larger landscape matrix dedicated to meeting human needs – subsistence use as well as commercial production.

**A**longside these efforts to forge long term alliances with local communities and generate greater local support for conservation, we need to address the realities of the hour. Our inescapable responsibility right now is to ensure that the wildlife there survives long enough to be conserved under strategies that are humane, just and democratic. And that means the continuation of preservationist measures to prevent poaching and the heedless biomass pressures on wildlife habitats. These must not be regarded as intrigues against human communities, but as reflections of the

enormous constraints we must work under in conserving fragile wildlife.

**O**ne does wish that there were easier ways of conserving wildlife in the human-dominated Indian landscape. But, there aren't. If we are serious about it though, it is time we got real and made some tough decisions.

# Nature at stake

AMITA BAVISKAR

FOR an environmental sociologist, the conflict over wildlife conservation is a particularly absorbing subject of study. While most other conflicts over nature are fairly easy to fit into a standard sociological matrix of class, caste, gender and nation, wildlife conservation presents a peculiarly intractable problem. If one were to study conflict around a river, for instance, the multiple users of the resource could be categorised in class terms for a perfectly adequate explanation of the political economy of water. In the case of wildlife conservation however, though the framework of class analysis tells us a great deal about the interests and ideologies at work in the confrontation, class is not enough. It is not enough to accept, as we do for forests, that the state represents the interests of industry and affluent consumers and that poor villagers who use

the resource for subsistence are its best stewards. The assumption, which is an article of faith for many of us, that ecology and equity go hand in hand, stands shaken when applied to wildlife conservation.

Wildlife conservation poses a challenge for the discipline of environmental sociology which is both analytical and political. To speak of the aesthetic values of nature or of the rights of other species to survive may well be bourgeois sentimentality. To stress the importance of preserving biodiversity for future generations on the planet may be scientific conceit. Yet, the case for conservation is not easily dismissed. There does seem to be an elusive, yet perceptible, value to nature that leaps across the cleavages of class.

To speak of such a value lays one open to the charge of being as bourgeois a sociologist as the binocular-

toting wildlifer. This is a risk we run when we acknowledge that conservation is not simply a conspiracy to swindle the poor forest-dweller of resources. Or when we accept that the practices of the poor today are not necessarily the most ecologically sustainable in all cases. Or when we admit that, however iniquitous, state policing has in some instances preserved pockets of wilderness that would otherwise have been swallowed up by the ever-encroaching tide of what scientists tactfully call 'biotic pressures'.

But the problems are immense. While a consensus around conservation is both desirable and possible, this happy outcome is certainly not in sight today. India's protected areas – national parks and wildlife sanctuaries – are the creation of a state which rides roughshod over the priorities of the people who live in and around these areas. What to conserve and how is decided by committees of experts – bureaucrats and scientists – who are not accountable to the ordinary people whose lives they so decisively affect. Access to these committees is privileged and small wonder that it is the affluent urban nature-lovers of the World Wide Fund for Nature (WWF) or the Bombay Natural History Society who have the ear of an Indira Gandhi.

**T**o attempt to conserve by unilateral fiat is to beg for trouble. Villagers in the vicinity of protected areas suddenly find that their rights to forest produce are stopped or severely curtailed and they have nowhere else to go. Since their loss is rarely compensated, they continue to use the forest, only to be branded as criminals for violating the Wildlife Protection Act. To suffer the ignominy of being booked for a forest offence, humiliation at the hands of a forest guard, the confiscation of forest produce, livestock or implements, is a daily burden

that forest-dwellers bear. Conservation finds no support around the protected area. On the other hand, instances of arson and theft are frequent reminders of the resentment that villagers feel. Nor are local people likely to protest when the protected area is degraded by the timber mafia or mining companies or poachers. In fact, these activities usually happen with local complicity.

**I**n such a fraught relationship, ecodevelopment pops up as a panacea. The strategy is simple: invest in creating alternative sources of livelihood around the protected area so that people stop going into the forest. Give people an incentive which weans them away from their customary practices and they will surrender their rights without a murmur. No longer will the settlement of rights be such an obstacle in the process of notifying a park or sanctuary. Ecodevelopment appears to be a win-win solution.

One of the main votaries of ecodevelopment in India is the World Bank. Having burnt its fingers with projects requiring the forced displacement of large populations, the Bank seeks to experiment with softer options, in this case that of the 'voluntary resettlement' of rights. The first phase of ecodevelopment in India was funded by an IDA loan from the Bank. Two national parks – Great Himalayan National Park in Himachal Pradesh and Kalakkad Mundanthurai in the southern Nilgiris were the first to be chosen for ecodevelopment. Subsequently, the Bank funded ecodevelopment in seven other parks and sanctuaries including Ranthambhor in Rajasthan, Gir in Gujarat, Rajaji in U.P. and Melghat in Maharashtra through the Global Environment Facility. In many ways, the case of the Great Himalayan National Park (GHNP) highlights the hazards that ecodevelopment fails to navigate.

The Great Himalayan National Park covers an area of 765 sq km in Kulu district, Himachal Pradesh. Most of the park consists of snow-clad mountain ridges more than 5500 m tall, divided by the gorges cleft by streams that ultimately join the Beas river, and the separate watershed of the Parbati valley. The streams flow through moist temperate forests of oak and conifers which, in the upper reaches, make way for high-altitude forests of birch and fir interspersed with sub-alpine pastures, which in turn yield to alpine meadows, scrub and snow-capped peaks. The vegetational diversity of the park sustains an equally rich fauna, including several endangered species such as musk deer, brown bear, Himalayan tahr, blue sheep, serow, western tragopan, and the chir and monal pheasants.

**E**very spring, as the snow starts to melt in the mountains, the high altitude pastures come out of hibernation. When the weather warms, thawing ice moistens the soil and allows the first shallow-rooted herbs to sprout. As spring lapses into summer, the pastures change colour as one group of herbs, grasses and sedges flowers, sets seed and dies, to be replaced by another group. The wild herbivores of the area are not the only beings to keenly monitor this succession; for the human inhabitants of the adjoining villages, the seasonal vegetation includes as many as fifty species of medicinal use which have become commercially important in recent years. The pastures in the park provide the pharmaceutical and cosmetic industries with herbs such as *dhoop* (*Jurinea macrocephala*), *kadu* (*Picrorhiza kurroa*), *patees* (*Aconitum heterophyllum*), *hathpanja* (*Orchis latifolia*) and *nhaini* (*Valeriana hardwickii*). From the shaded understorey of the forest, villagers also col-

lect morel mushrooms (*Morchella esculenta*) which are ultimately exported to Europe.

The pastures provide excellent forage for around 23,000 sheep and goats. In an intricately ordered system of grazing runs, villages around the park, and several of those further afield in Ani *tehsil*, despatch their livestock in herds of 500 to a 1000, supervised by three or four shepherds and their dogs, into the park. From May to October, the animals graze in the alpine pastures and gain the flesh that will see them through the winter.

**W**hile grazing is an ancient activity with a recorded history of over a century and a half, the park itself is of recent creation. From 1980 onwards, the birds and large mammals in the reserved forests of the region were sporadically surveyed by Gaston and Garson (a Canadian and British biologist, respectively), key actors in the Himachal Wildlife Project, an enterprise of international environmental NGOs and the Himachal government. Largely on their recommendation, the initial notification for the GHNP was issued in 1984 and a ten-year management plan was prepared in 1987. Local people figured in the plan only as degraders of prime wildlife habitats who would have to be provided alternative employment in return for making them give up their traditional resource use. The plan does not appear to have consulted villagers, except through informal conversations with the porters accompanying the biologists and with shepherds met along the way.

Since the initial notification, there has been a long gap in the implementation of the management plan. So far, the only significant achievement of the park authorities has been to check the customary practices of hunting and trapping. However, getting people to stop collecting medi-

cinal plants and grazing livestock, as required for any national park by the Wildlife Protection Act, has been impossible. Villagers' rights are recorded in minute detail in the Forest Settlement Report of 1886 which has never been revised. Villagers' confidence about their rights to resources inside the park is in large measure derived from this document.

The report is part of folklore; illiterate village elders, who could never have had access to the volume, let alone read it, when questioned about their rights will say that on such and such a page of the book the names of their ancestors are recorded and that is how they, the descendants, come to have rights. Of course, the rights accorded in 1886 now operate in a vastly changed context where human and livestock populations, land use practices, lifestyles and links with the outside economy bear little resemblance to what prevailed more than a century ago.

**Y**et curtailing villagers' access to the park, as the law demands, is a nettle that the park authorities have been reluctant to grasp. Himachali villagers think nothing of calling up their MLA who then calls up the park director to tick him off for harassing his people. Confident of their rights and their political support, villagers around the park casually flout the law. While the problem of the settlement of rights bedevils every protected area, it is unusual to find a case such as the GHNP where the Forest Department is on the defensive.

And so ecodevelopment. Get the people out of the park by laying a trail of carrots. And ecodevelopment has carrots galore for everyone. The Forest Department got Rs 7 crore from the Bank to be disbursed between 1994-1999, repayable at four per cent interest. Besides village-level

investment, the funds were to be spent on improving park management (training, equipment, infrastructure) and research (being conducted by the Wildlife Institute of India). Rumours of vast sums of money had started floating around the GHNP even before the project started. Accompanied as they were by darker rumours that their rights would be abrogated, villagers opposed ecodevelopment from the onset. One of the conditions stipulated by the Bank, that the park authorities get enforceable undertakings from villagers that they would forego their rights to resources inside the park in return for ecodevelopment, proved impossible to meet. Ecodevelopment was off to a rocky start.

Much of the controversy about ecodevelopment in the GHNP could have been avoided by identifying the problem more clearly. The Forest Department began by assuming that human resource use inside the park is the main problem besetting wildlife conservation. The scientific basis of this far-reaching assumption was rather sketchy since there was no baseline survey of biodiversity in the park, let alone any long term monitoring of ecological changes. Without exact evidence about which specific practices adversely affected wildlife, the park authorities launched off on ecodevelopment.

**R**ecent research by the Wildlife Institute of India points towards a complex situation. As far as the pressure of livestock is concerned, grazing is an activity of ancient vintage which seems, over time, to have been accommodated and even integrated into ecological processes in the park. The extent of grazing has not increased over the years either. Studies from other regions in the Himalaya show that a forest clearing created by grazing may actually increase flo-

ral diversity. And the manure left behind by visiting herds is a valuable fertilizer for the pastures.

Villagers around the GHNP also point out that their practices are carefully co-ordinated to spread the pressure of grazing evenly across different pastures. The grazing runs are timed in such a manner that the movement from pasture to pasture coincides with optimal fodder availability. In each pasture, villagers take care to bed their animals down for the night in certain spots such that 'weeds' like rumex do not proliferate. So grazing does not seem to be a major threat to the wildlife in the park.

**T**he threat to biodiversity by plant collectors is more substantial. In 1997, most of the major medicinal plants collected in the north-west Himalaya were included by the IUCN (International Union for the Conservation of Nature) in its Red Data Book. Several of the species collected from the GHNP figure on this list as critically endangered and threatened. While protecting these plants is important, banning extraction (as must happen under the Wildlife Protection Act) is an extreme solution.

The harvesting of medicinal plants should be regulated by the collectors themselves by devising rules about rotation of collection sites and enforcing a calendar which ensures that the plants can set seed before they are collected. Local panchayats which charge a royalty on medicinal plants could well be the best agencies for managing such a system with the backing of the Forest Department. Given the complexity of human impacts on the park, and the importance of these activities for local subsistence, there needs to be a carefully considered evaluation of resource use practices. Instead, park authorities tend to make unwarranted assumptions leading to a blanket ban.

An ecodevelopment project which begins by assuming that villagers are the problem is both scientifically dubious and socially unjust. The only response that it evokes from villagers is overt and covert resistance. That such an ill-fated beginning should be made at all is due to the structure of domination within which the World Bank and the Forest Department operate, in which villagers have no place in defining the problem or its solutions. Forever damned as criminals by the Wildlife Protection Act, the ideology of ecodevelopment offers salvation, but on terms set by the park authorities.

Villagers feature in ecodevelopment only as objects of social engineering, their practices to be remade in the image desired by the Bank and the Forest Department. Local protest should nudge these institutions towards negotiating solutions with the involvement of all the parties. Yet the straitjacket of law and the blinkers of power confine the possibilities for creative, participatory management of resources. Since local resistance is fairly strong in the area around the GHNP, the project is completely sidelined and a free-for-all reigns. This, of course, reinforces the Forest Department's belief that people degrade resources in the park.

**I**f ecodevelopment were to be made more participatory, would it be the best strategy for managing India's protected areas? Perhaps, but the experience of the GHNP suggests otherwise. Ecodevelopment targets the practices of the community living on the periphery of the park for transformation. Its avowed aim is to make local practices 'ecologically sustainable'. Meanwhile, every other trend in the area, each state intervention for rural development, is moving in the

opposite direction towards greater resource extraction.

Local farmers have shifted to synthetic fertiliser and pesticide intensive horticulture. Most young people seek the urban middle class lifestyles that government jobs promise. The first demand voiced by all villagers is for roads which will, among other things, allow their produce to fetch higher prices in distant urban markets. Increased links with the rest of the world have changed what was once a largely self-sufficient economy based on animal husbandry and subsistence farming. The rural community has become more differentiated. And the horizons of the upwardly mobile are no longer set by the high peaks of the GHNP but by the high-rises of *Dilli*.

**S**ince ecodevelopment resolutely ignores these changes, it cannot address the broader issue of sustainability within which 'local' practices are situated. The GHNP attracts 'ecological refugees'—impoverished Nepali migrant labourers who are hired by local traders to collect herbs. These migrants (who, despite their vulnerability, are left out of all the ecodevelopment plans because they are not 'local' and do not have rights) and the local villagers are today dependent on medicinal plant collection, for subsistence in some cases or for profit in others. A ban for the sake of 'ecological sustainability' will deny both these groups of income, even as the pharmaceutical industry sources its supply from elsewhere, where there is no ban.

As long as the question of sustainability is defined in a piecemeal way, localized to problematize the practices of only one set of villagers, ecodevelopment will not work. What incentive or precept do villagers have for prudence when they see profligacy

all around? The World Bank, a veteran of ecologically disastrous projects, certainly does not practice what it preaches. Nor do most votaries of conservation try for sustainability in their immediate environment. As the boundaries between Gadgil and Guha's notion of 'omnivores' and 'ecosystem people' begin to blur, the Bank and the state try to freeze one half of the frame. While for the rest of the world it is business as usual, those whose lives are most immediately connected with the park are expected to stick to an externally-set standard of sustainability. Is this realistic? Is it just?

Ecodevelopment may succeed as a stop-gap measure if it is able to offer people sufficient inducement on terms which are negotiated between all the stakeholders. But this truce will prevail only up to the point that alternative, more sustainable and remunerative, livelihoods are created and maintained. With aspirations spiralling ever upwards, eco-development will have to run faster and faster to stay in the same place. On the other hand, conservation in key centres of biodiversity stands a better chance of success if it is part of a consensus about natural resource use nationally.

Such a consensus will not foist conservation onto some villagers while enabling others to enjoy resource-intensive lifestyles. Such a consensus will spread the burden of resource use more evenly among different groups. Such a consensus cannot be mobilized by the Forest Department in its present form, but will be the outcome of a much more democratic polity. If the cause of conservation transcends social differences, it must find support in both civil society and the state. Creating this support is not a task that the World Bank can fulfil. What is needed is a collective endeavour by those most immediately dependent on nature and those who support their cause.

# Books

**FENCING THE FOREST: Conservation and Ecological Change in India's Central Provinces, 1860-1914** by Mahesh Rangarajan. Oxford University Press, New Delhi, 1996.

THE book under review constitutes an important contribution to a growing body of scholarship on the environmental history of South Asia. Through a detailed study of the erstwhile Central Provinces, the author explores the evolution of colonial forest and wildlife policies and practices, and the ecological and social changes wrought by them. The introduction contains a review of the existing literature and the major debates on the environmental history of the subcontinent, and presents the conceptual framework that guides the study. This framework successfully strikes a middle path between pre-colonial romantics and colonial apologists by pointing out that it is possible to acknowledge pre-colonial human-nature disequilibrium and yet demonstrate the qualitatively greater disruption caused by colonial policies. Rangarajan

adds another dimension to the discourse by hypothesizing that while material interests (in natural resources or revenues or in maintaining strategic control) clearly drove much of colonial policy, some of the more extreme measures and approaches adopted by the British (and some of the responses of Indian communities) can only be explained by understanding the cultural background and ethos of the rulers (and the ruled).

The first chapter is an overall review of state forest policy till the passing of the 1878 Forest Act. Rangarajan successfully substantiates the point about a qualitative difference between pre-colonial and colonial policies. Although 'there was no functional harmony [in pre-colonial times], fresh arable land was abundant, and state intrusion [into day-to-day resource use] was limited' (p.16). Indian rulers were 'content to take a share of the surplus. They did not attempt to outlaw or suppress any specific form of land use.' Thus, hunters, grazers, shifting cultivators, and peasants all co-existed.

The British, on the other hand, came with their own history that conditioned their attitudes – their experience with Irish rebels who took shelter in forests, their understanding of forests as the abode of lawless squatters and robbers, and their perception of forests as lands ‘that had lapsed into a state of nature because of inadequate care by man’ (p. 17). Thus, their initial antagonism towards uncultivated lands and mobile groups cannot be entirely explained in terms of their obvious material and strategic interests in controlling and exploiting forests. What one sees is the co-evolution of policy under the material demands for timber and the ideological bias against the jungle and the jungle-dwellers, culminating in the creation of the Imperial Forest Department and the highly intrusive Forest Act of 1878.

The next three chapters describe in great detail how this intrusive policy evolved and adapted to the specific ecological and social conditions prevailing in the erstwhile Central Provinces region (straddling today’s Madhya Pradesh, Maharashtra and Orissa) and what the social response and ecological consequences were, with each chapter exploring a specific issue: silviculture (ch.2), shifting cultivation (ch.3) and *shikaar*/wildlife management (ch.4). In the context of silviculture, Rangarajan points out that the conflict between the state and the local populace cannot really be cast in terms of ‘monoculture versus mixed forests’ or ‘cash crops versus subsistence species’, but rather as a direct conflict over access to forest lands and products. The chapter on shifting cultivation provides a detailed account of the British obsession with suppressing shifting cultivation – an obsession that went beyond concern with its impact on timber availability, possibly driven by the White Man’s burden of reforming the ‘savages’.

The description of the impact of British policies towards hunting and wildlife was for me the most fascinating part of the book, exploring as it does ‘a crucial but neglected sub-plot’ of the colonial drama. Rangarajan convincingly shows how British policies in this instance were driven primarily by non-material concerns, by notions of vermin, of sport, and of status, in ways that were generally at odds with the interests (and also more monolithic than the approaches of) the local communities. Britishers protected deer for sport, while cultivators looked upon deer as a menace to crops but also as a source of food. The single-minded extermination of carnivores (wolves, wild dogs, tigers) during this period reflects the prejudices of the British, not the concerns of the locals who, in fact, saw better the

ecologically balancing role played by the carnivores. The consequent decimation of the carnivore population on the one hand and the labelling of all forms of traditional hunting as ‘poaching’, ‘cruel’, and ‘wasteful’ is one of the bitter legacies of British rule that endures to this date.

The book is at times repetitious, lacks good maps and tables, and the writing style is not always smooth. The author’s dependence upon archival material limits the evidence and discussion on ecological change. Nevertheless, I would recommend it as required reading for all students of environmental history and also all those who still labour under the belief that the Imperial Forest Department was set up (as a good forester friend of mine put it!) to ‘protect people from their own improvidence’.

Sharachchandra Lele

**CROCODILE FEVER: Wildlife Adventures in  
New Guinea by Rom and Zai Whitaker: Orient  
Longman, Delhi, 1998.**

FOR well over a quarter century, herpetology in India has been associated in both the scientific and popular mind with the work of Rom Whitaker and his band of reptile addicts, mainly based in Chennai. The founding of the wildly popular Snake Park on the edge of the urban forest of Guindy was followed a few years later by the creation of a crocodile breeding and research centre off the road to Mahabalipuram.

Over the last two decades the Crocodile Bank, as it is called, has played a key role in helping rescue the three species of crocodilians from extinction in the sub-continent. Further, it has also set up the nucleus from which wild populations can be replenished. But the final act in the drama is on hold: the project to start a captive crocodile harvesting programme. India’s wildlife laws remain too rigid and officialdom too convinced that the only way to save nature is to try and lock all market forces out.

*Crocodile Fever* is the story of a similar venture, but it is one in which the harvesting and breeding of crocodiles did manage to accomplish its objective of controlled and regulated commercial harvesting. The story is set in Papua New Guinea, one of the most wildlife-rich islands on earth. It all began in 1978 when Rom Whitaker got a telegram from the Food and Agriculture Organization asking him to serve as an adviser and consultant for two years. Even after this sojourn, the Whitakers returned on shorter trips into the region to

survey and document the fate of crocodiles in the wild.

It is difficult for most of us brought up on tales about more charismatic animals like elephants and tigers to really like crocodiles. The great salt water crocodile, for instance, is both hunter and hunted. The book recounts how team members actually found irrefutable evidence, for the first time, of a 20-foot long 'saltie'. Across huge stretches of estuary and river, the salt water croc and its smaller fresh water cousin were vanishing as the skin trade provided incentives to catch and kill them. At the same time, there is little point in being unduly romantic when there is clear evidence that humans do get eaten by salt water crocodiles, though the stories about them are prone to be vastly exaggerated.

The Whitakers started with a simple premise: that the skins were by far the most valuable commodity that came out of the reptile's habitat. But the 'uncontrolled plundering of a resource' was doubly harmful as it wiped out populations in the span of a few years while exploiting the tribals as a source of cheap labour. Instead, they hoped to make captive rearing and breeding a viable industry. Drawing on their own experience of establishing saurians in captivity, they set about evolving basic guidelines for the task in Papua New Guinea.

But the census of crocodiles on the Sepik river turned out to be very different from the same kind of project undertaken in India. Here, they were dealing with a terrain that was very lightly peopled and with conditions that were much more forbidding. Eventually, they used a mix of techniques, counting crocodiles by flashlight at night when their eyes shine in the dark, and counting their nests by day, from a helicopter. The latter included brief landings to count the number of eggs, often a risky operation as mother crocodiles are capable of charging at intruders.

What makes the book a treat are the travelogues through areas and ecologies one rarely gets to learn much about. It is also heartening that Indian wildlife biologists are beginning to play a role in South East Asia. Nowhere has this such unpredictable consequences as when Whitaker and friends go 'snake-hunting', capturing live specimens to stage a snake show that was an instant hit. The highly poisonous two metre long taipan is described as 'nervous (and) frightened of humans'. The more colourfully named carpet python was trapped in the war dumps outside Port Moresby, where the huge populations of rodents sustained the snakes. The pictures in this book are not only an opener to the diversity of reptiles in Papua New

Guinea but also proof enough, if any was needed, that snakes can rival butterflies in their dazzling array of colours.

It was only in 1987 that Whitaker's team was allowed into Irian Jaya, a half a million square kilometre region populated by over 3,000 tribes. The account sensitively brings out the often tragic results of break-neck modernization in such areas. Japanese paper companies are logging the mangroves vital for the regeneration of fisheries. Laws are openly flouted. But the evidence points to how far-reaching the tentacles of the market can be: wiry Irianese hunters go out in boats hunting crocs with bow and arrow. One cannot but admire their courage, even as it is disturbing to learn how the skins they take end up in the world market.

The end notes tell us how crocodile farms are now flourishing in Papua New Guinea, and are run both by Chinese entrepreneurs and tribal cooperatives. One wishes the book told us more about how captive harvesting can be managed without becoming a conduit for illegal killing of crocs in the wild. It would also have been helpful had the authors appended a list of their scientific publications on the region's wildlife.

But the pictures are first rate, and the text makes for an easy read. Rom's passion for reptiles and Zai's literary flavour makes a fine combination. This book is a must and not only for reptile buffs. Wallabies and cuscuses, cassowaries and cockatoos, all add up to a heady mix. This is the zone where Asia and Australia meet, and this is a glimpse into that land of beyond.

**Mahesh Rangarajan**

**NATURE AND THE ORIENT: The Environmental History of South and Southeast Asia** edited by Richard H. Grove, Vinita Damodaran and Satpal Sangwan. Oxford University Press, Delhi, 1998.

A MAJOR shift in aesthetic valuation and preference has been underway over the past 100 years, more so especially since World War II. It is a shift of which we are all aware—the rise of environmental conservation, or 'green' consciousness. This consciousness has begun to exercise a substantial effect on world politics to the extent that in 1983 the World Bank was forced to include environmental cost assessment in all its projects. The early 1980s also saw the publication of the first reports by the Centre for Science and Environment in Delhi. The protracted and still unresolved controversies over the Narmada and Tehri dams have

brought environmental politics to the front pages of the Indian press.

The social sciences began to reflect this quickening interest, and historians were soon involved in the enterprise of environmental history. Archaeologists and ancient historians had, indeed, long been aware of these issues, and environmental degradation had been invoked to explain the decline of some civilizations. However, early environmental arguments were simply couched in terms of overpopulation and the reckless consumption of resources. The implicit message was that strong regulation by a scientifically informed state would solve such problems. The issue of the distribution of resources among different claimants was ignored.

Ramachandra Guha termed this 'environmentalism from above', characteristic particularly of colonial governments which thought of themselves as vastly superior to the peoples they ruled. Guha's *The Unquiet Woods* (OUP 1989) presented a pioneering critique of this approach and its assumptions. However, Guha tended to present colonial forestry as the instrument of capitalist effort to control and commercialize forest resources. A different perspective was offered by Richard Grove's *Green Imperialism* (OUP 1995). This book emphasized the intellectual roots of a sincere anxiety about environmental degradation on the part of at least some policy-makers in the British colonial world, and located it in a large body of empirical observation of the consequences of human interference in fragile environments. As Guha had noted, the question of how people treat their environment cannot be separated from how they perceive it; hence cultural anthropologists have also begun to address environmental concerns in their work. Meanwhile, Madhav Gadgil and Ramachandra Guha published *This Fissured Land* (OUP 1992), a bold survey of Indian environmental history from the earliest times to the present, incorporating much of Guha's research on colonial forestry, but also including Gadgil's bold hypothesis that the caste system evolved to meet the problem of scarcity of natural resources that was felt in the first millennium C.E.

The issues raised have excited a host of scholars, and the volume under review presents the work of no less than 31 of them. The period covered ranges from the global warming that ended the Ice Age about 10,000 years ago to the early 1990s. Given the enormous range of the areas and topics covered, this review is perhaps best organized by looking at a few themes of contemporary relevance.

*Pre-colonial impact of human activity:* Did 'traditional' societies—societies that existed before the

hegemony of industrial capitalism and colonialism—have no significant impact on the natural environment? The archaeologists would certainly disagree. Allchin points out that the Harappan cities made major demands on the local environment, and argues that the treelessness of the trans-Indus hills may be explained by the constant pressure of human and animal populations over thousands of years. Erdosy also finds evidence of human activity modifying local ecosystems, with periodic alteration of the forest cover and gradual denudation. However, 'irreversible ecological decline came only with the Industrial Revolution, even in the Ganga-Yamuna Doab.'

Nor were such impacts confined to our sub continent. An exciting study by Stargardt describes how the Satingpra civilization of the Malay peninsula fine-tuned its environment for rice-paddy and navigation, and Reid indicates two major periods of environmental change in South East Asia generally. The first of these began in the 8th century C.E., with the spread of terraced paddy cultivation; the second with the rapid spread of market-oriented agriculture from the 15th century, as sugar, cloves, coffee and so on occupied former forest land. At the same time, extensive international trade led to the depletion of woodland resources including sandalwood and wild elephants. The pattern of trade between hunter-gatherers of the forest upland and settled peasants of the valleys is sketched in Kathirithamby-Wells.

This is important because alongside the idea that 'traditional' societies had no impact on their environment is the myth that natural products did not enter long-distance trade. These notions are contradicted not only by Reid but also by Boomgardt for 17th century Indonesia and Tucker in his work on the western Himalayas at the outset of British rule. Of course, trade expanded in a major way with the Industrial Revolution. Early railways in India imported pine from Norway and ironwood from Australia, while drawing on regional resources for sleepers. Once built, they enabled far vaster movement of materials.

*Forestry, modern science and the state:* The colonial period in South Asia also saw the imposition of an unprecedented degree of state control over forest lands, and this generated a mass of official records on the issue. Not surprisingly, therefore, many papers explore aspects of this process, as well as the resistance to it in Madhya Pradesh, parts of Gujarat, Maharashtra and Karnataka as well as in princely states in the arid region of Rajasthan. This last is studied by Edward Haynes and his paper presents an integrated view

the management of cultivation, grazing, woodland and hunting preserves. The latter are, of course, of particular interest because several important national parks were originally such princely preserves.

The Forest Department's justification of its extensive powers was, and is, couched in terms of its superior scientific understanding, and this justification is assessed by several authors. Ravi Rajan argues that Indian scientific forestry was imported from Germany, and brought with it a contempt for local populations because of their ostensible scientific and technological backwardness. Subhash Chandran is strongly sceptical and believes that science was merely a cover for the hidden agenda of driving tribal people to work on the plantations; Patel denounces the modern neglect of the tribals' deep traditional knowledge of their environment. A larger point in this controversy is made by Grove, who suggests that western science often drew from infusions of indigenous knowledge and the work of colonial scientists, and so the separation of the two need not be overstressed.

Buchy, who studied the same region as Chandran, finds colonial forest policy not so much ecologically unsound as socially and economically disruptive. The role of political power in modifying scientific rigour is shown by Meyer's study of Sri Lanka where forest control was blocked by powerful planter interests, and so confined largely to persecuting Sinhala forest users. A paper by Greenough provides an interesting sidelight on scientific and factual discourse by skillfully unearthing rhetorical devices and tropes that structure those much consulted sources – Hunter's *Statistical Accounts of Bengal*.

*Communities, cultures, rights:* The colonial foresters saw population growth and the consequent demand for land as a prime cause of forest destruction. In this volume, Flint sees deforestation driven by agricultural expansion and aggravated by unsustainable extraction as 'a dominant trend in the history of Indian land-use.' Her paper cites data to show that in 1880 about 32 per cent of India's surface was under woodland of some sort, and an equal proportion under cultivation; by 1980 cultivation covered 44 per cent of area, and forest, including degraded woods, 20 per cent. This was not solely a result of demographic growth (the population trebled in that century); but also of over exploitation despite government controls designed to prevent it. However, she does note efforts at the sustainable management of *sal* forest in recent decades.

If state efforts are misguided and ineffective, as many contemporaries argue, how do local communi-

ties manage resources? The classic work on this is by Elinor Ostrom, *Governing the Commons* (CUP, 1990), which emphasizes community conventions and policing. In this volume, Subhash Chandran presents the sacred groves of South Kanara as an example of such collective self-restraint. Similarly, Zerner provides a richly textured study of how both spirit guardians and human watchmen were deployed by Indonesian villagers in the Maluku islands to prevent theft and over-exploitation of various resources. The need to invoke such a complex of sanctions is itself an indication of the attractiveness of cheating. Sources of modern disruption of such community restraints figure in Kathirithamby-Wells, who points to the forces of immigration and consumerism. Thus, the low-powered controls possible in small, isolated local communities may not be successful where truckers with chainsaws and AK-47s can sweep off the growth of decades in a matter of hours.

It will thus be evident that this book bears on a whole range of issues highly relevant to contemporary debates on the environment, and demonstrates the value of taking a long perspective on these burning contemporary problems.

Sumit Guha

**ECOLOGY, CLIMATE AND EMPIRE: The Indian Legacy in Global Environmental History, 1400-1940** by Richard H. Grove. Oxford University Press, Delhi, 1998.

Richard Grove's most recent book is shorter and more accessible than his earlier offering, *Green Imperialism* (1995). Some overlap of themes in the two is not necessarily bad, since the reader can now get at the crux of Grove's 1995 argument without wading through the detail that suffuses the earlier book. In addition, this new book takes the reader on a whirlwind, worldwide tour of conservation thinking and practice between the 17th and mid-20th centuries.

A number of themes run through the first four chapters of the book. Countering arguments put forth by Ramachandra Guha, Madhav Gadgil, Richard Tucker and others, Grove argues that far more than just an economic rationale motivated colonial conservation policies in India and elsewhere. Grove makes a compelling case that genuine environmental concern underlay the activism of the earliest conservationists, pushing the colonial government to adopt environmental regulations in India in the early 19th century.

He goes on to argue that systematic observations by these early conservationists, mainly medical surgeons, helped advance the scientific understanding of environmental consequences linked to deforestation. This scientific enquiry took place at the periphery, rather than within the colonial metropole, contrary to conventional positions on the advancement of science during the 18th and 19th centuries. Whether or not this was cutting edge science is questionable, and I will return to this shortly. In support of his notion of the peripheries as ignored loci of scientific research, Grove convincingly demonstrates that the work of Indian (Scottish, really, but Grove refers to them as Indian) and Australian scientists during the early 19th century played a key role in unearthing links between El Nino and world climate patterns. The accuracy of much of this research has in fact been substantiated over time.

Chapters five and six focus on local-state negotiation over access to forest resources, and Grove makes a number of points. First, restrictive conservation policies of the colonial government may not have been significant departures from restrictive policies imposed by pre-colonial states. Second, it is unclear that marginal communities suffered unduly under these policies; rather, conservation policies may have disturbed existing power relations that formerly denied particular communities access to natural resources. Third, indigenous resistance often forced the British to alter or withdraw particularly harsh restrictions. Grove's call for a re-examination of the nature of local-state negotiations over access to forest resources is well taken.

The argument that the rationale for colonial forest conservation derived primarily from environmental rather than economic concerns is persuasive up until the formation of the Indian Forest Department in the mid-19th century. The argument is less convincing following this institutionalization of conservation policy. The foresters staffing the Forest Department were trained to manage forests to ensure a sustainable supply of economically valuable timber. Correspondingly, the boundaries of reserved forests coincided with tracts of land that had the best stands of timber. Similarly, particular species of trees were reserved outside reserved forests – teak, deodar, pine, sal, and sandalwood. Vast expanses of mixed forest were converted to single-specie plantations – again of teak, deodar, pine and so on. Each of these policies points to the primarily economic interest of foresters in the Indian forests. Greater environmental concern would have been

reflected in a more catholic interest in forest stands and tree species, with prioritization of conservation based on the ecological fragility of an area rather than the purely economic worth of timber species.

Of course, the writings by many foresters suggest a deep concern with the consequences of deforestation. One needs, however, to examine these writings in the institutional context within which they were articulated. Following the formation of the Forest Department, and well into the 20th century, attempts by foresters to bring forest land under the 'scientific' management of the Forest Department were resisted by the Revenue Department, till then the sole government agency controlling access to forest areas. In countering such opposition, foresters routinely indicated that increased flooding, desertification and drought were inevitable consequences of a continuation of unscientific land use practices. Large scale clear felling by the Forest Department, however, suggests an inconsistency in their stated concern with, and their own involvement in, deforestation. Writings by foresters, Grove's primary evidence to support his contention of environmental concern driving environmental policy, need therefore to be seen in light of the power plays of the time, and the political mileage that foresters drew from an alarmist rhetoric.

In suggesting that the colonial periphery was at the cutting edge of scientific enquiry, Grove ignores the fact that many of the soil and water conservation capabilities attributed to forest cover during the 18th, 19th, and 20th centuries have been discredited in the ecological literature since the 1920s. The link between forests and rainfall is highly dubious; so too is the notion that forests play a critical role in preventing floods. In the absence of forests, other vegetation such as grass and shrubs may be equally effective guardians of soil and water resources. And yet, Grove routinely points to 'empirical observations' by colonial environmentalists of altered rainfall, declining stream flow, increased flooding, increasing desertification and so on, resulting from decreasing forest cover.<sup>1</sup> It is likely then that environmental theory was informing empirical observation, rather than the other way round.

Rhetoric rather than good science was almost certainly at the cutting edge of colonial environmentalism. That the rhetoric survives to this day is at least partially due to its political usefulness, particularly so

1. For a review of this literature, see Bosch and Hewitt (1982). A review of catchment experiments to determine the effect of vegetation changes on water yield and evapotranspiration. *Journal of Hydrology* 55: 3-23.

in the face of continued resistance to conservationist attempts to curb resource consumption within areas of conservation interest. Despite Grove's entertaining, marvellously written, and copiously documented work, I think he misses a key factor which has shaped the international conservation rhetoric.

Vasant K. Saberwal

**THE POLITICAL ECOLOGY OF FORESTRY  
IN BURMA, 1824-1994** by Raymond L. Bryant.  
Oxford University Press, Delhi, 1997.

Bryant's contribution to the growing corpus of literature on the history of state forestry is a well-intentioned effort to examine the operation of the system in Burma. For those focusing on the global aspects of forestry, there is further evidence here of the extension of the many experiments first tried in Burma to other parts of British India. Bryant's study is a narration of the various phases of the state-driven forestry programme in the region. The author admits that the source-base is inadequate since the records in Myanmar could not be accessed when the book was being written (the government of Myanmar has only recently opened its archives for non-nationals).

It would be more useful to address broader methodological and interpretative problems with the book rather than reviewing its substance in detail. Though we appreciate that Bryant's treatise was constrained by lack of local sources, the author should have been more critical in his reading of them. A historical study can no doubt be based on records available in London, itself a rich source of documents, but simple-minded generalisations without evaluating the biases of these sources can be problematic in a book with such a grandiose title.

A scholar who has appended the adjective 'political' to his study of ecological history needs to provide more sophisticated explanations for aspects of historical change. It prompts the discerning reader to the conclusion that perhaps conventional accounts of policy shifts within broader colonising processes are more convincing than the trendy research on much the same history redesignated as ecological studies. For example, the shift from what is *prima facie* accepted as a significant shift from private monopoly to *laissez-faire* may not have been such a drastic change. After all, Bryant shows that complete monopolistic control was not successful in the years before 1853. The following years saw a difference in form and guise in

official policies relating to forests which has been read by the author as a difference in substance. The end of monopoly control by the company was not a shift of its focus from commercial to benevolent activity, but a reorientation of policy to accommodate newly emergent lobbies and to fulfil its own purposes in a more efficient way. Any change in policy orientation is marked by a surfeit of rhetoric denigrating the workings of the earlier procedure and eulogising the new.

The political ecology framework seeks to inquire into the political sources, conditions and ramifications of environmental change. In this book, the term 'political ecology' fails to impress. Political ecology is obviously the study of a particular aspect within political economy. Political economy is a broad paradigm within which one can choose to emphasize a particular aspect, process or relationship. For instance, one can study labour conditions in a particular context. The resultant study does not benefit by being redesignated political labour. The term 'political ecology' is obviously of long standing, but frequent use does not make it any sounder or more substantive.

The use of the term is even less justified in Bryant's case, which is evidently a study of the institutional expansion and working of the forest department in Burma. Neither environmental change nor ecology in the latter's broadest definition figure as separate factors which are given special treatment. The rest of the book uses conventional categories and provides a narrative account of the history of forestry in Burma, an exercise that could well have been accommodated in a political-economic frame of reference. It is difficult to demonstrate, in any case, environmental changes brought about by political-economic changes. There is a lack of documentation, especially of the pre-colonial period. It is intriguing that a process that is quite amenable to description within existing rubrics should suddenly appear under a new guise.

This perhaps only emphasizes the point made earlier that the mode of analysis, by compulsion of adhering to the obvious principles of interpretation, shares fundamental premises with methods that have their origin in ideologies which practitioners of political ecology cannot countenance. It is perhaps the hope of such practitioners that *avoir du pois*, rather than rigour and consistency, will provide a sufficient and operative alternative to the political economy perspective. Elements within political economy relate to one another. The fact that forests (gender issues, law, symbols, representative systems and many others) have not been stressed within the framework so far does not

merit a new rubric. Bryant's proclivity to lean towards American sociology of the non-Marxist tradition is evident in the uncritical citation of the works of Michael Adas, James Scott, Nancy Lee Peluso, Theda Skocpol and Ramachandra Guha. The undue ease with which new conceptual frameworks evolve, which in no way depart significantly from older frameworks, is itself a subject worthy of sociological study.

Third, the account of the forest department in the introductory chapter is one of absolute control, authority and regulation. This seems to stand at odds with the importance assigned in subsequent discussion to resistance. Perhaps it is the case that widespread resistance and authoritative state control can co-exist with relative ease. That resistance does not tantamount to any change in the objective situation in which the protesters find themselves may be reason to appreciate the limits of such insubordination.

The ecology that Bryant tries to highlight appears more as an economic factor than a natural one. The author also fails to draw out the differences between the colonial and the post-colonial states, their nature, orientation and institutional frameworks. This presumably should be the premise on which forest politics crucially rests. In a discussion of the post-1966 policies, Bryant accepts at face value the 'state socialism' of General Ne Win and clubs it with the destruction of the environment by other state socialisms, including that of China.

To conclude, Bryant's study is not informed and serious about either ecology or politics. This book with its empirical strengths would have had great merit if only the empirical detail was located within a sustainable theoretical context. The claims made in the introductory pages rest on flimsy ground. The book, however, contains a wealth of source material for the more equipped.

Stella D'Costa

**THE LAST FRONTIER: People and Forests in Mizoram** by Daman Singh. Tata Energy Research Institute, New Delhi, 1996.

North East India, a region abounding in natural wealth as in cultural diversity, is of great interest to environmentalists and social scientists. Few studies have analysed the needs of the rapidly changing indigenous societies in relation to environmental problems and conservation. People's lives, especially in the hill tracts, are inextricably linked to and dependent upon environmental and forest resources. Understanding

and addressing human needs is therefore an imperative part of designing conservation policies.

*The Last Frontier* breaks new ground in this respect. The focus is on Mizoram, the relatively obscure hill state wedged between Bangladesh and Myanmar. A variety of tribes, such as the Lushais, Paites, Hmars, Mara's, La's, Riangs and Chakmas, people Mizoram. Shifting cultivation or *jhum* in the verdant bamboo and evergreen forests that cover over 80 per cent of the land provides sustenance and occupation to most of the state's people. Mizoram offers an instructive study due to profound historical changes in people and landscapes. The analysis of people and forests in this book is organised in two parts. The first provides an environmental history of Mizoram, thematically exploring changes in belief systems, domains of resource access and use, social institutions governing the exploitation of natural resource, and technology. In the second, the author provides a survey of Mizoram's natural resources, shifting cultivation practices, village and state forest reserves and their management by the people and the state.

The conversion of over 80 per cent of the population from animism to Christianity and from illiteracy to literacy in less than a century (1894-1994) caused fundamental changes in peoples' relationship with their natural environment. This dislodged the superstition and mystique that ordained a central place for nature in human existence and allowed an indigenous rational thought and conception of nature to unfold.

Concurrent to changes in belief systems, political upheavals and reorganisation led to manifold changes in the domains of resource access and use, as well as the social institutions governing them. From a regime of village republics ruled by sovereign chiefs, the political status of Mizoram changed to statehood in 1987, after two decades (1966-1986) of insurgency and a brief period as a union territory. A significant change was the overthrow of the traditional system of chieftainship and its replacement by a democratic system of local self-government by elected village councils. The village council was vested with powers to regulate shifting cultivation or *jhum* and manage the special village safety and supply forest reserves created by state laws. State laws enacted in the 1950s brought about these changes. The author points out that the domains of resource use became increasingly restricted with time because of clear delimitations of political and village boundaries. For the common man, however, the domain actually increased due to the creation of village forest reserves and the implementation of a lot system for selection of *jhum* plots.

The book shatters many myths regarding jhum with compelling arguments based on reinterpretation of secondary data, coupled with primary data and 'general impressions borne out by field enquiry.' The primary data is from visits to six villages and questionnaires canvassed in 36 sample villages. With data from Meghalaya and Mizoram on jhum and recovery of abandoned fallows, the author presents a convincing argument that jhum can be sustainable at fallow cycles of five to ten years depending on site conditions. In addition, she uses historical, demographic, agricultural and local records to argue that there is no evidence to suggest that jhum cycles have declined due to population pressure or land scarcity in most areas.

The claim that jhum causes inordinate soil erosion is also abrogated by data from experiments carried out in Meghalaya by the Indian Council for Agricultural Research. These show that fields cultivated for a year and abandoned (the most common practice in Mizoram) have lower erosion rates than other forms of land use including modern agriculture and horticulture. This is ascribed to multiple cropping and rapid growth of bamboo that secures the soil.

One widespread notion of the destructive potential of jhum that the author finds support for is its impact on native biodiversity. Although the data given in the book is sketchy, this is a conclusion that has been borne out by other recent studies. The complexity and diversity of the rainforest ecosystems and their susceptibility to disturbances, implies a need for areas free from jhum to conserve the region's unique biodiversity.

The analysis of village safety and supply forest reserves is relevant to the present-day debate on community empowerment in the management of natural resources. The author points out that these reserves created by state laws are not 'traditional' as assumed by other authors. Their success is attributable to the control by the village council, which is sensitive to local needs, and factors such as isolation from markets and demographic pressures. Safety reserves, usually surrounding villages and kept free from extraction, were designed to protect the village from fires. As the threats of fires decrease with people moving into occupations other than jhumming and with increasing demand for land for building houses, these reserves are likely to suffer. There is an urgent need for a reappraisal and definition of the legal status and geographical extent of these reserves. Further, their utility as a model to follow and extend to other areas needs to be studied in greater detail. The role of these reserves in conserving

biodiversity, besides providing for people's needs, is also still an open question.

In the concluding section, Daman Singh presents an appraisal of the government's new land use policy (NLUP) begun in 1991. The NLUP aims to provide alternate occupations to every family in Mizoram that depends on jhum. Although laudable in its intentions, there are causes for concern in its implementation, as the village councils have been ignored and sidelined. In the process, regulation of jhum is in disarray at the village level in many NLUP blocks. It is too early to comment on the success of the scheme, but the need for critical monitoring of its implementation is obvious.

This book is an invaluable reference for people interested in shifting cultivation and environmental problems in North East India. It is written in a very readable style and has only a few minor typographical and factual errors. Its major drawbacks are in that the analysis has virtually ignored comparisons with shifting cultivation communities in other parts of the world and in states like Arunachal Pradesh, that it uses a variable and vague conceptualisation of the meaning of 'sustainability', and that it relies heavily on secondary data, often of variable quality.

**T.R. Shankar Raman**

**IN THE BELLY OF THE RIVER: Tribal Conflicts over Development in the Narmada Valley** by Amita Baviskar. Oxford University Press, Delhi, 1997.

*In the Belly of the River* addresses significant themes in the study of contemporary political agitations that have been termed 'environmental movements'. Of central concern is the question: do tribal subsistence activities, 'traditional' values and political consciousness constitute an inherently valid critique of the current model of development?

Baviskar deliberates on the proposition by exploring and documenting the resistance of the adivasi hill Bhilalas to their imminent displacement by the Sardar Sarovar Dam. The Bhilalas' defense of their lifestyle and resources from further marginalisation propelled them into an intense and direct confrontation with the larger political economy of 'development' in post-independence India. From a position of relative isolation and low equilibrium self-sufficiency, the Bhilalas are now compelled to strike broader social alliances and negotiate the terrain of contemporary politics. It is this context that Baviskar interrogates in

a micro-study which involved a prolonged period of field work as a researcher and partisan activist in the on-going agitation.

To Baviskar's credit, despite her obvious empathy for and association with the movement, the study is sustained by a critical distance from the complex of issues and events. The conclusion, in fact, bears this out by being strikingly blunt and objective. The adivasis (Bhilalas), the author contends, are not currently sustainable resource managers, nor is their relatively egalitarian social organisation bereft of internal tensions and contradictions. In sum, the notion of a homogenous tribal community sustaining both the forests and their culture with an ingrained 'environmental consciousness' is a caricature, propagated by a predominantly urban intelligentsia.

Baviskar arrives at this understanding by historicising the experience of the Bhilalas and by attempting to recover their agency. The argument, therefore, is concentrated on identifying overarching processes of economic and political exploitation that have, over periods of time, marginalised the Bhilalas and compelled them to adopt unsustainable practices in resource use. Resistance to such oppression has, moreover, been a defining feature of the adivasis' history and identity, and far predates the efforts of the Narmada Bachao Andolan and the Sangath—two organizations currently active in the submergence zone.

Baviskar, in effect, argues that the romanticizing of the adivasi world or the misrepresentation of their struggle as merely a part of an 'external critique of development', is fraught with the danger of limiting the transformative potential of the movement. Any decisive political perspective on the Bhilalas must therefore develop or have an estimate of both their strengths and their vulnerabilities.

However, like most studies that break fresh ground, *In the Belly of the River* has its share of limitations and omissions. The most glaring of which is, perhaps, Baviskar's presumption that reportage and claims can substitute for evidence. The assertion, for example, that the Narmada Bachao Andolan 'show cases' the tribals while underplaying the role of the landed patidars in the Narmada movement is not supported either by interviews of the Andolan leadership or a rigorous review of its literature and activities, in the absence of which the Andolan's strategy *vis-à-vis* the tribals remains unclear. Similarly, the claim that the Indian 'state' in the post-independence period has eroded the resource base (forests) of the Bhilalas of Jhabua district is unsubstantiated.

The book contains several perfunctory and thin discussions of complex and contentious issues which are thrown up in the introductory pages but never followed through. The section on ecological marxism, for example, barely covers a page and is inadequately defined as a critique of commodity fetishism. In the book's subsequent discussions neither is the methodology of ecological marxism evident nor is the concept's relevance to the whole study brought out. Last, for some inexplicable reason, Baviskar has chosen not to explain the salience of selecting the village Anjanvara for her case study. Surely it could not have been an arbitrary choice?

Despite these criticisms, the book raises several engaging and interesting questions which have been glossed over in most secondary accounts of the anti-dam movement. To add to this, Baviskar's elegant prose and fine-grained sense for detail, dotted with anecdotes, make for a captivating read and will appeal to a wide readership.

Rohan D'souza

#### **BUILDING BRIDGES FOR CONSERVATION:**

**Towards Joint Management of Protected Areas in India** edited by Ashish Kothari, Farhad Vania, Priya Das, K. Christopher and Suniti Jha. Indian Institute of Public Administration, Delhi, 1997.

THIS book is a useful compendium of issues related to joint protected area management. It comprises of nine major 'documents', but each document has several sub-documents attached. Four of these reports comprise of overviews of the situation in India and abroad, proposed changes in India's wildlife legislation, a proposal to expand the system of categories that covers protected areas, and a bibliography on conservation and people. The other three documents are detailed case studies of the Kailadevi Sanctuary in Rajasthan, Dalma Wildlife Sanctuary in Bihar, and the Rajaji National Park. As part of their 'action research', IIPA staff conducted various workshops to sensitise villagers and park officials on each other's views. The resulting reports and resolutions passed have been helpfully enclosed, along with other relevant material such as a summary of Justice Poti's Interim Report on Rajaji for the Indian People's Tribunal on Environment and Human Rights and the RLEK (a local NGO) plan for community management of Rajaji.

In view of the vast outpouring of material on joint forest management (which is technically confined to

degraded forest lands), it would have been helpful if the differences and similarities between JFM and JPAM had been systematically dealt with. Most of the problems highlighted in the first document are common to both – the absence of a historical understanding of the area, the villager's and lower forest staff's lack of access to available knowledge, the contentious status of such knowledge as is available, and the absence of basic data on social and ecological parameters. Indigenous knowledge is ignored, as are existing community structures of conservation.

The picture really begins to become clear in Document 7 which explains the existing nomenclature dealing with protected areas. The Wildlife Protection Act provides for national parks, which, in theory, are strictly off-limits to humans; sanctuaries, where certain types of rights are allowed; closed areas, where hunting is prohibited; and game reserves where hunting is allowed on license. The first two categories are, however, the most common: India has 80 national parks and 441 sanctuaries covering 4.5 % of its landmass. Thus we see that unlike in ordinary reserve forest areas, local users in and around protected areas are subject to more stringent legal restrictions. In addition, since the rationale for protected areas is conservation rather than serving local needs, the proponents of popular involvement have that much more convincing to do.

The three case studies by Priya Das, K. Christopher and Farhad Vania make interesting reading, both in themselves and as comparative material for each other. Each area has its own peculiar set of variables that must be dealt with in any proposed management plan. In Kailadevi, this includes mining inside the sanctuary and the pressure exerted by migratory Rabari herdsmen. In Dalma, it is the annual sacred hunts or *akhand shikar*, in which approximately 20,000 people take part, damaging the area. In addition, the sanctuary serves as a source of fuelwood to Jamshedpur. While the struggle of the Gujjars in Rajaji is perhaps the most well-known of all these issues, but much less known are affected user groups within Rajaji – former *taungya* workers who were engaged to grow trees and allowed to farm between them, and neighbouring villagers who extract *bhabbar* grass to make ropes. Each document provides a detailed listing of stakeholders and the possible ways their interests may be reconciled, as well as the work of different NGOs in the area. In Kailadevi and Dalma, there are also existing forest protection committees which villagers of forest departments have set up. In Kailadevi there is even an apex body of protecting villages, known as the *Baragaon ki Panchayat*.

The great advantage of this volume is that it provides a clear-eyed, impartial view of existing conditions, lacunae in the law, and what can be done. While obviously engaged in advocacy for the people living in protected areas, the authors account for the views of park authorities and others in a manner that enables future dialogue. To have photographs is, of course, a bonus in any book, but to have such cute cartoons by Rustam Vania is something else entirely. Unfortunately, many of the references in the documents do not find a place in the bibliographies at the end of each document. Minor quibbles apart, the book is a worthy investment for anyone working in this area.

Nandini Sundar

**SUBALTERNS AND SOVEREIGNS: An Anthropological History of Bastar 1854-1996** by Nandini Sundar. Oxford University Press, Delhi, 1997.

THIS first book by a young researcher, Nandini Sundar, recounts the political and social history of the Bastar region from the colonial period to the present. It is an 'anthropological history' in that it engages with recent theoretical debates in anthropology in its analysis of state formation and resistance movements. It is also anthropological in its understanding of history as produced by human action and consciousness, mediated through culture.

Sundar is keenly aware of the pitfalls of writing history, especially of regions such as Bastar which lack significant non-official documentation. But rather than follow the subalternist strategy of rescuing silenced voices from the past by reading official texts in novel ways, she opts for a combination of sources – the archives and other documents, ethnographic fieldwork, and oral histories – to help her piece together the story of Bastar and its people. Her aim is not to present a unitary and finished history but to allow several possible histories to emerge.

By sustaining the dialectical tension among different readings and voices, she is able to convey the complexities of this story and of the theoretical problems it poses. This means that any brief synopsis will inevitably do violence to the subtlety of the argument. However, in this review I do little more than attempt such a summary since I cannot find much to argue with in this rich, insightful and thought-provoking book.

Sundar first dispenses with the commonplace notion that 'tribal' areas such as Bastar were totally isolated and static prior to colonialism. She shows that the

pre-colonial economy, society and polity were characterised by a high degree of fluidity and complexity of interaction among the mosaic of people who came to populate the region. She then presents a theory of how the rule of the Kakatiya dynasty (1323-1947) was legitimised through the institution of divine kingship, focusing especially on the annual Dussehra celebration during which the people expressed their loyalty to the king but also ritually affirmed the king's mutual dependence on them. Significantly, this ceremony was reworked by the British into a ritual display of indirect rule and later was taken over by the independent state to represent itself in its 'reformist mode' (p. 75) through the addition of an exhibition and *darbar*.

As the autonomous Bastar state came under indirect colonial rule, Sundar argues, there was a shift from one form of paternalism to another. In the older system, the authority of the king was circumscribed by an obligation to protect and provide just rule to the people, which was reinforced by the threat of rebellion. The British form of paternalism lacked this element of reciprocity between *raja* and *praja*, for colonial power ultimately did not depend on legitimacy. Thus, while the outward form and rituals of 'traditional' kingship were retained and utilised by the colonial power, the significance of the institution changed over time.

In order to map the shifting equations of power and legitimacy among the three actors in this story – the 'indigenous' ruler, the colonial state and the people – Sundar concentrates on a series of critical events which challenged the political order: the rebellions of 1876, 1910 and 1966. She argues that a focus on insurgent moments can yield an understanding of order as well as resistance, and that the rebellions were in fact central to the constitution of structures of power. Thus her narrative moves back and forth between the rebellions and periods of institutional restructuring and entrenchment which followed them.

The rebellion of 1876 is described against the background of changes in the land revenue, judicial and administrative systems wrought by colonialism. This episode demonstrates that the system of indirect rule was expedient for the British not only because it was cheaper but because it enabled resistance to be deflected onto the native ruler. In the 1876 rebellion, directed against an 'unjust' king, the British were able to project themselves as the protectors of the people and upholders of 'custom'. This ushered in a long period of paternalistic rule in Bastar by the colonial state.

By the late 19th century, British paternalism was encroaching more and more on people's everyday

lives, especially after 1888 when the state was taken under the Court of Wards. The most disruptive interventions were the increased demand for corvée labour (*begar*) and direct forest management. While *begar*, which had both ritual and mundane forms, was integral to the structure and legitimacy of the pre-colonial state, under colonialism its scope and significance was greatly altered: it was transformed into a pure system of conscripted labour for the state's public works projects, especially road building. The construction of roads, seen by the British as bringing 'civilisation' to Bastar, ironically was accomplished through the presumably uncivilised use of forced labour. Moreover, improved communications facilitated the exploitation of local resources for the benefit of non-*adivasi* groups, and enabled new trading groups to move in and occupy crucial niches in the expanding market economy.

The aim of direct forest management was to gain access to the timber needed for the building of the Empire and to generate resources by regulating and taxing the collection of non-timber forest products (NTFPs). In addition, the need to ensure a labour supply required increased control over shifting populations, which was accomplished through changes in the law and judicial process. The new policy turned most villagers into 'criminals' overnight, who consequently were brought under the expanding judicial system for offences such as grazing cattle on the very lands they had occupied for generations. The main target of the authorities was, of course, shifting cultivation, which was regarded as wasteful as well as unremunerative for the state, and the government promoted settled agriculture by encouraging outsiders to settle in Bastar. In all of these developments the roots of present conflicts and struggles can be clearly discerned.

By the early 1900s the state had assumed ownership of all the land, to which people were granted access in accordance with rational forest and land use policies. This marked a complete transformation from the pre-colonial situation when peoples' access to land and resources was governed by a complex of religious beliefs and subsistence practices and organised mainly through the kinship system. The forest policy came into direct conflict with local beliefs that cultivation and village sites were 'gifts' to particular lineages from the 'Earth': for the *adivasis*, displacement or curtailment of shifting cultivation was much more than economic injury. Ironically, this redefinition of peasant's forest rights as privileges granted by the state, to be paid for by labour or cash, later came to be seen as 'customary'.

In this context, it is no coincidence, as Sundar points out, that the 1910 rebellion (*Bhumkal*) began in those very areas where forest reservation was first imposed. This rebellion, which lasted several months and was put down harshly by the colonial authorities, led to further entrenchment of British control. It also produced a debate on the 'tribal question' and some changes in policy. From the 1920s, Bastar was governed by a series of anthropologically-minded administrators who argued for the preservation of tribal cultures, which they thought needed protection from the detrimental influence of Hindu society (a view that ignored the long history of interaction between plains 'Hindus' and hill peoples). This isolationist policy, partly put in place through the codification of 'customary law' and a village panchayat system, produced a particular image of 'tribes' that persists till today, of people who are innocent and in need of uplift but also dangerous and requiring repression.

The debate between preservationists and integrationists (among the latter, nationalists who resented any challenge to the idea of a unitary Indian 'nation') spilled over into the post-independence period and was partially resolved by Nehru's policy of 'controlled integration'. Sundar's account of this period demonstrates how the post-colonial state largely continued the colonial policies *vis-à-vis* tribals, both paternalistic and repressive, through its reservation system, protectionist laws and 'development' programmes. Yet the degree of exploitation of Bastar's people and resources has increased drastically since 1947. The penetration of Bastar by outside commercial interests and government projects, and widespread felling of forests, have led to further disruption in the livelihoods and social organisation of local people.

It is in this context that the 1966 rebellion, led by the last Kakatiya king, Pravir Chandra Bhanj Deo, must be understood. Pravir successfully employed the symbols and rituals of divine kingship to lead a people's struggle against the state. Sundar shows how each successive rebellion contains echoes of earlier ones, and how popular memory feeds into contemporary struggles. However, she argues that the form which this rebellion took should not be interpreted as a reflection of a 'pure' pre-colonial peasant consciousness, but as a 'consciously historical mode of organisation, i.e. one that invoked past myth as a guide to present action' (p. 232).

The debate on assimilation has been revived recently with the proposal to include Bastar under the 6th Schedule. But in the earlier debate, as well as today, there has been a failure to recognise that Bastar

was, and is, already deeply embedded in the wider capitalist economy, not least because the forest departments, mines and plantations draw up on the labour and resources of 'tribal' areas. The isolationists notion that a 'traditional' way of life existed which can be preserved, was misplaced even in the 1950s. But ironically the same ideas continue to be reproduced in new contexts. The argument for special treatment for 'indigenous' people runs the danger of promoting a reactionary nativism in which the interests of certain 'primordial' groups supersede those of others who might be equally oppressed.

Sundar's analysis of the three episodes of rebellion focuses attention on the legitimacy of the state in the eyes of the people. While present conflicts are usually presented in terms of adivasis against the state, these struggles – around the collection and sale of NTFPs, logging, and development projects – foreground issues of development and the direction it should take. These are issues which strike at people's livelihoods, and therefore, although they may be articulated in terms of 'indigenous' rights, pit those who stand to gain from further development along present lines against those who would lose. Herein lies the value of histories such as this one, beyond their academic interest. In formulating a position on such issues it is helpful to know the source of the ideas on which various claims are based.

As Sundar says: 'Any honest attempt to address the "tribal question" must... eschew the idea of harmonious pre-capitalist village communities which are as much of a myth as the notion that activists are motivated by a desire to keep tribals in museums. The question today is one of the effects of capitalism and the struggle for democracy at large, which is fought in culturally specific ways. In the process, culture too is created anew' (pp. 189-90).

This book will be valuable for any scholar of Indian history, politics or sociology, for those concerned with people's movements, or for anyone who is thinking about the state and its future. For, as Sundar compellingly shows, the future can only be constructed out of the remnants of the past. Perhaps a better understanding of the past, especially of people's resistance movements and the forms of consciousness which impelled them, can yield new ideas for the future, new models of governance, and make economic organisation less oppressive and dehumanising than what we have today.

# Comment:

## Gandhi's notion of ahimsa and the human-nature relationship

THE growth of environmental awareness has led to a re-evaluation of the relevance and significance of the legacy of Mahatma Gandhi (1869-1948). The focus has mainly been on the implications of choices of technology and scales of production on the environment and on the ethical underpinnings of an alternative notion of development. One important suggestion in Guha's perceptive cameo of a study is that Gandhi's ideas had more to do with the 'village' than the 'forest' or the 'city'. The careful use of resources within the cultivated settlements was more important to the Mahatma than either the issues that concerned the adivasis or other forest-dependent people or the inhabitants of the growing cities and towns. It was caste Hindu village India rather than the mill workers or the forest-users which was the focal point of his concerns (Guha 1993).

The question examined here has a bearing on the wider debates but is focused on his notion of non-violence *vis a vis* non-human life and how he, as well as some among his followers, tried to put these into practice. The impact of vegetarianism among the Vaishnavas in his native Saurashtra is too well-known to require fresh recounting. It had not only Sanatan Dharma roots, but also Jain antecedents. It was, however, in his student days in England that Gandhi began to develop a philosophy around such beliefs. The interaction with Henry S. Salt as a law student in London was as important as the imprint of the likes of Ruskin and Tolstoy. Salt, the former Eton schoolmaster who influenced Gandhi, was more than a champion of strict vegetarianism. He also opposed fox-hunting, which was then, as now, a major leisure pursuit among the landed gentry and their middle class imitators. His

campaigns for the conservation of wild flowers were later to win support from leading members of the political class (Winsten 1951: 55, 118, 173).

Though Gandhi met Salt and was deeply impressed by his advocacy of animal rights, he did not draw upon his other concerns. This omission may have had a wider logic. Salt was to aggressively take up the issues of hunting and wild flowers a little later than in the early 1890s when he and Gandhi first met. More crucially, the young Mohandas saw the issue of vegetarianism in the light of a re-evaluation of religious teachings: It was no coincidence that he came across a copy of the Holy Bible for the first time in a vegetarian eating house in London (Nanda 1972: 12-13). Compassion extended beyond humans to animals but this did not lead to any sustained engagement with the conservationist concerns of some of his contemporaries.

Yet, the question of human-animal relations resurfaced in the very early stages of his public life. The founding of *ashrams* where life would be organised according to an alternative set of principles was Gandhi's major preoccupation. These included Phoenix in Natal, Sabarmati and Sevagram in India. The aesthetic dimensions of nature were in the background in comparison to another Indian who attempted constructive work in a rural setting, namely Tagore. While he shared Gandhi's apprehensions about the destructive impact of city life, the poet in Tagore identified with features of the landscape with far greater sensitivity. In Gora, for instance, the protagonist walks on the riverside entranced by its beauty, which 'had not been invaded by the ugliness which commercial greed has brought in its train' (Tagore 1924, 1965: 106).

Despite this, Gandhi's later attempts to work out a way of applying his principles of tolerance *vis a vis* the animal world require a closer look. The formulation of the concepts and practice of *satyagraha* or the

\* The author is grateful to Professor Dinesh Singh, Department of Mathematics, Delhi University for drawing his attention to the Ahmedabad incident and to Professor Ravinder Kumar, Tanika Sarkar, Ram Guha and Mahendra Vyas for their suggestions. The usual disclaimers apply.

was a genuine votary of this philosophy, he knew several Jains who fell short of such standards (Gandhi, CW, 25 November and 25 October 1926, CW, vol. 7: 73 and 31: 505-7). There was all too real a danger that ahimsa, instead of being a broad idea, was becoming the 'monopoly of a few timid vaishyas' (Gandhi, 4 November 1926, CW, vol. 31: 524). It would be easy for the mercantile communities to speak of non-killing as the *sine qua non* of ahimsa. But this would only evade the wider problem of their own actions in daily life that increased pain, suffering and violence. By domesticating animals, men had already denied other beings their freedom. The question was of how the line could be drawn in such a way as to root out the desire to hurt other living things. This, and not the mere absence of killing, was ahimsa in action.

Such choices were indeed faced by the next generation of Gandhians. A diverse and mixed crew, their divisions and beliefs are beyond the scope of this paper. But an experience of his disciple Mira Behn at her ashram in the foothills of the Himalaya is illuminating. Gandhiji's own ashrams on the Sabarmati and in Wardha were in largely deforested countryside where the plough and axe had replaced the jungle with villages and fields. Mira's choice of a site was different, being influenced by a love for the mountains, their trees and birds, the wild animals and scenery. The awareness of nature's beauty was a constant and abiding feature of her life. But the process of founding a homestead was far from easy. In 1948, it was necessary in Pashulok Ashram to beat pots and pans at night to scare away wild elephants. She was happy that the forest had a resident tiger. When cattle lifting by the tiger threatened the livelihood of the local pastoralist Gujjars, a hunter sat up on a *macchan* and shot the animal. In her writings about the incident, she echoed Gandhi's view: 'You did us great wrong,' she said (addressing the tiger!), 'I am very sorry about your death. But we had to kill you because we were helpless.' Again, there was a choice between two evils, not an easy one (Gupta 1992: 25-27).

There is a simple but powerful way in which the Mahatma and some of his apostles attempted to address this dilemma. Conflicts often lead to intolerance not only between different groups of people but also with respect to the natural world. Ahimsa was a credo that held the seeds of a solution. But in its application, a practitioner had to be sensitive to the under-privileged, whether the mill worker threatened by stray dogs or the cattle-keeper in conflict with tigers. The wider implications of this are significant. While development

cannot be about economic growth alone, urban environmentalists and animal rights activists can do much more to emulate the Mahatma. Sensitivity to the animal world has to combine with equal attention to disadvantaged people if one is to make any headway. A narrow notion of coexistence can be as damaging as the consumerist notions of development that it seeks to displace.

At the same time, the ideological content of Gandhi's thought has to be assimilated more critically than is often the case. He was not simply drawing on tradition but was critically re-interpreting it. This process was not carried out in the abstract but was often shaped by his engagement with real problems on the ground. At times, these took him well off what most scholars see as the beaten track of his concerns with the village and the peasant. The 'stray dogs' case was a classically urban problem and he saw it as an index of the decay of life in the city. The breakdown of communitarian structures was itself responsible for the existence of stray dogs. He did not see any easy way out by letting the dogs live. That he drew an analogy with villagers confronted by carnivores was instructive. There was no easy choice. The practitioner of non-violence had to evolve responses to real problems, not generate ideal solutions. The abiding relevance of this point in both the city and the forest in India today could provoke a more rigorous re-evaluation of Gandhian thought and practice than the very brief attempt made in this paper.

'struggle for truth' first took place not in India but in South Africa. The Phoenix settlement in Natal province abounded in vipers and other poisonous species of snakes that were a potential threat to human life. Both here and in the ashram at Sabarmati near Ahmedabad, founded in 1917, there was a policy of not killing the reptiles. He also endorsed the superstition among inmates that by not harming the snakes, they too were left alone in turn (Gandhi 1927: 46).

In his public interventions, he was confronted with much more difficult choices. None was to be as controversial in this sphere as the case of the stray dogs of Ahmedabad. This was the only area in which Gandhi had a sustained and long-term interaction with the urban working class. Though heterogeneous in religious terms, they were largely Gujarati speaking. The city also had a significant presence of trading castes — Bania, Marwari and Jain. The spark came due to the actions of the mill-owner Ambalal Sarabhai, a close associate of the Mahatma.

In 1926, a number of rabid stray dogs that had become a menace to workers were shot dead in Ahmedabad at the instance of Sarabhai. Unfortunately, the dead bodies of the dogs were taken in open carts through the market on a day when the *bazaar* was humming with activity. There was outrage among the traders who staged a *hartal* or closure in protest against the cruelty meted out to the animals. The only point on which the two sides could agree was to have the Mahatma arbitrate on the issue. Sarabhai felt he was protecting the workers, his critics that he was being needlessly cruel to living beings.

What is notable is that Gandhi disappointed the traders (Erikson 1967: 422-3). His correspondence on the subject continued for a period of over two years in the pages of his journals, *Navjeevan* and *Young India*. In these articles, he distinguished between his individual belief in *ahimsa* or non-violence and the application of the principle in everyday life. The very existence of stray dogs was an indicator of the irresponsible nature of human society. He did not and could not advocate the wiping out of dogs or any other creatures as a class (Gandhi, 11 November 1926 and 2 December 1926, CW, vol. 27: 14-16 and 28:379). But if there was a choice to be made between a child and a poisonous snake, he would be with the child whose life was in danger. In an article entitled, 'Is this humanity?', he asked if the *ahimsak* (the practitioner of non-violence) did not even have the right to kill in defence of the weak. The reply was in the affirmative. To simply preach coexistence was a luxury. Working out how to apply

it was, the acid test of the practitioner (Gandhi, 25 November 1926, CW, vol. 27: 72-3).

The wider principle that emerged from the incident was that compassion for animals ought not to be seen in isolation. This could not exclude taking difficult decisions. There was ample room for coexistence. Aware of the conflicts in village India where carnivorous animals could pose a threat to flocks of sheep or cattle, Gandhi responded with a sophisticated argument. Villagers often considered it a duty to kill tigers or lions in self-defence. But it was still possible to look forward to a future where life would be different. All animals were our brethren, even the lion and the tiger. It was 'because of our ignorance that, we do not even know how to befriend them. Today, he does not even know how to befriend a man of a different religion or from a different country (Fischer 1950: 238).

In line with the parables of holy men being able to commune with the most ferocious of beasts, of Buddha and the raging tuskier, or of St. Francis of Assisi and the wolf of Gubio, Gandhi hoped to break even this last barrier between human and animal. The pure idealism was nothing short of utopian, but fits in quite well with his general belief in the ability to transform human nature through restraint and to conquer one's adversary with compassion. But his ideal worldview was tempered by calculations that might have appealed to those who lived in proximity to the great beasts of the forest, and sometimes had to defend themselves or their livelihood from attacks. Yet, defence was to be a last resort and not a first response.

The criticisms that greeted such a stance were what led to the series of articles in the journals. But the repartee is also useful for another, more significant reason. Though Gandhi was widely seen as having carried forward older notions of *ahimsa* as propounded by teachers such as Mahavira and other religious leaders, his own reading of the past was sophisticated, if innovative. If he could endorse religion to avoid the wholesale killing of snakes, he could be much more self-critical in other cases. A correspondent asked him how he could ignore the verse that, 'One should not kill even a beast of prey, even if this saves the life of many.' Another critic, this time a Jain visitor, suggested he was violating the letter and spirit of non-violence.

Refuting these ideas, he went well beyond invoking contingency and duty to curb dangerous beasts and poisonous snakes. *Ahimsa*, he felt, was not a monopoly of the Jains, or any other group. In any case, the absence of killing living beings was a critical, but not the sole part of the philosophy of *ahimsa*. While the Mahavira

## The film-maker as activist

IN post colonial India, the genre of the documentary was intrinsically tied up with the ideology of development. In the 1950s and '60s, film, television and radio were regarded as catalysts of modernization, which would involve mass 're-education' through the media, leading to a modern, rational, materialist, democratic culture. In this discourse, 'tradition' was constructed as the main enemy and development strategies aspired towards marketing a new set of discourses related to the body, the family, population, production techniques and the institutions of the state.

This opened up space for various 'experts' to insert themselves as an 'us' (who are middle class/urban/literate), 'using' media artifacts to transform a 'them' (who are poor/rural/illiterate). Documentary film-makers, under the aegis of the state controlled Films Division, celebrated the promise of modernization. There was little space for dissenting voices and marginal(ised) visions. The independent film-maker was beholden to the state for his/her survival. This undoubtedly had its implications for the range of issues tackled – by and large, documentaries tended to stick to 'safe' subjects like art and culture and to the accepted modes of representation.

It is only from the mid-70s that one saw the gradual rise of the 'activist' documentary film, independent of state patronage. Low budget and made with meagre technical resources, many of these films posed a critique of the dominant politico-economic system. They were not the best in terms of craftsmanship, their modes of distribution were limited, and they were screened largely for interested groups, in community or educational settings. With access to video becoming widespread in the '80s, there was a boom in independent documentary production. Many movements in conflict with the state's agenda began to use video. While recognising the contribution of these activist films in providing a voice to marginalised groups and critically interrogating the promise of modernity and progress, we need to rethink the modes of representation used by these films.

Many of these documentaries tend to look at issues in black and white terms. The film-maker becomes, as it were, a mediating entity located outside the relationships of power that (s)he is 'representing'. Accordingly, sympathetic urban middle class viewers could unambiguously situate themselves on the side of 'the people', without having to implicate themselves in these processes. The 'unsympathetic' can dismiss

these films as 'biased' rhetoric. There is a clear-cut dichotomy between the 'good (poor) guys' and the 'bad (elite) guys'. The film-maker becomes an intrepid detective who reveals the machinations of the 'bad guys' to the public. In many cases the film-maker's presence, his/her witnessing the event, is documented for the general public to see. The film-maker was here!

Power flows in this genre of film tend to be two-dimensional, with all oppression stemming from identifiable power sources (the elite, the state, big business) impinging on people, who are constituted as homogenous, cohesive communities, who are always 'right', and thus, imbuing political questions with a moral ring. By allying him/herself with the 'people', the film-maker escapes the onus of self-reflexivity.

The problem with media representations that work with clearly demarcated categories of oppressor and oppressed is that the average urban viewer (usually a sympathiser of the cause being espoused by the film) cannot situate him/herself in any of the above categories. In a study conducted by one of the authors in a working class locality in Goa, public awareness messages on television, which were targeted specifically at the 'masses', were seen as not intended for them by the viewers themselves. The general tendency was to relay these messages to someone else 'more backward', in need of the emancipatory potential of these messages! At the heart of these relaying processes is a dividing practice, originally employed by the sender, in turn redeployed by the 'targets', to invent an 'other' to whom these messages could be eternally transmitted, to a no man's land, for nobody. In effect, the potential of the medium to subvert constituted identities of the viewer (and the film-maker) goes unutilised. The flows of power inherent in these constitutive practices remain unquestioned.

The recognition that any process of representation, such as the act of film making, is an exercise of power/knowledge, would perhaps work towards a critique of the 'normal', the 'everyday', in other words a critique of our own praxis as film-makers, activists. Such an exercise becomes increasingly crucial, given that satellite television is domesticating several of the issues that were once the exclusive realm of 'alternative' film-makers, and an increasing fetishisation of the environment by channels like Discovery begins to set the norms for what constitutes a 'good documentary'.

IS the Buddha smiling? To explode three nuclear devices on the auspicious occasion of Buddha Purnima is blasphemy. It definitely goes against the grain of the Enlightened One's teachings. But then our nuclear estate, our national security establishment and our political class have rarely displayed any trace of enlightenment.

'This is a day all Indians should be proud of,' cooed our Prime Minister, a statement dutifully echoed by all partners in the ruling alliance, leaders of the opposition parties and editorial writers in the fourth estate. Opinion surveys report that their sample respondents were bursting with pride at the great and historic achievement. India had now joined the only club that matters – the club of the nuclear weapon states.

Our scientists have done themselves proud. The debacles of MBT, the LCA or other defense projects can now be safely buried. We have shown the world what we are capable of, given clear goals and unilateral backing. And now having given to ourselves qualities that were rarely apparent – national pride, tenacity of purpose, goal-oriented action – we can rest in peace.

Our security environment has ostensibly improved. After all, we have shown the Pakis their proper place and given clear signal to China that we are not to be trifled with. The apprehension that this series of 'tests' will push Pakistan into exploding its own device, or shift the tenuous balance of power between the civilians and the military does not matter. Nor one suspects does the fuelling of a military (now nuclear) race in the sub-continent. We are, remember, a bigger power and any effort by Pakistan to match us will further cripple them.

The only niggling concern expressed has been about the inevitable sanctions – the cutbacks on aid and loans, the suspension of project talks, or the reduced inflow of funds by foreign investors, thereby affecting the Sensex. But then, our newly discovered machismo, fuelled by American double-speak, has not left the industry unfounded. We can now go *swadeshi* with greater gusto, impose additional import duties, up the tax rates, reduce subsidies. In short, put reforms on the backburner.

To those who do not share this gung-ho mindset, and one must admit that their numbers are depressingly small (at least in the interim), the entire logic appears bizarre. India, quite correctly, had been at the forefront of the movement for a ban on weapons of mass destruc-

tion. It also rightly opposed the CTBT and NPT treaties – given that they further skewed an already skewed global power balance.

Everyone agrees that nuclear weapons should never be deployed, that their use leave no victors. As Achin Vanaik so perceptively notes, 'A nuclear war between two rivals capable of inflicting major nuclear damage on each other must never be fought and cannot in any meaningful sense be won. That is to say, unlike conventional weapons and wars; you cannot have nuclear security through the use of nuclear weapons but only through their non-use.' (*Seminar* 444)

Why then did we do what we did? One argument is that having conducted the tests, we can now sign the CTBT, possibly when Bill Clinton comes visiting. Having joined the club, and having generated the necessary data, we can now play with computer simulations to improve our nuclear weapons capability. The treaty only bans further tests, not weapon development or stockpiling.

As important, what should not be lost sight of is that the government, so far seen as weak, divided and indecisive, has suddenly won the domestic image war. The opposition has been pushed on the back-foot. The stage has been set for a stiffer budget – *swadeshi* style.

Stretch this a little further. The current euphoria will not last indefinitely. So a harder line against Pakistan cannot be ruled out. We have, after all, some 'legitimate' excuses. And the Pakistani establishment, being no different from ours, can be relied upon to provide additional reasons to act decisively. All this appears a leaf out of Indira Gandhi's book. Remember 1972. Engage in a skirmish, dismiss a few state governments, and go to the polls for an outright win. Plausible. Even feasible.

National pride when suffused with jingoism is dangerous. More so when the clarion call is for unity against an external enemy. A classic situation for the suppression of dissent. One just wishes that our leadership had displayed the same purposefulness in solving more elementary problems – of drinking water, of pollution control, of making better roads, or whatever. Maybe then we could really be proud to be Indians in India today. But as the poet says, 'That, my friend, is blowing in the wind.'

## 1998-99 NATIONAL FOUNDATION MEDIA FELLOWSHIPS

### **F**OR CONCERNED YOUNG JOURNALISTS

The National Foundation for India has a programme for young (upto 40 years), mid-career (5-7 years experience) journalists to enable them to take time off to research and publish articles/photo essays on issues related to Gender Equity & Justice (with particular emphasis on the girl child), environment and other development issues.

The Foundation offers five fellowships of Rs.1,00,000/- each, every year. Journalists, specially women from small newspapers are encouraged to apply. One of the Fellowships will be awarded to a photojournalist. It would be desirable for the successful applicants to take leave of about six months to work on the chosen theme.

The last date for receipt of applications is **20th August, 1998**. The results will be announced in November 1998.

For details, contact:

Programme Officer - Media Fellowships Programme

## New from Oxford

### **Wages of Freedom**

**Fifty Years of the Indian  
Nation-State**

**Partha Chatterjee (editor)**

This volume brings together key essays by some of the leading social scientists and political analysts in India. Together, they represent a rich, provocative and compelling set of critical perspectives on the development of the Indian nation-state after Independence. In his introductory essay Partha Chatterjee offers a new theoretical perspective to understand the Indian state as a modern regime of power in relation to the population that it is required to govern.

Rajni Kothari examines the evolution of the democratic process, Prabhat Patnaik reviews the course of economic policy and Achin Vanaik that of foreign policy. Javeed Alam and Aditya Nigam discuss the course of communist politics and M.S.S. Pandian that of the Dravida movement. Tapati Guha-Thakurta deals with the official construction of an art heritage for the nation, M. Madhava Prasad with the relation between the state and the world of Bombay films, and Sudipta Kaviraj reflects on the languages and poetics of democracy.

Moving from central structures to the margins, the volume offers critical views of the nation-state as seen from the peripheral zones: Nivedita Menon examines the attempt to redefine state policy on women, Kancha Ilaiah offers a history of the evolution of dalit politics, and Subir Bhowmick tells the story of the northeastern states.

# COMMON CAUSE

A REGISTERED SOCIETY

## AN ORGANISATION FOR VENTILATING COMMON PROBLEMS OF THE PEOPLE

COMMON CAUSE has established itself as the public interest organisation which has taken up a large number of important cases for redressal. It takes up only collective problems of All-India importance or of large area interest. It has demonstrated that public causes, for which redressal may not be forthcoming by knocking at the doors of government functionaries, have necessarily to be taken to the relevant superior courts which are in a position to issue directions to the government.

Problems of the people have vastly multiplied and proliferated in recent times. Increasingly, therefore, intermediacy of courts has become necessary, through the instrument of public interest litigation (PIL), to deal with these problems.

COMMON CAUSE is now shifting to its spacious new premises on Nelson Mandela Road, Vasant Kunj, New Delhi. It is looking for people who will support its activities.

### SENIOR EXECUTIVES

Persons who would have recently retired from senior positions in government, public or private sector; who are in sound health, and can devote at least 4 days a week. Some legal experience would be an advantage. They will spearhead our efforts in areas of concern, such as Property Laws, Consumer Grievances, inadequacies of governmental functioning, under the guidance of the Director. The work involves researching the subject, formulating action plans, and implementing them through the courts or otherwise. This is public service of a high

order, and Common Cause can only defray all expenses incurred such as transport etc. and provide a small honorarium.

### EXECUTIVES and ASSOCIATES

Persons with some administrative experience who would assist a Senior Executive in obtaining information, researching facts, interviewing people, maintaining records etc. ASSOCIATES with shorthand, typing and computer experience are also required. Costs will be reimbursed, and a suitable honorarium will be provided.

### LEGAL EXECUTIVE

Practicing lawyers and solicitors who are willing to devote some time to the problems of the people by preparing Writ Petitions and other legal documents on the basis of information and documentation given to them for the various cases that Common Cause is pursuing. Fees that can be paid would necessarily be small.

The cause is a large and public one to improve things for the people. Only those for whom this is an exciting and meaningful role will be able to do justice to it.

Interested persons for SENIOR EXECUTIVES, EXECUTIVES and ASSOCIATES may please send their bio-data to the Director, Common Cause, A-31, West End, New Delhi 110 021. Those willing to act as LEGAL EXECUTIVES may send a brief note on their area of expertise and some relevant personal information to the same address.

## **MAULANA ABUL KALAM AZAD INSTITUTE OF ASIAN STUDIES**

Positions at various levels are open in the Maulana Abul Kalam Azad Institute of Asian Studies, a research institute on Asian Studies, set up under the auspices of the Department of Culture, Government of India, in Calcutta, in the research programmes on (a) issues of social transformation like nationalism, ethnicity, governance, democracy, economic and social restructuring, demographic and ecological changes, etc.; (b) borders and transborder flows, and (c) conflicts, conflict resolution and peace studies, with particular reference to Central Asia, Northwest Asia and South Asia. These research programmes are framed in the context of modern, historical, social and political movements and the economic situation in these three regions. The countries which receive special emphasis in research work in this Institute are Turkey, Iran, Afghanistan, the five CIS countries of Central Asia – Tajikistan, Turkmenistan, Uzbekistan, Kyrgyzstan and Kazakhstan, and in South Asia, Bangladesh. Research proposals with comparative framework are particularly welcome. Knowledge of one or more languages of these regions is desirable, though not obligatory. Similarly, knowledge of any European language in which studies of these regions have been conducted is desirable. Research scholars from M.Phil/Ph.D level to Professorial level may apply. Arrangements regarding tenure and pay can be decided on the basis of discussions with the candidates. Junior level researchers will pursue in the Institute their Ph.D work connected to Asian Studies and in particular to the research themes mentioned above. Senior level researchers are expected to design and run courses, conduct seminars and participate in publications programme. Applicants at all levels are requested to submit their applications along with a 3000 word summary of their research proposals which will be accorded equal importance with their career ratings. Senior Professors may recommend names of suitable candidates also. Selection will be on the basis of curriculum vitae, interviews, research proposals and seminar presentations. The Institute also reserves the right to offer positions to researchers highly recommended by acknowledged experts. Interested researchers are requested to submit their applications along with full details including requisite research proposal, a statement of the past work done and a list of three referees, **within 30th June 1998**, to the **Director, Maulana Abul Kalam Azad Institute of Asian Studies, 567, Diamond Harbour Road (2nd & 3rd floors), Behala, Calcutta 700034; Phone/Fax: (91) (33) 468-1396/4634**. Advance applications through e-mail (makeias@cal.vsnl.net.in) will also be acceptable.

**Applicants may contact the Director, in case further information is found necessary.**

**Sri Madhava Ashish**

**NEW FROM BANYAN BOOKS**

A collection of essays, articles and letters in which the author, Sri Madhava Ashish, seeks to examine the values which underlie social ethics and environmental issues. Many of these themes engaged Madhava Ashish during his life at Mirtola, a small ashram near Almora in the Kumaon hills of northern India.

His teaching evolved beyond a purely religious form, in his search for the meaning of life. His work emphasised the need to integrate the inner reality with an active committed outer life.

*These writings are interspersed with incisive, poignant and stimulating letters exchanged between Raj and Romesh Thapar, founders of Seminar magazine, and Madhava Ashish.*

## **RELATING TO REALITY**

**Relating the metaphysical roots of value to their applications in every field  
of human activity**

**Orient Longman**

**ANTHROPOLOGICAL JOURNEYS**

**Reflections on Fieldwork** edited by *Meenakshi Thapan*

81 250 1221 4

Rs 275.00

This collection of papers raise questions concerning the traditional nature of anthropology, and address current issues and debates in sociology and social anthropology. Distinguished anthropologists examine their own fieldwork experiences. The result is a rigorous and deeply moving analysis that leads to an unlearning of inappropriate and insensitive methods that obscure rather than explain the lives of people.

**THE CONTESTED TERRAIN**

**Perspectives on Education in India**

edited by *Sabyasachi Bhattacharya*

81 250 1429 2

Rs 425.00

This collection of essays aims at providing a comparative and historical perspective on education in modern India. The nationalist discourse and its effect on educational policies is critically examined. The issues include how the nationalist school attempted to negotiate a space for science and technology, at the same time rejecting the colonization of the education system. The book also explores the inequalities in the distribution of educational opportunities and the material benefits secured by those with access to education.

***Fifty Years of Quality Publishing***

Orient Longman Limited, 3-6-272 Himayatnagar, Hyderabad 500 029

**EKLAVYA**

*Institute For Educational Research And Innovative Action*

**Seeking Involvement Of Experienced Academicians In Educational Programmes**

Working in institutions of higher education and research in the country you may have faced students who do not know what you feel they should have learnt at school. You may also have had direct experience of schools through the children around you. The appalling quality of school education is a major cause for concern. You might have felt that a lot needs to be done to overhaul the system.

**Here is an opportunity to get involved in an attempt to transform the quality of school education.**

Eklavya is a non-government organisation working in the field of elementary education, publications and community involvement in social, cultural and developmental issues. It works in collaboration with the government school system in 14 districts of Madhya Pradesh. At the same time it contributes to programmes in different parts of the country. Eklavya is keen to widen its involvement and collaboration with senior faculty members.

You could contribute by:

- reviewing curriculum and materials in various subjects, formulating trial curricula and materials, teacher trainings and orientation, developing methods of pupil evaluation.
- Developing and implementing programme evaluations.
- Designing and conducting studies on various issues, for example how children learn concepts, or how teachers and adults internalise new ideas in education.
- writing articles for our children's magazine (Chakmak), teacher's magazine (Sandarbh) & Science feature service (Sröte).
- helping to conceptualise and develop new titles for our publications programme.

You could also contribute with new ideas for future work.

*Eklavya would like to invite responses from experienced academicians for involvement in its work in any of the following ways:*

- as resource persons for its various programmes (individually or as part of joint collaborations between our respective institutions)
- as resource persons on fixed term fellowships or
- as full time persons in the organisation

**Please write to us at the earliest with full details about yourself and your areas of interest in education.**

We are scheduled to have a number of teacher training programmes in science, social-science and the teaching of language and mathematics in the months of May and June. An early response from you will make it possible to arrange your visit to these trainings, as they provide a good opportunity to interact and share mutual interests. Write to us at:

**Eklavya, E-1/25, Arera Colony, Bhopal, M.P. 462016, Ph. (0755) 563380, Fax (0755) 567552**

You could also contact Dr. R.K. Agnihotri (7213963) or Dr. A. Mukherji (2280870) at Delhi, or Dr. U. Yajnik (5783323) at Mumbai, for details.

**NEW TITLE FROM MADHYAM BOOKS****A CITIZEN'S GUIDE TO THE  
GLOBALISATION OF FINANCE****Kavaljit Singh**

Written in a non-technical style and language, the guide provides a key to understand the operations of global finance capital which has very little to do with real economy. The adverse impact of these financial flows on the national economies is taken up for analysis, concentrating on the currency crisis that erupted in Mexico, and the ongoing currency turmoil in various Southeast Asian countries. The dangers of India's recent moves towards opening its doors to such financial flows are emphasised. The book calls for effective regulatory mechanisms and pleads for mass public action to implement these and exercise social control over global finance capital. The guide also provides resources for further research and action. It will be useful to concerned citizens, activists, NGOs, students and all those interested to know the global finance capital.

**1998                      Pages 200                      Rs. 120**

**NEW TITLE FROM MADHYAM BOOKS****THE GLOBAL MEDIA**

THE NEW MISSIONARIES OF CORPORATE CAPITALISM  
**Edward S. Herman and Robert W. McChesney**

*The Global Media* describes in detail the recent rapid growth and crossborder activities and linkages of an industry largely composed of TNCs. It assesses the significance of the ongoing deregulation and convergence of global media and telecommunications systems and the rise of the Internet. The authors argue that the most important features of this globalisation process are the implantation, consolidation and concentration of advertisement-based commercial media and the parallel weakening of public broadcasting systems worldwide, with negative consequences for the 'public sphere.' It is contended that the United States provides the evolutionary model toward which the global media system is moving, and the history and characteristics of the U.S. system are described, along with developments in seven other countries including India. Finally, the authors evaluate the defenses of the ongoing globalisation process and discuss the forms of local, national and global resistance that have emerged.

**1998                      Pages 272                      Rs. 175                      Regd. Post Free!**

**Interest calculation to your advantage**

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

**No prepayment penalty**

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

**No annual charge**

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

**No commitment charge**

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan – not before.

**Processing charge on a 'slab' basis**

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

*Loans at the sole discretion of ANZ Grindlays Bank.*

THE MONTHLY SYMPOSIUM POST BOX 338 NEW DELHI 110001

Founder Editors RAJ & ROMESH THAPAR

A journal which seeks to reflect through free discussion, every shade of Indian thought and aspiration. Each month, a single problem is debated by writers belonging to different persuasions. Opinions expressed have ranged from Janata to Congress, from sarvodaya to communist to independent. And

the non-political specialist too has voiced his views. In this way it has been possible to answer a real need of today, to gather the facts and ideas of this age and to help thinking people arrive at a certain degree of cohesion and clarity in facing the problems of economics, of politics, of culture

# The problem

FOR a society with as rich and varied a heritage as India the quality and extent of its conservation efforts often causes a great deal of concern. This anguish becomes even more acute when we see what other societies, much more recent and with much less to be proud of, do to protect and showcase their heritage.

Why is this so? Is it that we have no interest, no pride in our past? This hardly seems tenable given that our leaders never tire of extolling the virtues of Indian civilization. Or is it, as some have sought to argue, that India and Indians are ahistorical, in the western sense of the term. What we value are living traditions, not relics of the past. Or is it that conservation is seen as an elitist concern – one that involves large sums of money, in addition to technology and expertise, that a poor society like ours just cannot afford?

Conservation of our man-made heritage – buildings, temples, forts, even cities or, at another level, paintings, statues, manuscripts and so on – is in its essence a reflection of a political decision taken by a society and its leadership. This becomes even more marked since choices have to be and are made about what to conserve and how. In a society where each site, each symbol, is riven with conflicting claims – of use, of ownership – choice becomes a complex exercise. Should we direct our scarce resources towards the Taj or the ruins of Hampi, the cave temples with their intricate rock-cut images and wall paintings or the wooden architecture of Kerala?

The choice of the site, the period, the style, is reflective of the symbolic value that our society, more so the current generation, invests in our heritage. The tussle is not merely symbolic – whether we want to foreground our Hindu, Buddhist, Islamic, colonial or syncretic past. There is also an extant material conflict, particularly over sites. The Taj, for instance,

is surrounded by hundreds of small foundries and factories. Adequately protecting the monument may involve, as the Supreme Court judgement indicates, relocating many of these and this can never be easy or painless.

It is our belief that though the term conservation is generally used in limited and specialised circles, it affects all of us as citizens. Even in our sub-conscious, most of us have an affinity with some monument, some building, some place of worship which has a historical origin. India's built heritage as well as the art works which go with them is multi-layered and regionally diverse. It is this enormous variety which has contributed to our essentially tolerant cultural legacy. It helps us read our history as a complex mosaic in which everyone has a place. Conserving this heritage, therefore, is not merely a transmission of historical memory for Indians but for the world citizen.

The task of exploring, excavating and preserving this legacy primarily falls on the Archaeological Survey of India and the state archaeology departments as well as art conservation institutions such as the National Museum in Delhi, the Victoria Memorial in Calcutta and the National Research Laboratory for the Conservation of Historic Property in Lucknow. We now also have NGOs like INTACH, the Indian Heritage Society and others who have begun to take on some of these responsibilities. Attention is also turning towards the historic properties which underline the special characteristic of cities such as Calcutta, Mumbai, Hyderabad, Lucknow and Chennai – their precincts, streetscapes, historic landscapes, gardens, even natural features such as lakes and rock formations.

Conserving all this requires both funds as well as human resources. India may have made some progress, especially in comparison to other develop-

ing countries, but it is a moot point whether it has done all that it could have. Its vast potential still lies unused and unexploited. Only 16 sites in a land of such immense variety have been recognised as World Heritage Sites by UNESCO. Have we then failed to protect our rich legacy appropriately? While many of our heritage sites languish in obscurity, difficult to access, others are becoming victims of ungainly developments in their surroundings.

If there is a failure of will, then it surely needs to be addressed. Or is it that we suffer the usual malaise of inadequate coordination between the various agencies mandated to support the different conservation bodies? Or is it that fresh thinking and action is needed to make our heritage sites visitor friendly through better site management, interpretation centres and so on. It does appear that some premier organisations like the ASI have begun to acknowledge the difficulties involved and have initiated steps to source inputs from other specialised agencies.

A major problem is that our conservation strategy, such as it is, is much too officialised and expert oriented. There is a palpable fear of involving the people in this cultural project. Notwithstanding constant refrain about shortage of funds, little effort has been made to involve corporate entities and private trusts in investing in, adopting, contributing to and managing our heritage sites. Why, even the Japanese aid to develop key Buddhist sites remains unutilised.

Within conservation circles there are numerous debates with regard to the principles of conservation, authenticity in conservation, the different philosophical approaches to conservation and so on. Two issues, however, tend to crop up repeatedly. One has to do with the impact of tourism on conservation; the other

whether a poor country can afford to conserve. The two are related. If one supports a view that tourism is inherently antithetical to conservation, then one axiomatically rules out the possibility of generating revenues through this route. This may well strengthen the resource paucity argument.

Without for a moment underplaying the hazards – aesthetic, ecological, cultural – of unbridled tourism, it does need to be recognised that only if the mass of the people have a chance to visit and appreciate our heritage, can we generate the interest and goodwill required for successful conservation. We need to conserve given the intrinsic civilizational worth of our heritage; it is this that makes us what we are. Generating revenues through intelligent site management is an additional bonus.

Equally important is the need to protect our heritage sites and buildings through appropriate conservation legislation. Legislators act only if there is public pressure. Possibly because our buildings and sites are kept wrapped up in officialdom, barring Hyderabad and Mumbai, none of our cities, even the oldest, Benaras, are protected by legislation. No wonder, Ghalib's house in the walled city of Delhi is being used as a coal depot and historic buildings in Mehrauli are being converted to shopping arcades.

It is time that we move beyond these debates and assess how the conflicting claims in the conservation enterprise are reconciled in other countries, not just those of the West but also closer home such as Sri Lanka and China. We also need to initiate fresh dialogue between different sectors and agencies with a stake in conservation. This issue of *Seminar* is a small attempt in this direction.

ASHIS BANERJEE

# Civilizational concerns

B. P. SINGH

WHY does one love India? Is it because one is a citizen of this country; because one owns a house here or one has his friends, relations, forefathers living in this land; or is it something deeper? Rabindranath Tagore aptly answers this question in his essay, 'A Vision of Indian History': 'I love India, not because I cultivate the idolatry of geography, nor because I have had the chance to be born in her soil, but because she has saved through tumultuous ages the living words that have issued from the illuminated consciousness of her great sons.' This love has both tangible and intangible expressions. One has to preserve both. This is a challenge which is more than 5000 years old.

India, Egypt, Iraq, Greece and China have been recognised as the five cradles of human civilization. The ancient civilization of India, however, differs from the others in that its traditions have remained intact to the

present day. In this respect it is like China. In fact, both India and China can claim to have the oldest continuous cultural traditions in the world. This continuity of cultural traditions has endowed us with a rich and varied heritage in its myriad expressions – literature, music, dance, drama, painting, sculpture and architecture.

In a wider sense, history encompasses the development of human consciousness, a handing over or easy passage of ideas and beliefs from one generation to the other. As a remarkable feat of conservation of memory, the Indians, through the tradition of *smriti* and *sruti*, have passed on the Ramayana, Mahabharata, Bhagavad Gita and other sacred texts to the present day. The Vedas are believed to be divine revelations (*sruti*). The term *smriti* signifies an oral tradition wherein the teachers passed on to their students the texts which they themselves had received from their masters.

The *guru-shishya parampara* (teacher-student tradition) was a significant institution that emerged out of these two traditions. Teaching was perceived to be a religious duty of the Brahmins and students were sent to live with a guru to learn not only the scriptures but also statecraft, music, warfare, science, and agriculture. In time, a student would attain the status of a guru and carry on the tradition of transmitting knowledge to his disciples. The institution of *guru-shishya parampara* covered the entire gamut of creative activity – religious discourse, history, dance, drama, poetry, painting, and sculpture. In this process, the learned mind renewed the sacred texts in the light of new social, religious, and economic realities as the guru was required to interpret the scriptures to find answers to emerging problems.

The institution of *guru-shishya parampara* declined over the years and now survives mainly in the realm of music and dance. New schools and institutions, seminar and discussion forums have emerged, replacing in a way the traditional modes of learning. The development of written manuscripts, followed by the technology of printing books and journals, and the storage of classics in computer software today has ensured that we do not lose anything of the past. However, the present system has its own inadequacy, as the renewal that occurred through dialogue in the old tradition is not a part of computer software. There is no denying that archives, libraries and computer technology play an important part in the conservation and interpretation of the past. But their role has been more in the realm of maintenance of texts rather than in their renewal. Renewal comes by using, by doing, by making the past an effective force in the present.

Conservation was part of thought, action and deed of the various communities who inhabited this land. Nature's gifts have been worshipped by our ancestors, sometimes with a sense of fear of the unknown, and at a later stage of evolution of man, as appreciation for the beauty and splendour of nature. To cite an example, early man realized that water was a life giving force, that he needed clean water for all his needs. This led to worship of water along with other natural elements such as the sun, the wind, the plants.

The Indian creative genius was not satisfied with a mere dictat that 'water must be kept clean'. He visualized the source in the snow-capped mountains, in the beautiful running streams which became mighty rivers as they flowed through the plains to reach the great oceans. He worshipped these rivers by giving them names – an identity. Poets wrote verses describing their beauty, sculptors and painters made icons of their forms, musicians and dancers sang their praises and showed, through movement and gesture, the life, as it were, of these human characters which were the rivers. Hence a physical necessity which was the river (water) became a cultural necessity. In conservation, we must realise that there is a thin line, if at all, which divides natural and cultural heritage.

Many art forms today are facing extinction given the growing insensitivity of the public to the aesthetic and cultural values expressed in these forms. There are numerous creative expressions that stem from religious beliefs, rituals and ceremonies. We need in-depth research and study to list out the people connected with the manifestations of the expression of these forms – experts and scholars, artisans, performers, jewellers, costume

and mask-makers and so on. For conserving heritage, an acknowledged methodology which has proved effective is the process of 'documentation'.

There is a crying need to document our creative expressions. This will not only be of use to future researchers but a good documentation team can facilitate the renewal and rejuvenation of the art form, as it works with the members of the community engaged in the creation of the art form, and encourages these people to achieve further excellence. Sophisticated advanced technology available today facilitates the documentation and dissemination of the arts. With new technology at hand, it is necessary to take an overall look at the present state of the arts and develop a methodology best suited for documenting the rich artistic heritage and living traditions of each region.

Due to the pluralistic nature and the diversity in the manifestations of Indian artistic expressions, there is a need to develop a comprehensive methodology for their documentation and conservation. It is important to understand the complex web of the forms and ideas manifest in the creative expressions. The cultural heritage forms a part of the life of the people of this land and each geo-physical and cultural region has contributed to its growth. To the spatial diversity is also added the time dimension. On this plane, which may be seen as a vertical frame, lies the dynamic process of continuity and change in each area.

While conserving what was beautiful in the cultural ethos and essential for life in nature, man, through several creative expressions, brought dignity, elegance and grace into his own life as well as in the lives of the members of the community in each region of this country. Today, the first concern is of maintaining and sustaining the

richness of India's cultural diversity. The second concern is with its historical development. With advancements in every field it is necessary to ensure that citizens share the benefits of progress and freedom. These two concerns, that is, development and conservation of our heritage, are not contrary or in opposition to one another. Modernization clashes with indigenous cultures and pluralistic society when it is artificially transplanted from a foreign mould onto an organic culture. The super-imposition of alien norms and systems will not take root in a living, growing society, which has its own unique character and essence. A diverse, pluralistic society must be allowed to develop and preserve its own culture.

**R**ural India has its rituals, songs, dances, creative forms related to seasons, which are in turn linked to the occupations of agricultural communities. The idea and philosophy inherent in the art form, the season or the geographical setting, the social context of a particular community are inextricably linked together. This integrated understanding of the living tradition requires that a suitable framework for documentation be developed to incorporate those aspects that give meaning to it and which are the source of the art. Yet another phenomena that deserves careful attention is the inter-relationship of the arts. Each art form is linked to religious, social, environmental and economic considerations.

In many instances, specially in the performing arts such as theatre, music, dance, drama, mime and acrobatics; literature, painting, mask making and stylized make-up combine to form a composite whole. There are paintings that interpret music and poetry, as also musical forms that narrate or recite literary works. There is a wealth of literature in India which

finds expression in all the performing arts and historical evidence of the evolution of the arts may be found in literature, sculpture and painting. This has primarily been responsible for the continuity of Indian cultural traditions such that, even today in 1998, one has episodes from the epics like the Mahabharata or the Ramayana being sung, danced, dramatized and communicated through many of the artistic expressions.

**H**owever, as we are about to complete another millennium, there are situations created by technical development and scientific advancement that may lead to the corrosion of the essence of aesthetic norms, creating disharmony in the structure of our lives. The easy way of life that allowed for contemplation and communication of the finest concepts, and the mental repose that allowed for participation in the creation of beauty, have been lost to a fast and gruelling pace of life. The story-teller using indigenous audio-visual expressions stemming from traditional values in the rural areas, sitting before his painted scroll subtly utilizing the language of gesture and music, enthraling audiences for long nights is today present in urban homes through television and video films. His entire cultural repertoire which lasted for several nights is now tailored to a mere 20 minute performance. How this has affected the core of our culture is an issue of concern for the conservationist.

Man created beautiful objects of utility, each designed with great love and care, striving for excellence in the preparation of each object. We call these objects of utility 'craft items' today and look at them from a consumer angle where they have to be mass produced for use as decorative pieces in urban homes or for export. But this does no good to the creator or

the article. Similarly, hand-written illustrated manuscripts on palm leaves affected the psyche in a way no printed book, however well produced, can. The joy of reading the text combined a cerebral activity with beauty in line and colour expressing the essence of the episode of the text. Each leaf was picked up and read and put back carefully as it was a work of art. Mass production does have its advantages but it does not add to the qualitative refinement of the soul.

The fact that the need for conservation/preservation did not arise till recently in India was due to the close relationship and relevance of the arts with the daily life of man. The impact of modernisation and development of industry has now created the need for conserving the natural and cultural heritage. A song that was sung for a particular occasion, viz., sowing or harvesting, is no longer relevant when tractors and other machines have taken over the work done by human beings. At best, the song will be recorded, documented and may later be taught to people unconnected with agriculture, but who enjoy it for purely aesthetic purposes. Or it may be forgotten and a whole body of musical traditions that are related to work and occupation or the life cycle may just disappear.

**I**n evolving a strategy for heritage awareness, there is a need for developing information packages for various target groups – the media, decision-makers, local authorities, the private sector and local communities. The conservationist must understand that a classification system of cultural property represents an approach, an ideology and an emphasis, with its in-built element of subjectivity. In India, there exists a wide-ranging practice of using western or English terminology for classification. This

practice has led to many difficulties. For example, the term 'folk' as used in English, and used by us as a qualifier in 'folk music', is imprecise and biased. In India, 80 per cent of the people live in villages and each rural community has its own musical forms related to occupation, religion and historical evolution.

**T**he musical forms of such communities may relate to the celebration of the harvest festival, change of season or related religious or social events. Folk music may not seem to have a codified grammar related to the discipline of sound and rhythm, or be sung to a specific *raga* or *tala* as in the classical forms of music. Yet, it does have a certain degree of abstraction and is of great symbolic value. It cannot be captioned as 'primitive', 'naïve' or 'folk'. The term folk in India cannot be used with any accuracy. Similar problems have occurred with words like 'classical' or 'ritual'.

India has a rich heritage of folklore which includes myths, legends and other stories that have been passed down from generation to generation through a variety of narrative forms available in different parts of the country. In the rural and tribal areas, members of the community are the custodians of this cultural heritage, which has survived through millennia. It has been enriched by successive generations who have added to its beauty and aesthetics, a special sensitivity which characterises the natural and cultural ethos of the community. The unity and diversity of this vast sub-continent can be seen through its folklore which expresses a thematic unity in myriad forms, influenced by the local and cultural traditions.

There are several other aspects that need to be sensitized to the core of our cultural beliefs and aesthetic values. One would like to highlight the

role of mass media, radio, television, books and magazines which influence and help build the value systems of a society. Various individuals and organisations have sacrificed a more comfortable way of life and opposed the building of dams if they fear uprooting of people and destruction of the eco-system. The Chipko movement was a unique and unheard of method used to stop the felling of trees. And this can be expected only in a land where the felling of one tree was preceded by the planting of 18 or more trees to the accompaniment of processions of dancers, musicians, singing verses addressed to the sky, the mother earth, the birds and so on, begging forgiveness for disrupting their lives. What a treasure-house of values expressed through literary, visual and the performing arts combining the need for conservation of the natural environment with creativity! This practice is still alive in many parts of the country.

**S**o many of our cultural traditions and art forms are on the brink of extinction. They may be lost in the hustle and bustle of mankind's preoccupation with material gains and an accelerated pace of life. Today, there are many cultural forms on which depends the quality of life of entire communities. They are our heritage, our past, on whose foundation our future shall stand tall and beautiful. If the foundation is wiped out then we shall be paupers, bankrupt in spirit and soul. It is, therefore, imperative that the government intervenes effectively in the task of heritage conservation and simultaneously enlists the participation of the community at large, and the private sector in particular, in this mammoth effort.

India's rich cultural heritage stands amply demonstrated in its various cultural sites and monuments.

They reflect a point of evolution that we had attained in ancient times. Some of these monuments and sites have been acclaimed the world over as of universal importance and are included in the World Heritage List of UNESCO. The monuments are, however, important not only architecturally but also from the point of view of history. It is, therefore, crucial to protect and conserve them.

**H**owever, this job is not an easy one. There are the pressures of development which often supplant the socio-cultural sensibilities of the people: the increased tourist traffic and the unreasonable demands made in the name of tourism; the rapid urbanization which has made most of our town planning efforts irrelevant and has, in many an instance, irreversibly altered the ambience of our cultural and historical sites; a population which is bursting at the seams, much of which lives in dire poverty in slums and ghettos; a tendency of some persons to exploit religious monuments for commercial ends; and so on. All these pressures, in their totality, threaten to irreparably damage our tangible heritage.

Both in the recorded history of civilization and in mythology the finest works of art and sculpture were always meant for places of worship. In fact, the dwellings of the Creator invariably occupied a higher status than those of kings, chieftains and the ruling elite. Most of our monuments, therefore, are intended as homage to the Creator. In the very nature of things a massive and/or uncontrolled entry of tourists to these places goes against the sacredness of these monuments. Yet, tourism is necessary both for the national economy and for sharing our knowledge, culture and values with the rest of the world. Also, tourists have often helped to focus

attention on the monuments in several developing countries, and India is no exception.

A matter of immediate concern is the state's vulnerability in matters of religion. It is unfortunate that the government has shied away from dealing severely with the offenders for fear that it might be dubbed as partisan, pro or anti one or the other religious group. Taking advantage of this fear and vulnerability of the system, unscrupulous and greedy people act with impunity for commercial gain. They have tried to occupy and politicise monuments which, over time, had ceased to be places of prayer and worship. Many such monuments have been taken over by the state for conservation and protection and declared as protected monuments. Such instances are many and are not limited to any one religious group.

**T**he prime question is how to protect this cultural property. In my view protection of cultural property has two inter-related aspects: the first includes historical sites, buildings, temples and other places of worship, works of art, and other such physical manifestations; the second relates to human skills, and attitudes which constitute the driving thrust in an individual towards the creation of works of glory and excellence. It must be appreciated that these skills and attitudes are not static, nor can cultural manifestations conform to being replicas of past buildings, temples, dance forms, or lyrics. Cultural manifestations are undergoing transformation in terms of revolution in communication, technology, environment, and the impact that the wider world is increasingly making on us. The Archaeological Survey of India (ASI) is primarily concerned with the physical aspects of conservation of our cultural heritage, but it can perform this task efficiently

only when it is sensitive to the second aspect of preservation mentioned above.

In matters relating to the physical aspects of conservation, there is need to appreciate the role that the local people have played in maintaining heritage monuments and in viewing them as a part of their cultural personality since time immemorial. In fact, cultural heritage plays a critical role in fostering a sense of cultural personality, an essential condition for development and social stability.

**T**here is need to complete documentation of each site monument under the control of the ASI and simultaneously to move towards the preparation of a national register of historic sites and monuments. Towards this end, not only does the ongoing survey process need to be given a special thrust, it must also include aerial photography. The documentation must conform to internationally accepted standards.

Of the various activities entrusted to the ASI, the most important are those of conservation and preservation of archaeological heritage which includes monuments and sites, as well as loose antiquities in the form of sculptures and architectural members. While only 3500 monuments and sites are included in its protection list, the actual number may exceed 5000 since, in many cases, groups of monuments are listed singly or monuments located inside large forts covering an extensive area are included as a single monument.

This archaeological heritage comprising both secular as well as religious buildings is distributed over the entire country, in different climes – the arid to monsoonal, high altitude to coastal areas, mountainous to flat plains, and from forests to deserts. A large number of monuments are

located in extreme climatic conditions, like those in the freezing cold of Ladakh, the desert of Rajasthan, coastal areas, and areas with heavy rainfall. Coupled with this ecological and geological diversity is the variation from remote villages to densely populated areas including metropolises. Some of the sites have no basic amenities like electricity and water. Sometimes even water for conservation works has to be brought from a considerable distance, leave alone the building material. This heritage spans a long period of history – dating from about one hundred thousand years ago to just a few hundred years back.

This variety does not allow the application of any uniform method of conservation. The conservation of a monument implies preserving its setting. Wherever a traditional setting exists, it must be conserved. In other words, the original personality of a monument has to be preserved. No new constructions or modifications which would materially alter the relations of mass and colour should be allowed. A monument is inseparable from the history to which it bears witness, and from the setting in which it is located. The moving of all or a part of a monument cannot be allowed except where the safeguarding of that monument demands it.

**C**onservation is a process to prolong the life of a monument. Each monument or archaeological site has its own unique problems which need to be addressed keeping in view only that particular monument or site. Thus, for example, the problems of conservation of the Leh palace or the brick temples at Bishnupur would be different altogether in comparison to the problems of conservation of the excavated remains at Lothal or the coastal temple at Mamallapuram. These problems are further com-

pounded by several other features such as the materials used in construction, varying degrees of disrepair or damage to the structure, difficulty with regard to availability of materials or even skilled artisans and, finally, the constant threat due to environmental degradation and the drastic change in the milieu from when the monuments were built.

**Q**ualitative information, coherently compiled, collated and disseminated, can become the single most powerful tool for the protection and preservation of India's rich and diverse cultural heritage. The responsibility for the preservation and protection of the 5,000 nationally protected monuments, however, must rest exclusively with the ASI. This approach suggests that INTACH and other voluntary organizations should cooperate with ASI on specific issues related to the site. This would include planning and development of appurtenant lands and, where applicable, the management of such monuments which because of historic reasons are unprotected but are an integral part of the complex. The voluntary organizations could also assist in infrastructure and community integration works.

While undertaking the conservation of a monument, several factors have to be taken into consideration, such as using the same material, preserving its original personality, the degree of intervention required, and so on. We may cite an example to illustrate this point. Given its location on the seashore, considerable damage had been caused to the stones used in the construction of the Dwarakadhish temple in Gujarat. It had, therefore, become necessary to replace the damaged stones by new ones and the work had to be carried out without interfering with the rites and rituals, or causing inconvenience to the pilgrims. For

replacing the badly weathered stones of the temple, a quarry with similar stone was located at Baradia, not far from the site. Eventually, the quarry ran out of stone and another quarry was located about 200 km from the monument. Transporting the large stones from the quarry to the temple site posed a problem, but was eventually solved with great difficulty. It may be mentioned that no heavy machinery, such as bulldozers or earth-movers, is used in the execution of conservation works at ancient sites.

There is an imperative requirement of creating and/or consolidating conditions for effective conservation of the cultural resources of the country. One has to move towards capacity building in institutions and empowerment of local conservation professionals. An emphasis on collaborative arrangements, particularly with educational institutions, environmental bodies and NGOs, and on training and awareness programmes is necessary. Institutions of culture at the national level – whether ASI, museums, archives or akademies – need to include heritage conservation as a priority area in their agenda.

**O**ne increasingly feels the need for collaboration between the ASI, the newly constituted National Culture Fund, and the national level voluntary organization INTACH. The National Culture Fund, launched in March 1997 at my initiative as Culture Secretary, has opened new and dynamic opportunities for embarking upon programmes involving participation of voluntary and government organizations in the national endeavour to protect and preserve India's cultural heritage. The Fund could become an important instrument to expand the areas of concern beyond the monuments protected by the ASI and the state departments of archaeology to

several historical sites and buildings facing decay for want of resources and professional care.

A unified approach is critical to avoid duplication of work or conflicting objectives, and may help assure possible donors as well as the public about the sincerity of action taken. It will also open areas of cooperation and participation by local community in the decision-making process as well as in implementation of programmes. Such an approach will help not merely in the utilization of scientific skills and technical knowledge, but combine them with local knowledge and traditions which form an integral part of India's intellectual legacy.

**T**he art objects of culturally rich developing countries were forcibly removed during the colonial era and today well-organized smuggling at international levels is rampant. In India, the Antiquities and Art Treasures Act, 1972, which came into force from 5 April 1976, seeks 'to prevent smuggling of, and fraudulent dealings in antiquities, and art treasures.' Under this Act, registration of antiquities as notified from time to time has become compulsory. Notwithstanding this legal framework, smuggling has assumed alarming proportions as art objects attract high prices in affluent western countries. The irony is that smugglers are sophisticated people with international networks, and they are often aided and abetted by auction houses.

A number of people in this country are still engaged in this illicit business. The Antiquities and Art Treasures Act, 1972 provides for an offence a penalty extending upto three years of imprisonment. This is not a sufficient deterrent. The International Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of

Cultural Property, adopted by the General Conference of UNESCO at its sixteenth session at Paris on 14 November 1970, is an important mechanism to prohibit and prevent illicit import, export and transfer of cultural properties. However, the real check to illicit international trade in antiques has necessarily to come at two levels – at the grassroots/institutional level, and through appropriate bilateral treaties between countries. The security of the antiques in the institutions where they may be located should be such as to pre-empt the possibility of any theft and, if there are appropriate bilateral agreements between countries, for the prompt return of the stolen property.

**T**he scale, diversity and historical depth of our heritage in terms of monuments, forms of art, music, dance and drama, as well manuscripts, require financial support of a massive nature, and an efficient, sensitive administrative infrastructure. Unfortunately, funding at such a level is not available, the administrative arrangements are inadequate, and there is an acute shortage of good culture managers in the country. State governments allocate meagre resources to cultural activities in their budgets. Even this amount faces drastic cuts whenever austerity measures are launched by the stage governments to mop up their deficits or to tide over their frequent financial crises.

The position in the Government of India too is not particularly attractive. The culture sector has not received adequate financial support under the five year plans. While the culture sector's allocation in respect of the first plan is not separately available, the expenditure was only Rs 3 crore, 7 crore, 12 crore, 28 crore, 115 crore, 451 crore and Rs 800 crore respectively under the 2nd, 3rd, 4th, 5th, 6th

7th and 8th five year plans. Although the standing committee of Parliament had recommended an allocation of one per cent of GDP on culture, the allocation of funds over the 8th plan – which was much more liberal than previous plans – has only been to the tune of 0.19 per cent of the total plan outlay of the Government of India. Notwithstanding the increasing importance of culture, both as a factor in development and in strengthening the country's special status in the world, one does not expect the 9th five year plan allocation to rise significantly. This is both due to financial constraints and a well-established practice in the Planning Commission to recommend marginal increases, except on programmes which come under political or security compulsions.

**T**he schemes to provide grant-in-aid to voluntary organisations of repute for the conservation and preservation of monuments, for documenting the performing and visual arts, for setting up museums at the district level, for establishing new regional centres of national academies, the National School of Drama, the zonal cultural centres, the Centre for Cultural Resources and Training, the state academies, for new libraries – all deserve substantial state support. Cultural education through the Centre for Cultural Resources and Training, as also through schools in general, requires special attention. In view of the magnitude of financial requirements, there is a need to look for external support. In this context, the National Cultural Fund becomes particularly relevant.

There is a need to strengthen the managerial capabilities of various organisations under the Department of Culture, such as the ASI, the National Archives, the National Research Laboratory for the Conservation of

Cultural Property, the Anthropological Survey of India, and the various library systems. The task of servicing heritage sites, archival materials, museums and art centres, libraries, and anthropological research have all suffered for want of organized services to man the cultural institutions.

As Culture Secretary, I had proposed to the Fifth Pay Commission the constitution of an Indian Archaeological Service, an Indian Anthropological Service and an Indian Library Service. The creation of these service structures could go a long way in boosting the morale of employees in these organizations, improving their career prospects, and serving the wider cause of augmenting efficiency in these fields of cultural pursuit. To attract talent from outside, a provision should be made for lateral entry and eventual absorption into these services, in addition to the regular annual recruitment of Grade 'A' culture managers through the Union Public Service Commission from among the young and bright graduates.

**T**he cultural manifestations of art and all other creative activities which improve the quality of life of man is what forms our heritage. Today, there is a great need for 'management' of culture in India, which is a developing country in the economic sense but highly developed in the cultural sense. We have to maintain our position in the global arena where we are looked up to by other nations as a country with a continuous cultural tradition over 5000 years.

Democracy and ecology are integral part of the Indian philosophy and culture. India has a tradition of democracy which can be traced to the small principedom of Vaishali in Buddha's time. Despite vicissitudes, it has survived and has become more vibrant during the last 50 years. Dur-

ing these five decades a new leadership has emerged comprising, happily, of many women at the grassroots level.

Ecology was a concern in the Vedas and Upanishads. I am not sure if the authors of the Vedas had a map of globe before them. Certainly, they did not have space satellites but they seem to have delved into those areas of cosmos and thought that nature is one for the whole world. It is true that modern democracy and ecology are post-Second World War concepts, but they will endure because the concern for ecology, the concern for human rights and government by consent of the people are basic concerns. At the same time, the role and responsibility of women as preservers and transmitters of tradition, cultural mores and all that comprises heritage will become more pronounced.

India's contribution to world culture, its rich bio-diversity and great plurality have generated awe, fascination and respect. In 1915, Ananda Kentish Coomaraswamy wrote: 'Each race contributes something essential to the world's civilization in the course of its own self expression... the essential contribution of India, is simply her Indianness; her great humiliation would be to substitute or to have substituted for this own character (*śvabhava*) a cosmopolitan veneer, for then indeed she must come before the world empty-handed.'

I have often wondered that modern India would be required to conserve in the new millennium many of the recent acquisitions, particularly those of the second half of the 20th century—computers, telephones, satellites, pop music, films, new literary trends, even nuclear weapons. But I am convinced that the challenge to conserve our cultural heritage would be more serious and urgent than any other and ever before.

# Towards an Indian charter

A. G. KRISHNA MENON

WHAT authenticity means to a society determines how it deals with the artifacts of its cultural heritage. Even though the dictionary provides a precise meaning of the word, in practice it varies from culture to culture and changes with time. It also varies depending upon whether one is thinking of ruins and monuments, or about buildings in use. The different meanings of authenticity have provided sufficient grist for several arguments, seminars and scholarly studies—particularly when conservation practices in previously marginalised local cultures became more widely known.

In India, for example, as the traditional building wisdom of the *sompuras* of Gujarat, the *asharis* of Kerala and *sthapatis* of Tamil Nadu becomes more widely known to the western-educated conservation community, many have begun to question the principles of their own practice.

While different cultures have different ways of dealing with their heritage, a widely-held definition of authenticity advocates the practice of non-intervention in the preservation of cultural artifacts. In fact, we can determine the difference between cultures on the basis of the degree of intervention that each culture thinks is necessary to protect its past. Some prefer minimum intervention, while others reconstruct substantial parts of buildings.

In India, the British colonial government introduced and established the principle of minimum intervention. This continues to be the guiding principle in the (official) practice of

conservation, though indigenous traditions contest this principle. However, actual intervention is determined both by the physical condition of the artifacts and the importance one places on the existing fabric. Even in England we witness an elasticity of definitions, from the extreme notion of non-intervention advocated by John Ruskin to an inevitably modified and sensible practice that nevertheless accepts the philosophical underpinnings of Ruskin's writings.

In the West, by 1931, the Athenes Charter even recommended the judicious use of modern materials, especially reinforced cement concrete, and thereby confirmed the practice that existed in several European countries at the time. Therefore, we can reasonably infer that before the Second World War, the conception of authenticity – and therefore the response of the conservation architect – varied and was generally mediated as much through practical necessities as through the ideological stance adopted by the profession in each society: there was no universal, or 'correct' definition to guide practice.

The extent of the destruction caused by the Second World War further eroded the boundaries between philosophical imperatives and practical necessities in Europe. It led to extreme decisions, such as the rebuilding of Rotterdam as a new city on the one hand, and the rebuilding of Warsaw's old town as a copy, as accurately as possible, of the destroyed original on the other. In each case, what was authentic about the destroyed city was perceived differently: one perceived it as lost and irretrievable; the other recognized the loss, but felt that its memory could be recreated for future generations.

I would like to clarify here, to those familiar with the passionate

debate between *scientific* and *stylistic* restoration a century ago, that I do not propose to go over familiar terrain. I will attempt instead to focus on the particular circumstances and the unique cultural conditions which sustain the possibilities of recreating authentic cultural artifacts in our society.

My position may appear to be close to the arguments employed by the advocates of *stylistic* restoration. I realize that considerable damage was wrought on valuable and irreplaceable buildings as a result of stylistic restoration at that time, so I will begin by clarifying my position. I agree that the replication of the 'old' in Warsaw is not, as Ruskin puts it, the 'real thing', that in building it anew it had indeed become something else, a copy, a counterfeit, and so had lost its authenticity in the literal sense of the word. Who can disagree with the forceful condemnation of replications by Ruskin?<sup>1</sup>

While I do not take issue with Ruskin, I would nevertheless distinguish between the literal and the broader definitions of authenticity and the meaning such broader definitions have in the lives of the people who relate to the cultural artifact. The reconstructed town of old Warsaw is certainly a 'lie' as Ruskin would have put it, but the positive emotions it evoked in its reconstruction, and continues to evoke in subsequent generations in that society, are equally palpable and real, and provide enough justification to view the exercise in a different light. Thus, given the circumstances, a 'lie' can have redemptive qualifications in the field of conservation, even if it is untenable on historical or philosophic grounds.

1. John Ruskin, *Seven Lamps of Architecture*, 1849.

To understand the nature of such redemptive qualifications, it may be instructive to examine Alois Riegl's definition of *age-value* to interpret works of the past. Though Riegl is quintessentially 'modern' and 'European' in his sensibility, he has drawn an useful distinction between the modern and pre-modern view of age-value. He defines age-value as that which is 'rooted purely in its value as memory... (which) springs from our appreciation of the time which has elapsed since (the work) was made and which has burdened it with traces of age... (The) emotional effect depends on neither scholarly knowledge nor historical education.'

To clarify, he juxtaposes this quality with 'newness' which he says must recall '...earlier works as little as possible.' To Riegl, who was attempting to define the characteristics of modernism during the early part of this century in Vienna, the two ideas were complementary and dependent on each other.<sup>2</sup>

It is clear to us today that the pairing of the two terms by Riegl belongs to a specifically modern sensibility, as are the views of Ruskin, William Morris, *et al.*, who defined the English conservation sensibility. It is this sensibility that permeates the modern meaning of 'authenticity' in UK, Europe and the various charters which the European nations promulgated as 'universal' beliefs. This sensibility was passed on to us by the colonial government, which the formal/modern profession of conservation accepted as gospel. We punctiliously refer to this sensibility to authenticate conservation practice in India in order to 'catch up with the West'.

2. For a discussion on this subject, see Alan Colquhoun, *Modernity and the Classical Tradition, Architectural Essays 1980-1987*. The MIT Press, Cambridge, Mass, 1991, pp. 213-221.

The past, according to Riegl, is valued in the European cultures for its 'pastness', a concept which would be difficult to translate in the Indian context. It is based on the concept of the linearity of time – the 'arrow of time'. To the modern Indian architect, for example, the past is viewed differently, with a contemporary stamp as it were. The (architectural) past provides models for the development of a contemporary Indian architecture because the past represents *timeless* architectural values and is distinct from the term 'pastness'. It represents a perception of history and the past which cannot be attributed to the arrow of time, and therefore, in cultural terms, the perception of elements of the past as timeless represents a value different to the one that ascribes the quality of pastness to it.

**R**iegl's concept of age-value also does not take into account another distinctive characteristic of the Indian heritage: the organic relationship between monuments and the societies that produced them, though he does accept that in pre-modern societies (or in Europe before 1800) such a relationship may have existed. Modern Europe has lost or discarded this organic relationship in the process of modernisation. Hence it is able to view its past with an emotional distance that pre-modern societies would find difficult.

As a modernising society – pre-modern in sociological terms – our society does not (could not, according to Riegl) value the past for its pastness. Both modern and traditional architects in India, in fact, explore/examine/excavate the past in order to develop a 'normative' (in response to the consequences of modernization) contemporary architecture which would perhaps display 'timeless architectural values'. There is an

organic relation between the past and present not available in Riegl's definition of pastness or age-value. The *sompuras*, the *asharis* and the *sthapatis* are products of and subscribe to this organic relationship between the past and its contemporary meaning to the people to whom it belongs.

**I**n the Indian context, anyone working on the historic cores of cities invariably takes into account the existence of the organic relationship between monuments and the societies that produced them. Because of this relationship, heritage in India has a normative contemporary relevance, a perspective which is different from the European (Riegl's) definition of age-value. The difference between the European and Indian perspectives on the past is also reflected in the difference between the official/legal and the traditional perceptions of the people and the craftsmen within India. Each holds different views on what constitutes authenticity in the architectural heritage, and Riegl provides the key to understanding the differences. This dichotomy is becoming increasingly apparent in seminars and practice in the field, and must be addressed if we are to evolve a more appropriate conservation practice in India.

The formal practice of conservation in India is guided by attitudes nurtured over the past century, at least since the establishment of the Archaeological Survey of India (ASI) in 1862. It was re-organised and given legal status by Lord Curzon in 1904 and it matured under the direction of eminent British archaeologists such as John Marshall (1902-1928) and Mortimer Wheeler (1944-48) who headed the organization. Marshall wrote the Conservation Manual in 1923 which remains the basic text guiding conservation work in India. This manual was updated for the

Indian National Trust for Art and Cultural Heritage (INTACH) in 1989 by another eminent British conservation authority, Bernard Feilden.<sup>3</sup>

Wheeler, in his four eventful years in India, ushered in the current phase of archaeology and systematic excavation, and trained a new generation of Indian archaeologists who maintain the protected monuments in the spirit he inculcated in them. This alignment with British practice has been further reinforced during the last ten years through the agency of the Charles Wallace Trust Scholarship Fund to train Indian conservationists at the Institute of Advanced Architectural Studies, University of York, UK. The economic problems facing British universities has also meant that more British institutions are actively looking for opportunities to encourage Indian students to study in the UK. Undoubtedly, this will reinforce the trend of alignment with British practice. In addition to the 'aligned' staff of ASI, there are now over 30 'York scholars' in India who propagate a very British perspective on conservation.

**T**oday the ASI protects over 5000 monuments of national importance, while its counterparts in the various states look after another 4000 monuments. The small number of protected monuments in an archaeologically rich country like India reveals the astonishingly limited nature of ASI's perception of the cultural heritage which it is charged to protect. This can only partially be explained by the inadequate financial resources at its command because, I suggest, it is the ideological roots of the profession in India that is the problem.

3. Bernard M. Feilden, *Guidelines for Conservation: A Technical Manual*. The Indian National Trust for Art and Cultural Heritage, New Delhi, 1989.

First, the protection of only 9000 monuments in a country of the size and antiquity of India obviously covers only a fraction of the extant material. One gets an idea of the scale of inadequacy of these numbers when one realises that in Britain there are 30,000 Grade-I monuments receiving positive attention in one form or another out of 500,000 which are listed. Since the British colonial government established the criteria for the selection of buildings to be protected – which the ASI continues to follow – one can only speculate if this selectivity in the protection of the monuments in India did not perhaps reflect the sheer exasperation of the colonial mind when confronted by the problem of managing a prolific but alien culture. Entire categories of the building heritage, though assiduously protected in Britain, were left out of the purview of conservation in India. What were defined as authentic examples of the cultural heritage in India precluded everything but the most exemplary buildings and archaeological sites.

That the post-independence ASI continues to follow such a limited and restrictive definition of authenticity is indeed strange and worth examining. The ASI currently operates under The Ancient Monuments and Archaeological Sites and Remains Act of 1958, which is in fact only a slightly revised version of Lord Curzon's pioneering initiative, The Ancient Monuments Preservation Act of 1904. Thus, while in Britain the objectives of conservation, and policies to put them into effect, have evolved over the years (witness the changes in the town planning legislation to accommodate the imperatives historic towns and precincts),<sup>4</sup> laws and practice of conservation in India have ossified into a

mindset established in 1904. Clearly, there is a strong case to re-examine conservation principles and broaden the definition of what constitutes authenticity in the field of architectural heritage. Any such exercise should accommodate the indigenous traditions of conservation and address the problem of protecting the less than exemplary monuments which are currently outside the purview of ASI.

Second, the focus on monuments alone is inadequate and provides a misleading definition of cultural heritage. A good example of looking beyond monuments is the Burra Charter adopted by the Australian ICOMOS. The Burra Charter defines *place* as a 'site, area, building or other work, group of buildings or other works together with pertinent contents and surroundings,' and *conservation* to mean 'all the processes of looking after a *place* so as to retain its *cultural significance*' and in addition to regular *maintenance* the work of conservation may, 'according to circumstance, include *preservation, restoration, reconstruction and adaptation* and will be commonly a combination of more than one of these.'

The charter, however, excludes the practice of either recreation or conjectural reconstruction, but more on that later. For the present it is only necessary to recognize the existence of broader perceptions of what is authentic about the past than those so assiduously cultivated by the ASI.<sup>5</sup>

Third, the situation reveals a poor appreciation of the conservation movement among intellectuals, administrators, technicians on the one hand and the people at large on the

other.<sup>6</sup> We in India need to evolve our own philosophical approach which should take into account both the meaning of authenticity inherited from our exposure to the West and the indigenous traditions which include the role of craftsmen who constitute the *living* heritage in our contemporary society.

It is the availability of craftsmen – *authentic* by any definition – in the present time in our society which defines the specificity of our contemporary cultural condition and should distinguish conservation practices in India from the inherited European terms of reference. The fields of dance and music in India have nurtured the continuity of these traditions and have consequently flourished in our times: likewise we need to promote and establish the continuity of the craft tradition of building in our contemporary society before it is lost to future generations. To pass on to the next generation what we possess in ours is the fundamental premise of conservation. This is unlikely to happen unless we re-examine our current conservation precepts.

This examination should take into account the *de facto* changes that are taking place in the conservation movement, even though the *de jure* situation remains fossilised in colonial imperatives and practices. A major catalyst for change was the

among other things. (ii) The *Florence Charter* of 1987 on historic gardens and landscapes. (iii) The *Washington Charter* of 1987 on historic areas and towns filling in an important gap in the Venice charter. (iv) The *Lausanne Charter* of 1990 for archaeological heritage.

India is a signatory to these charters as a member of UNESCO, but there is no evidence of the government taking any follow-up action in consequence of accepting these charters in its working methods.

6. Bernard M. Feilden, 'Is Conservation of Cultural Heritage Relevant to South Asia?' *The Journal of South Asian Studies* 9, 1993.

5. The International Council for Monuments and Sites (ICOMOS) has promulgated four charters: (i) The *Venice Charter* of 1964/66 which emphasises the need for conserving authenticity and thorough documentation

4. For a synoptic review see the HMSO booklet on Planning, 1992.

establishment of INTACH in 1984. Its work in the area of architectural heritage attempted to bridge the gap between the work of the ASI on the one hand, and the town planning departments of the various state governments on the other. Both agencies deal with the architectural heritage, but seldom with a common purpose: INTACH attempted to define the common purpose.

Initially, INTACH adopted the ideology of international orthodoxy. This was inevitable considering that the direction of its technical work was firmly in the Marshall/Wheeler tradition<sup>7</sup> and its own *Guidelines for Conservation* was written by the eminent British conservation architect, Bernard Feilden<sup>8</sup>. As it turned out, these vestiges of international conservation orthodoxy were not critical in the works initiated by INTACH, because most of the conservation work was carried out by professional architects who had little previous experience in the field and thus were often able to see afresh the realities they confronted in their projects.<sup>9</sup>

These realities began to define the specificities of the Indian context and is the source of the arguments I am constructing in this paper. India has perhaps the oldest continuous civilization and the evidence of its past

7. The technical direction was provided by B.K. Thapar who was a student of Mortimer Wheeler and a former Director General of the ASI. It is interesting to note that B.K. Thapar admitted during the course of many discussions that his experience at INTACH had altered his earlier perspective and generously encouraged my apostasy.

8. Even Bernard Feilden recognized the particularities of the Indian circumstance and hoped that in time, India would define its own conservation philosophy.

9. The practice of employing architects to undertake INTACH's conservation work revealed an interesting lacuna in the ASI's work. Archaeologists working for the ASI have no formal architectural training; they are typically civil engineers and historians. Though

evokes not only wonder, but empathy and emotional involvement as well. It is also a diverse culture of several religious, historical antecedents and aspirations, all coexisting in discrete geographical regions: what one policy of conserving the age-value of the architectural heritage can suffice to deal with such diversity? Clearly, a common attitude and objectivity are difficult to achieve in the pursuit of conservation in India.

The work of the ASI requires the isolation of buildings from the use for which they were intended for their protection. While this may be valid for buildings of the highest importance, it cannot be advocated for the majority of the extant (and non-protected) buildings and monuments of cultural value, particularly examples of vernacular architecture. Such buildings continue to be in use, and indeed derive meaning from such use.<sup>10</sup>

What is the meaning of authenticity to the people who are using the architectural heritage? Is it the same as the one held by archaeologists, historians and other arbiters of cultural heritage? This question was brought home to me while I was working on an exquisite ensemble of old wooden houses belonging to the Bohra community in Ujjain. In our survey we had noted with dismay the process of attrition beginning to take hold in this neighbourhood; these wooden houses were being replaced with non-descript

familiar with architectural history and traditional building practices, they have little understanding of architectural methods and devices. The situation in Britain, it must be noted, is different, and the specially trained architect is an important member of the conservation team, often in a pivotal decision-making capacity.

10. The ASI faced an interesting problem in restoring and consolidating the Jagannath Temple in Puri. The manner in which it negotiated the particular problem of dealing with this important religious building in daily use would make an interesting case study.

'modern' houses. We recognized the need to stem the tide and worked out a complex strategy for *in-situ* upgradation, economic incentives and subsidies and professional assistance.

The residents, however, were not persuaded to adopt our proposal because, as they pragmatically pointed out, the antique dealers in Bombay who cannibalized the building into smaller artifacts were willing to offer a substantial fortune – obviously far more attractive than our modest package – for their house. All things considered, they preferred to accept the windfall. Our subsequent proposal, that the government should acquire one or two buildings as models for posterity, too did not materialise because such 'cultural' expenses were placed low in their priority, and their meager budget addressed the larger concern to provide minimum essential services.

In what manner could we address the issue of authenticity and the conservation of the Bohra houses in Ujjain? Of course, one could shrug off the question and concentrate on preserving just the 9000 odd 'official' monuments listed by the government. Such indifference would, however, inevitably lead to the loss of a large part of our heritage through attrition. Can we consider the unthinkable – a strategy to reuse the cannibalised Bohra house? Many consider cannibalising a historic artifact objectionable in the deepest sense, but turn a blind eye to the process of attrition due to market forces. The lesson to be learnt from this experience is that future policies need to be flexible and even consider the protection of cannibalised architectural elements as a possible conservation option. We have to face the problem head-on and choose strategies to suit the circumstance.

Any strategy to conserve the architectural heritage in the present circumstance will have to contend with the imperatives of development and social change.<sup>11</sup> The problem with the various international charters is that they presume the availability of a *preservation option* while dealing with architectural heritage in India. The stark reality in most cases is that the preservation option is irrelevant to the future aspirations of the people to whom the heritage belongs. The concern for preserving the 'golden stain of time' would appear to be a cruel irony to those desperately seeking change and the basic necessities of life.

Let us, therefore, look at *change* as a strategic option to achieve the objectives of architectural conservation. But what kind of change? If we must consider change as an option to *conserve* the architectural heritage, we come up against Riegl's pairing of newness and age-value in his definition of architectural heritage. We must recall that Riegl was attempting to define 'modernism', and in the process clarified the European meaning of authenticity and consequently the rationale for conservation in Europe, which we have come to accept as universal—at least, officially—in practice.

This, as I have tried to show, is at odds with the cultural stance of the people and the ground realities in India. I, therefore, believe that in India age-value must have a contemporary stamp and not be distinct from newness as suggested by Riegl. To achieve this I suggest that we must enlist the various crafts and traditions of the traditional craftsmen to achieve this objective. The 'new' that they build, reconstruct or add onto, must have the stamp of the authentic tradi-

tion the communities of craftsman have nurtured through generations.

I have discussed earlier the need to re-prioritise the objective of conservation in India by focusing on what is *becoming* of our architectural heritage rather than on *what it was*.<sup>12</sup> That was nearly nine years ago. In the meantime I have tested my ideas at seminars and in the field. I cannot claim to have put my ideas across as effectively as I would have wanted to, and it is possible that much of the resistance I have faced could be on that account. Nevertheless, the message I carry away from those dialogues is this: 'We broadly agree with your argument, but....'

The 'but' is seldom cogently explained except in terms of not seeing any problem with the prevailing ideology or practice of conservation as advocated by the international charters. By and large, the people I spoke to did not wish to be confused with the facts of our cultural circumstances, but preferred, instead, to operate within the certainties of the internationally validated *status quo*. Even INTACH, which pioneered so much work in the past, and whom I have attempted to persuade to examine the necessity for an Indian charter for conservation, remains strangely reluctant. Once again, I come away with the message I have received elsewhere: '...it is difficult enough trying to keep the ideological boat on an even keel under the present circumstances, don't try and rock it by asking provocative questions to which we have no answers.'

The Indian charter for conservation, when formulated, will inevitably have to address these provocative questions. To begin with it will have

to distinguish between the exemplary monuments which are currently accorded legal protection and the other, less-than-exemplary monuments and buildings or groups of buildings which abound in our country. The list of exemplary monuments should, of course, be increased<sup>13</sup> and they too should be protected by the ASI. They should follow the standards and practices enunciated in the international charters. The work on the second category of unprotected buildings should, however, follow new imperatives to be set out in an Indian charter of conservation and this will have to allow change, consider conjectural additions and alterations, accept replacement and even allow new buildings using traditional craftsmen, materials and techniques. The work of traditional craftsmen will have to be encouraged, promoted and valued as constituting an authentic tradition to be conserved for future generations. They could even offer a viable alternative to contemporary building systems.

To encourage — and thereby conserve — the practice of the traditional mason or sculptor raises the question of which form of authenticity this practice would seek to conserve: the historic building or the historic *way* of building. The persistence of the historic way of building in India is a precious characteristic of cultural continuity in our contemporary society. We need to recognize its value and not continue to privilege the historic building over the historic ways of building in our conservation policies. This will be the task of an Indian charter of conservation.

13. A study undertaken to conserve the old city of Bhubaneswar (*Ekamra Kshetra*) by INTACH in 1989 identified 48 additional Grade I monuments and 117 Grade II and Grade III monuments which were not protected by either the state or central agencies.

# A legal approach

VRINDA GROVER

ON *Baisakhi* this year, I went to Amritsar for a family reunion. Memories were relived and old haunts visited but on Lawrence Road, where the family had lived since Partition, *Ghadiwalli Kothi* (mansion with a clock) had vanished. Vanished without a trace. Even an old rickshaw puller rued the kothi's absence. 'It always gave the correct time,' he said. References, signs, memories – both personal and historical – these are what bind people to their city. Bonds that are shared by its inhabitants.

Imagine returning to Delhi after 10 years to find that the ruins of a dam built during the reign of Mohammad bin Tughlaq near your house has been replaced by a school of vocational studies, or an old city wall demolished to facilitate the flow of traffic. Major historical structures like the Red Fort, Qutab Minar or the Humayun's Tomb would, of course, remain but several smaller 'insignificant' structures are more likely to disappear, just like the Ghadiwalli Kothi in Amritsar. Such a possibility is real for Delhi and several other Indian cities, with the exception of Mumbai and Hyderabad.

There is today an increasing awareness about the monumental heritage of India and concern for its preservation is frequently voiced in the media. The monuments of national or regional importance are generally protected by statutes, viz. The Ancient and Historical Monuments and Archaeological Sites and Remains Act,

1958, and corresponding state legislations. The mandate of the Archaeological Survey of India and the state archaeology departments is to protect and maintain these monuments. Undoubtedly, those entrusted with this task need to do much more.

What is, however, of deep concern is the fate of the thousands of unprotected buildings, towers, mosques, shrines, bungalows, *havelis*, churches and clock towers, ponds, rock formations, even old trees, which fall outside the purview of any such statute. There is no legal regime for the protection of these cultural and natural properties. There is an urgent need to intervene in such situations since it is this heritage that we are rapidly losing. It is these buildings and precincts, artifacts and ecological features, which give each city its distinct character and identity.

Heritage regulations preserve not only structures but also relationships between people and their city. No matter for how long you are away from Mumbai, on your return you will find intact the villas of the 19th century. The dockyards, fountains, churches, mansions, schools and college buildings would still be standing in the nerve centre of India's business capital. Similarly, Hyderabad is unlikely to lose its historic character and the mosques, forts, towers, temples, gardens and rocks will make a transition into the next century. However, the same optimism cannot be expressed for the buildings and structures of India's capital, Delhi.

Mumbai has taken the lead in preserving its unique character and culture embodied in its built heritage. In February 1991, the Municipal Corporation of Greater Mumbai, the relevant planning authority, gazetted the heritage regulations for inviting public objections and suggestions as Development Control Regulation No. 67. These supplement the development control regulations under the Maharashtra Regional and Town Planning Act, 1966. In April 1995, these were sanctioned by the government of Maharashtra. A few days later, a list of heritage buildings and precincts was issued. The regulations thus framed and in force since February 1991, now control all development, redevelopment, repairs and usage of all structures enumerated in the list.

**T**hese heritage regulations were introduced to preserve Mumbai's urban fabric in the face of rapid economic changes and a rising demographic graph. Taking cue from Mumbai, the Hyderabad Urban Development Authority, in December 1995, issued regulations for the conservation of heritage buildings and precincts (rocks) in Hyderabad city. These regulations are in addition to the existing Hyderabad Urban Development Authority Zoning Regulation 1981, under Section 59 of the Andhra Pradesh Urban Areas (Development) Act 1975. In February 1997, a list of 150 heritage building and 9 heritage precincts (rock formations) was published for public notice.

Over three years ago, in April 1995, the Ministry of Environment and Forests prepared draft regulations for the conservation of heritage buildings, heritage precincts and natural features within municipal areas or other legally designated urban areas. A copy of these comprehensive draft

regulations was sent by the Government of India to the chief secretary of every state and union territory. Unfortunately, it failed to evoke much response from the concerned governments.

**W**hat is it that these heritage regulations seek to protect for posterity? Within the purview of these heritage regulations would fall such buildings, artifacts, structure, areas and precincts which have historical, aesthetic, architectural and cultural significance, and those natural features which have environmental significance. A list of such heritage properties is prepared by the planning authority and confirmed after considering the suggestions and objections of the public. These regulations would thereafter control all development, redevelopment or engineering operations or additions, alterations, repairs, renovation or demolition of the listed building or listed precincts or listed natural features.

The decision-making power under the regulations vests in the municipal commissioner, who in turn would act in consultation with and on the advice of the Heritage Conservation Committee. The scheme of heritage regulations envisages active citizens' participation – structural engineers, conservation architects, city historians, environmentalists, eminent citizens, nominees of the Ministry of Environment and Forests and officers of the state government and municipal corporation.

This heritage conservation committee is expected to play a pivotal role in enforcing the regulations and advise the municipal commissioner in all cases, as also prepare a supplementary list of buildings, precincts or natural features to which the operation of these regulations would extend. This committee would also offer expertise in conservation and

design elements and in the maintenance of the listed structures.

The heritage conservation committee, using the yardstick of significance, merit and excellence of the structure would grade all heritage buildings and precincts enumerated in the list. Listing of a building would not obstruct a change of ownership or usage provided such a usage is in harmony with its cultural value. The grading of buildings would provide the basic guidelines for grants and development permissions.

**H**eritage Grade I comprises building and precincts of national or historic importance, embodying excellence in architectural style, design, technology and material usage. These are prime landmarks of the city. In Grade I structures no external or internal change is permitted. Heritage Grade II (A&B) would comprise of buildings and precincts of regional or local importance possessing special architectural or aesthetic merit or cultural or historical significance, though of a scale lower than Grade I. These are the local landmarks of a city. Such structures deserve intelligent conservation. Under Grade II(A) internal changes and adaptive reuse and external change would be allowed so long as the special features of the property is retained. Under Grade II(B), in addition to the above, extension of the building may also be allowed so long as it does not detract from the heritage value of the building.

Heritage Grade III comprises building and precincts of importance to townscape. They are of architectural, aesthetic archaeological significance. They represent the distinctive character or lifestyle of a particular community or region. Structures under this grade deserve intelligent conservation and protection of unique features. For such buildings external

and internal changes, as well as adaptive reuse would by and large be allowed, and an extension of the same plot would also be permitted. All these development permissions would be granted by the municipal commissioner on the advice of the heritage conservation committee.

For these regulations to be effective it is necessary that urban development authorities, while planning cities and towns, display sensitivity to the heritage value of buildings and areas dotting the city. The draft heritage regulations of the Ministry of Environment and Forests require the master plan to be so prepared that no development activity which detracts or adversely affects any listed building, precinct or natural feature is allowed. In any construction of new roads or road widening works, care must be taken that listed structures are not affected. Similarly, all development within the heritage precinct should be in accordance with the special regulations framed for each listed precinct.

**T**hese heritage regulations require that while planning for development the concerned authority should accord primacy to preserving the heritage character of the city. Even while installing hoardings and signboards, it should be ensured that the skyline of heritage buildings is maintained and not overshadowed. If our urban heritage is to be saved, planning and urban development authorities must reorient themselves and hold a serious dialogue with heritage conservationists. A fresh approach must be adopted and development and heritage conservation must no longer be viewed as antithetical to each other.

It would be futile to stress the need for conservation and preservation of properties located in the metropolitan and other major cities, where

land prices have spiraled in the last decade, unless these heritage regulations are backed by sound fiscal policies. To make heritage regulations vibrant and viable, powerful incentives have been offered. It is critical for preservation that the owner of a heritage property views his building as an asset rather than a millstone round his neck.

**O**ne of the incentives provided is in the form of a transferable development right to the owner of a listed property if he is deprived of any unconsumed floor space index on account of the heritage regulation. A development right certificate is issued to the owner to enable him to utilize the development potential in another plot of land. The holder of a development rights certificate may transfer it to another person. This development certificate, issued by the municipal commissioner, operates as a negotiable instrument.

For instance, in Mumbai, while the transferable development right for normal development plan reservation cannot be utilized in the island city of Mumbai, heritage transferable development right is allowed to be utilized in the same ward from which it originates, even within the island city. Another powerful incentive offered by the regulations is to allow the owner of a heritage building to use a portion of his building for commercial office space. The heritage conservation committee would also permit adaptive reuse of heritage property, which would enhance both the commercial and heritage value of the property.

On the advice of the heritage conservation committee, the municipal commissioner may also disburse funds for repair and maintenance to owners of listed properties from the restoration fund. Despite astronomical property prices and a powerful

builders lobby, this experiment has already proved highly successful in Mumbai. The Mumbai experience has been most encouraging and this scheme enjoys the support of its citizens.

According to most analysts, by the turn of the millennium, tourism is slated to be a major revenue generating industry. There is speculation that if India takes the right steps to promote tourism, the chronic problems of unemployment and paucity of foreign exchange could to some extent be resolved. While the ancient pluralistic civilization and spiritual mysticism of India continues to attract tourists, this must be coupled by sincere and rigorous efforts to provide visitor-friendly environs in cities such as Delhi which is an important destination on the tourist map. I remember my grandfather often quoting the lines of a famous poet, '*kaun jaey Zauk par Dilli ki galiyan chod ke.*' Obviously there was a charm, magic and nostalgia about Delhi that he often referred to. Heritage regulations are a unique mechanism to recapture some of that magic.

**T**he Indian National Trust for Art and Cultural Heritage (INTACH), committed to its charter of preservation and conservation of the cultural and natural heritage of India, has actively campaigned for the introduction of heritage regulations drafted by the Ministry of Environment and Forests. A dialogue in this respect has been initiated with the concerned authorities in Delhi, Chennai, Cochin and Thiruvananthapuram. Heritage regulations cannot be the exclusive concern of conservation organizations. If the remnants of peoples' aspirations, struggles and achievements are to be saved, many others must join hands.

A city that seeks to forget its past and erase its present is doomed to wander forever in search of its soul.

# Institutional efforts

M VELAYUDHAN NAIR

LITTLE is known about the status of conservation of cultural property in pre-British India. From available records it has been established that the earliest efforts started in the latter half of the 19th century and were limited to the structural repair of monuments. These efforts by the then rulers utilised available skills, and often ignored the principles of retaining the historical or archaeological value of the site. With the establishment of the Archaeological Survey of India (ASI) in 1861, modern aims and methods of conservation came into existence. This in turn led to the formulation of a conservation policy by the government.

Chemical conservation in India can be traced back to the attempts by Griffiths to apply varnish on the wall paintings of Ajanta in 1872. This was done to protect the paintings from damp and also to brighten them. Unfortunately, Griffiths was not a trained conservator and the cultural wealth in India suffered heavily as the paintings crumbled along with the varnish within a period of five years. This disaster was recorded by Maindron in 1884. It highlighted the need for

involving the scientific community in the field of conservation and for recognising conservation as a scientific profession involving research and training.

The incident also opened the eyes of Lord Curzon who became Governor General of India. In his address to the Asiatic Society of West Bengal on 6 February 1900, he declared, 'Epigraphy should not be set behind research any more than research should be set behind conservation. It is, in my judgment, equally our duty to dig and discover, to classify, reproduce and describe to copy and decipher and to cherish and conserve.' This understanding about the conservation of cultural property in India led to the formation of a science branch of the ASI. Though it was slow in growing, the formation of new central and state governments after Independence gave it some momentum.

At the national level, the Department of Culture, Ministry of Human Resource Development is the nodal agency directly responsible for the activities related to the conservation of cultural property. There are several institutions under its control through

which policies are implemented. The most high-profile among them is the Archaeological Survey of India. The ASI can boast of having the oldest and biggest set up in the field of conservation. The conservation branch of the Survey has the infrastructure for structural conservation of monuments while the chemical branch takes care of the scientific preservation of monuments, antiques and works of art.

**T**he first chemical laboratory of the Survey was established in Calcutta before Independence, headed by a chemist trained at the British Museum Laboratory under the orders of the Government of India. Currently, the headquarters of the science branch are in Dehra Dun with a well equipped central laboratory and several other zonal laboratories. The mandate of the Archaeological Survey is to preserve the cultural wealth of the country in the form of monuments declared protected by the government, museum objects in the site museums, treatment of antiques and the scientific study of objects during and after excavation and so on, in addition to research and training.

It is important to note that the first training programme for conservation in India was organised in 1940 when Sir Mortimer Wheeler was the Director General of the ASI. He established the Taxila School of Archaeology, and the field laboratory attached to the school trained young conservators in cleaning and consolidation of antiques. Presently the science branch organises a number of training programmes benefiting personnel who are in service.

A landmark in the history of conservation in India was the establishment of the National Research Laboratory for Conservation (NRLC) of cultural property in 1976. The laboratory was set up for fulfilling the fol-

lowing objectives: (a) Research for the development of better methods of conservation; (b) Technical study of the art and archaeological materials; (c) Technical assistance to museums, archaeological departments and other institutions; (d) Training; (e) Publication and documentation; and (f) International liaison.

Over the years the laboratory has grown into a multi-disciplinary research centre with generous support from UNDP and UNESCO. The laboratory has contributed commendably to the improvement in existing methods of conservation to suit Indian conditions, development of new methods, technical studies of ancient materials to throw light on ancient Indian technology, organising regular and specialised programmes to benefit conservators, archaeologists and museum personnel. The laboratory has successfully executed several conservation projects in India and neighbouring countries.

**T**he Central Conservation Laboratory attached to the National Museum is a model museum laboratory with sophisticated equipment and trained manpower located in the capital. It is the centre for major activities, both national and international, in the field of museum conservation. In addition to successfully completing a number of conservation projects, the laboratory organises short-term programmes for conservation professionals.

The establishment of the National Museum Institute of Art, History, Museumology and Conservation (a deemed university) has added to the significance of the National Museum. The institute offers both a master's and doctoral programme in conservation. Within a short span of time the institute has attracted attention with the conservation com-

munity welcoming qualified conservators and scientists from the institute.

**T**he National Archives of India, Delhi; The National Museum of Modern Art, Delhi; Indian Museum, Calcutta; Salar Jung Museum, Hyderabad and several others have well equipped conservation laboratories. The National Archives of India is the central place for the scientific study of manuscripts and other archival materials. It also organises training programmes benefiting professional conservators. Since the workloads in other National Museum laboratories are heavy, they do not generally involve themselves in activities other than the actual conservation of their own museum collections.

The Department of Science and Technology, GOI though not directly involved in conservation or conservation research has a major role in inducing the scientists of various institutions to take up projects related to conservation. The department has constituted a committee called Application of Science and Technology in Conservation of Cultural Property (ASTECH), with eminent scientists drawn from universities and important research centres in India. The committee advises on funding specific projects in specialised areas of conservation which otherwise would be neglected.

The successful completion of a project on microbial deterioration of stone monuments by the National Research Laboratory for conservation of cultural property is a good example of such efforts. Further, the department has succeeded in bringing together scientists working in universities, Indian Institutes of Technology, Regional Research Laboratories of the CSIR and so on, with conservation professionals and scientists. They have discussed their problems and had

effective interactions to jointly tackle some complicated research problems in conservation. The 1993 seminar organised by the Department of Science and Technology at the National Research Laboratory for conservation of wall paintings in India marked the beginning of such efforts.

**S**everal other departments, including the Department of Atomic Energy, have shown interest in the problems related to conservation. Homi Bhabha, for instance, was interested in the neutron activation analysis of ancient materials. This resulted in the thermoluminescence dating of pottery by the Homi Bhabha Atomic Research Centre, and a seminar on archaeological dating and thermoluminescence organised at Kalpakkam, Chennai.

The Oil and Natural Gas Commission, Geological Survey of India, National Geophysical Research Institute, and the National Institute of Oceanography too have encouraged projects in conservation, especially those relating to underwater excavations. Further, institutions like the Defence Research Laboratory, Hyderabad or the Electronic Research Corporation of India, Hyderabad have cooperated with the Madras Government Museum in fingerprinting of ancient South Indian bronzes, using the latest available techniques such as X-ray fluorescence, holography, radiography and so on.

The state of affairs in the field of conservation of cultural property under the various state governments in India is, however, not encouraging. Not all the states have facilities for conservation and even in places where laboratories exist, they are neither well equipped nor have trained manpower. Despite these constraints, some state laboratories have done commendable work, not only in executing conservation projects, but also

by contributing in areas of conservation research.

In this context, the work of the Madras Government Museum Laboratory is noteworthy. The laboratory attained recognition for its work on electrolytic restoration of bronzes as early as 1940 under the guidance of F.H. Gravely, who headed the laboratory. During this period a new building was constructed inside the museum premises exclusively for the laboratory. This laboratory and the electrochemical treatment it developed attracted the attention of Colin G. Fink at the Metropolitan Museum of Art who preferred this treatment for bronzes and made modifications in equipment to suit large bronzes. But this prestigious laboratory continues to be severely constrained, with the same staff strength as it had in 1940.

**A** state laboratory for conservation was set up in Kerala in 1979. The state administration decided on a centralised well-equipped unit, rather than small units in each museum or department. The laboratory has successfully completed several projects, not only for government institutions but also for temples, churches and individuals. It has cooperated with universities and national institutions like the CSIR laboratories and the ISRO laboratories at Thiruvananthapuram to undertake research programmes on problems related to the preservation of palm leaves, metal artifacts and photochemical deterioration.

Several states like Punjab, Assam, Orissa, Madhya Pradesh, Haryana, West Bengal, Uttar Pradesh and Andhra Pradesh have moderate facilities for preservation of their cultural wealth. But it is painful to note that some important states like Karnataka and Maharashtra have few facilities of their own. However, it is

some satisfaction that most state administrations today are aware of the need for conserving the antiques and art objects under their control. They are able to do so with the help of national institutions like the National Research Laboratory for Conservation and the Indian National Trust for Art and Cultural Heritage (INTACH) laboratories. At a meeting of the state directors and administrators organised in 1993 at NRLC Lucknow, it was resolved that there should be state level laboratories for conservation in all the states. The recommendation is yet to materialise.

It is a fundamental responsibility of the government to preserve the rich cultural heritage for posterity – be it monuments, museum objects, art treasure or manuscripts. It is difficult to answer the fundamental question of whether our administration has succeeded in fulfilling this obligation. Even if it is assumed that all protected monuments, materials in the museums, the records in our archives, books in the library, and paintings in art galleries are safe and properly looked after by the administration, what is happening to the cultural wealth not protected by any organisation, or in the hands of private individuals, remains an important question.

**T**he foremost challenge before the government is to provide protection to the neglected treasures. To date, the government does not have a clear idea as to the size of the problem. For example, a single *grantha bhandar* may have thousands of manuscripts and a single temple may have hundreds of sculptures – the list is endless. One has to review existing facilities or the allocation of funds given the scale of the problem. It is evident that the funds allocated for conservation are inadequate. The departments

entrusted with the task do not receive proportionate increases, compared to other departments, whether at the Centre or in the states. At the same time, the administration is under pressure to take on the additional burden of protecting more monuments and acquiring more objects for their museums or galleries. In such a situation, the neglect is likely to continue.

In 1993, the Government of India appointed a committee of experts under the Chairmanship of Saroj Ghosh to review the situation and for coordinating existing facilities such that the neglected areas would get some attention. One of the main proposals considered by the committee was for an extension of the facilities of the National Research Laboratory to all the states in the form of regional laboratories, as also to encourage NGO's like INTACH conservation centres.

Currently, state governments and private institutions and individuals look to the NRLC and INTACH conservation centres for solving their problems relating to conservation. This is possible since both the centres do not have collections of their own. The NRLC has been able to excel as a research centre since it is both designed as one and its scientists, who have specialised in multi-disciplinary areas of conservation like stone, metal, bio-deterioration and so on, could continue with their specialisations throughout their career. The Central Pay Commission has recommended the amalgamation of NRLC and the Archaeological Survey of India to create a common archaeological service. Whether this step – a brainchild of administrators, not of professionals – will be detrimental to the conservation profession in India and whether it will adversely affect the research on various specialised branches in conservation remains a question that only time can answer.

## Showcasing heritage

ASHIS BANERJEE

WHATEVER its pre-history as an organised movement, the beginnings of contemporary conservation can be traced to mid-19th century Europe. This coincided with the rise of industrialisation and urbanisation, both of which affected the built environment as well as began to replace things made by the hand of man. Conservation evolved as a dialectical counterpoint, evoking an appreciation for crafts on the one hand and the traditional built heritage on the other. At least in some parts of Europe, this phase also coincided with the revival of religiosity which, at least initially, resulted in attempts to restore old churches, often without the necessary knowledge of the traditional building techniques.

In the U.K. the name of William Morris is most representative of this new genre of romantic thinking about the past. His name is also associated with the establishment of the Society for the Protection of Ancient Buildings (SPAB), set up in the 1860s and which was, in a manner of speaking, a precursor to the National Trust set up in 1895. The SPAB still enjoys a healthy existence, organising informed lectures all over the country for

the buffs and specialists alike. The National Trust, on the other hand, has a membership of 2.5 million and looks after 70% of the coastline of Britain, in addition to hundreds of heritage properties.

The SPAB initiated the revival of traditional building techniques, moulding the motive to 'repair' into a specialised focus on the correct techniques of restoration and conservation of stone, timber, stained glass, frescoes, paintings and so on. The National Trust developed this knowledge and applied it to the vast heritage properties which came under its control. These efforts were reinforced by the English Heritage – a government initiative.

In India the interest in conservation arose not so much as a consequence of similar circumstances, but as a transference of the mood in Europe, especially Britain. The Archaeological Society of India (ASI) set up in 1861, extended the work of the Asiatic Society which was already in existence (and concerned itself with oriental knowledge and art), as well as of the Public Works Department and sometimes the Garrison Engineer. It represented a facet of the larger effort of colonial rule to empirically record and classify information about the colony. Thus the ASI was a part of the larger family of surveys initiated and set up by the colonial rulers such as the Survey of India, the Botanical Survey, the Zoological Survey, the Geological Survey and the Anthropological Survey of India.

The approach of the ASI to many of the sites that were rescued from obscurity was not only to conserve but also to protect them from vandalism and wanton destruction arising out of indifference or ignorance. There were many sites, for example Buddhist ones, which had ceased to have an

emotional link with the local people but were nevertheless considered historically important and valuable for a tradition that had largely shifted out of mainstream India.

The publications of the ASI and the signage used at the sites do not indicate any pressing desire to communicate to a wider audience, except in the specialist's terms. The idea, however, was not to keep the visitor at bay. On the contrary, through a resolution of Parliament, the entry fees to heritage sites and monuments were kept low so that most people would be able to afford to enjoy the glorious achievements of the past. In order not to compromise the flow of funds into conservation by making it contingent upon earnings from entry fees, a provision was made to sustain the ASI from the Consolidated Fund of India. Archaeology departments set up under the state governments followed much the same pattern.

The basic presupposition behind conservation is that the impetus to conserve derives from an understanding that it is necessary for us to preserve for posterity what we have inherited from the past. This effort would be nullified if carried out in a manner which diminishes the authenticity of the original. Preserving with authenticity is what conservation is then all about. In this sense conservation looks beyond the immediate linkages between heritage sites and the communities surrounding them. It derives its legitimacy as well as its relevance from history and addresses mankind as a whole.

Conservation therefore is not devoid of a pedagogic purpose. In its broadest sense it includes the appreciation and enjoyment of the greatest manifestations of human imagination and the highest perfection of skills. For those of the *present*, it strives to

hold a mirror in the form of the past in all its complexity and therefore without bias or prejudice. For those of the *future*, conservation ensures that they too get an equal chance to understand and enjoy the past. Implicitly, it is a responsibility borne by the present towards the future.

In general, therefore, conservation of the built heritage is no different from the conservation of nature with its discourse of 'intergenerational equity'. The argument being that if this generation permits the extinction of endemic species and rich biodiversity, or allows large scale destruction of forest resources or depletion of aquifers, there will be irreversible changes in the environment with losses not within the capacity of the present generation to compute or compensate.

Similarly, the wiping out of historical evidence by negligence or deliberate acts of destruction through a privileging of other needs can lead to an irreversible loss of knowledge, denying the generations to come – not only of an opportunity to understand and interpret the past but also to see themselves as a continuity of an aesthetic and creative tradition. This sense of a possible loss informs the well thought out 'Culture and Development Report' of UNESCO, published a couple of years ago.

The following passage taken from the Report of the Expert Group on Archaeology, 1984 (also known as the Mirdha Committee Report) speaks eloquently and with a certain degree of pathos on this subject:

In a developing country like India, both central and state governments often launch irrigation or industrial projects. In the case of river valley and dam projects, important archaeological areas are threatened with submergence and the Survey is not

kept aware of these projects at the initial stage. Only at the last stage is the archaeologist called upon to take up salvage operations. It may be recalled that in the case of Nagarjunakonda, a high power committee with the then prime minister as chairman took adequate steps for the excavation of the site and for transplantation of some important excavated structures to a higher altitude. Such a well-thought out approach is a rarity, with the result that many relics uncovered by the spade of the archaeologists are doomed to be irrevocably lost to posterity.

**T**urning to another facet, it is time to ask whether conservation could benefit from a more pro-active approach to tourism. In India the predominant view in conservation circles is negative about tourism, seen as antithetical to conservation. This is frustrating for other agencies given the responsibility of promoting tourism at the central and the state levels. Equally, this has resulted in a mindset such that those incharge of tourism promotion often initiate steps in the field of cultural tourism with utter disregard for conservation. A policy dialogue to reconcile the two interests seems to be urgently needed. Such a dialogue could establish different sets of guidelines for different kinds of cultural sites. Appropriate regulations for visitor management could then be commonly agreed upon and evolved.

In the last couple of years we have seen the beginning of thawing of attitudes. A few state tourism departments have begun working with the ASI to develop sites in a manner that is compatible to both conservation and tourism. But all this is still preliminary and *ad hoc*. This process now needs to be grounded upon a policy debate at the highest levels and with the wid-

est transparency to erase mutual suspicion.

It is instructive to note that in an area of much more recent origin — eco-tourism — a better practice has emerged. This may well be because it does not have to carry the heavy baggage of the past. But the main reason seems to have been a systematic co-ordination at the national level between the ministries of environment and tourism with practitioners and NGOs. This process has also been facilitated by the existence of cogent literature on the subject generated by responsible international organisations such as the IUCN and others.

The guidelines on eco-tourism are already in place, though it might be too early to pronounce judgement on their operational integrity. The important point is the existence of a document as a common reference point which can, as all such important documents do, serve as a yardstick to measure whether there have been deviations. Equally, it is a document that could be improved in the light of practice.

**A**ll over Europe one senses both pride and enjoyment in the showcasing of heritage, be it Stratford upon Avon or the Blenheim castle, York, Bath or London. Similarly in Paris, Versailles, Rouen or Florence, Venice and Rome. Visitors are made to feel welcome. Often the flavour of the site as it was during its peak, is evoked through displays and costumed guides. In return for this feeling of hospitality the visitors willingly pay a handsome entry fee. They also buy printed literature and memorabilia, which encourages more people to visit the site. In their own idiom countries closer home, such as Sri Lanka and China, are also making visits to their historic sites attractive and enjoyable. An important element in this is to

make sites easily accessible and travel to them less cumbersome.

It is true that places, which are visited by a large number of tourists, come under pressure of wear and tear and therefore demand higher investments in maintenance. But a combination of mechanisms, fiscal and administrative, can be devised in order to cope with visitor pressure. Italy, for instance, has in recent times re-examined its conservation strategy and brought about changes in its cultural administration on the organisational as well as the financial side.

**B**uilding on the partnerships that are now emerging between the ASI, the tourism departments, NGOs and private initiatives it is time we set up an inter-ministerial dialogue between the department of culture, the department of tourism and the ministries of urban development and environment. This process should encourage participation from established NGOs and private entrepreneurs and academia. Position papers could be written, circulated and debated. It would be equally important to prepare case studies from various angles such as visitor impact, visitor satisfaction, revenue generation, environmental consequences and so on. This would help in monitoring trends and reviewing guidelines as required. In other words, a sensitive management approach may evolve out of the process.

An important element in this process has to do with a better understanding of the average visitor profile. It may be necessary to shed the view that the visitor must be a hard currency foreign tourist. More likely, the average visitor will be the average Indian. This visitor too needs to be provided basic facilities and information at a historic site, while at the same time being initiated into a learning process whereby he respects the need for

conservation. This is the condition on which thinking and planning ought to be done.

**A** primary rationale for promoting tourism in India is to enable Indians to understand and enjoy the scale and the depth of our cultural traditions. Regionally constructed as the Indian personality is, it is equally thirsty for acquaintance with other regions. This has been the case for hundreds of years, *teertha* being the most compulsive and primordial example of tourism in our country. There is then a tradition to build upon. And who has not seen the Bengali and the Gujrati tourists from Kashmir to Kanyakumari, roughing it out in buses and chartered trains, which are often parked in railway sidings for days in the hot sun. There are not many vandals among these sunburnt faces.

The essence of India lies in its reality as a network of cultures which constitutes its cultural heritage. This is an enigma only to those who do not know India well, not to the average Indian who comfortably traverses through the local, the regional and the national frames of reference in the most normal way and speaks almost simultaneously in three to four languages and dialects. It is for this tourist that it is most important to conserve our cultural heritage, because the insights sown in their minds through such experiences will help bind this country together and sustain its tradition of pluralism and tolerance. The less they are exposed the more un-Indian they are likely to be.

But can they pay? Probably not enough to sustain fancy, expensive hotels but definitely enough to sustain heritage sites and the infrastructure necessary to make them accessible. With a correct strategy this bulk tourism can sustain both conservation and development of sites. The others can

bring in the dollars and sustain the fancy hotels and the upmarket end of the tourist trade.

For this, however, there is a need to focus intensively on the management of sites, the creation of interpretation centres, the promotion of good literature, curio shops and a whole range of facilities which make for good commerce. There is no need to be apologetic about the business aspect of tourism, though the sleaze and corruption that the foreign visitor has to go through needs urgent regulation and drastic control. It is their right to demand 'good value for money', not to be tricked and cheated by touts at every turn.

**F**inally, India must search for niche markets in tourism which bring in non-monetary benefits. One large pool of potential visitor is the NRI and his children. We need special entrepreneurship to respond to the needs of Indian children growing up in the US and other countries who would love to be exposed to the beauty of this land and its fine heritage of art and built form. Knowing their land better will enable them to be more confident growing up in the West. Tourism, thus, presents both a pedagogic and a diplomatic opportunity.

To sum up the main issues then – conservation developed in India under very special circumstances but in terms of its timing was not far behind European trends. The specificity of the circumstances of its origin stamped conservation with a special culture. It became the domain of the expert with a certain bias towards exclusivism. Looking to the changing circumstances elsewhere in the world, and indeed to creative endeavours in other domains such as eco-tourism within India, it may be advisable to initiate fresh thinking in the area of cultural conservation and cultural tourism.

# Stand and deliver

VIVEK MALHOTRA

THE role of culture and cultural heritage and its relationship to society and the environment is being increasingly identified by countries and global organisations as an asset of crucial importance to the development and continuity of human knowledge and values. In India, the body of cultural property – the tangible built heritage – is vast in its size and range, encompassing forms, styles and structures that are as varied as its people. It is widely accepted that this built heritage is threatened by environmental and social changes, alongside deterioration through neglect, poor maintenance, ageing, theft and vandalism.

Whether this heritage can be saved, developed, or destroyed is dependent on decisions that are taken at various levels. These decisions can sometimes be taken through ignorance, indifference, greed, or to meet political and socio-economic ends. These decisions are made by government agencies at national, state and local levels, or by organisations in the non-government sector, by business, and sometimes by individuals.

It is recognised that the scale of the task of conserving, preserving and revitalising the built heritage or man-made environment presents a formidable and complex challenge. But every challenge can also be seen as an opportunity. Among the plethora of interlocking actions that are a necessary part of any strategic plan, the development of institutional capacity to

manage heritage is one of the most urgent. There are, of course, several agencies engaged in this task, mainly in the government sector, but an increasing number of NGOs and academic institutions are also getting involved. The building of institutional capacity is dependent largely on developing two key resources fundamental to any organisation or institution – its funding base and people. This essay particularly looks at the development of the human resources, that is, the management, staff and volunteers engaged in cultural work. It also briefly looks at how a greater awareness of the issues around conservation could be generated.

It is an accepted axiom that in any endeavour it is the people who work to fulfil its mission who matter the most. They are possibly the organisation's greatest resource. This axiom applies to all areas of life, wherein human contribution makes the critical and creative difference. Bill Gates, the CEO of Microsoft, reportedly remarked about his staff, 'My assets walk out of the office door every evening.' Much the same can be said for those whose work is to preserve and conserve the man-made environment. But organisations and institutions in this field, in common with those in the arts and culture, have been slow in paying attention to the human resource needs of the organisation, particularly in comparison to the corporate and business sectors.

This is partly because organisations concerned with the arts and with conservation and heritage have developed in the non-profit, subsidised sector. They tend to be marked by value-laden missions and objectives, an attitude that the people who work for them are at all times creative and caring, and an absence of strategic planning. It is popularly assumed that the rewards of commitment to the work are sufficient for the people involved. But is it enough, given that the reliance on human resources is significant in this sector – in terms of creativity, and of inputs of time and energy by managers, staff and volunteers. Thus, the question of the development of human resources in building institutional capacity is central to the activity of such bodies. It is important to ensure that the people concerned are provided the necessary tools to make informed decisions about the environment and heritage.

In its report, *Our Creative Diversity*, the World Commission on Culture and Development calls for new thinking and training in order to revalue the relationship of societies to their heritage. It suggests that this be done by building a new institutional base structured around this relationship to the life of societies and to cultural continuities. Among its many recommendations is a suggestion that the entry of a wider range of disciplines into this new institutional base would *per se* create new educational institutions, new multi-disciplinary departments (in existing institutions), and new training approaches; and that these institutions would help to forge sensitivity and respect for the built heritage (see section on 'cultural heritage for development', p.197).

What is being stressed is the involvement of a wide range of people from different disciplines and a new

set of partners – some of whom may not even be aware of the responsibility they share for changes made to the built heritage. The cohesion in the training and education model being suggested cannot be faulted, although it is somewhat utopian. It is at best part of a longer term, structural change approach to cultural training in India. However, what can be achieved are versions of this proposition – training programmes to develop specific skills and knowledge, and educational activities which seek to create a wider awareness of relevant issues.

It was suggested earlier that the profile and characteristics of organisations and institutions in the heritage and cultural sectors are similar, that they tend to share the same problems and constraints, albeit with some differences in terms of specialisations. Their problems tend to centre around the management of institutions, where incompetent administration, mismanagement of funds, an absence of written missions, objectives and plans, poor vision and leadership, all combine to create a chaotic situation. There are a few examples of successful organisations, but they have largely been dependent on the leadership of a charismatic individual who has been able to drive the organisation forward. But all too often, once that individual is no longer on the scene, the organisation crumbles. This clearly suggests an absence of a second line of leadership and an absence of succession planning, vital for building institutions for the long term.

Another related point about those who lead organisations concerns their background. Should they be generalists, specialists, scholars, or artists? All these categories of people have been tried and no one model appears to fit the best. The minimum

criteria should be that the person has an understanding of culture or heritage, and the specifics of the organisation's work, combined with an aptitude for the type of work. *If the aptitude does not exist, they should be trained for the purpose.* What is required is a unique combination with, on the one hand, an understanding of cultural work, its content and its context, and on the other, skills in modern management techniques and processes.

The training and education institutions that can play a role in developing skills and awareness tend to fall into two core areas – those with a technical focus, and those concerned with the provision of management skills. The former would ensure that the types and levels of technical skills and technologies required in conservation or other areas of cultural work are of an international standard and are appropriate to the Indian setting.

The latter provision would take the form of management training programmes to provide instruction on the basics of management skills in areas such as financial management, fund raising, strategic planning, marketing, and advocacy. This list of management areas is not meant to be exhaustive, but to indicate the scope of such programmes. The content would, of course, need to be adapted to the needs and requirements of the sector and not reproduced in the same manner as it is offered in business management courses. It would be rooted in the Indian cultural context. The menu of courses available should be on a modular basis, preferably as a taught diploma, such that it would eventually be possible to meet a majority of the specific needs of cultural organisations in different sub-sectors.

A new initiative called the Sanskriti Institute of Management for Cultural Organisations (SIM) based in

New Delhi is being started in the area of cultural management training. The initiative is aimed at organisations, both large and small, working in the wider cultural arena that includes the intangible heritage. Its proposal identified the fact that the development of human resources to manage cultural organisations was necessary in a climate of limited resources and expanding needs.

The ability to operate within the economic constraints of the cultural sector is vital for the long term, as is the need to acquire skills to provide support and encouragement to the sector in ways that are rational and cost effective. The objective is to create a 'culture of management' within the culture sector itself. However, the proposed institution, which seeks to inculcate the principles of management in a cultural context, must itself be imbued with an understanding and appreciation of the roots of cultural practices and services. Thus it would base its work on developing a sound understanding and knowledge of the present cultural context and examine the background and history of cultural organisations in India through research, case studies and field visits.

**T**he initial findings of a limited training needs survey of cultural organisations, commissioned as part of the research methodology and reported at the inaugural conference of the SIM in March of this year, came up with some alarming findings about the sector. The main results were that managers showed a lack of awareness of the weaknesses and problems of their organisations; many organisations had flat structures and were personality driven; there was a lack of understanding of how and what management means in their organisational context; there was a focus on the train-

ing needs only of artists, concurrent with limited perception of how management training might help the organisation's leadership; an absence of networking among cultural organisations and, consequently, limited knowledge and sharing of problems and solutions; limited pride in working for the cultural sector; and last but not least, a high level of apathy and complacency. This list is indicative of the work that needs to be done.

**I**f we have set goals to be achieved in the cultural arena, it is appropriate that such management training, to be more widely accessed and understood, should be open to all the people connected with the sector: managers, artistic and administrative personnel working in the performing and visual arts, in museums, crafts organisations, festivals, exhibitions, heritage organisations, arts centres, relevant government departments, policy-makers, promoters, trustees and board members, and experienced and dedicated volunteers wanting to learn new skills.

One way of building awareness and raising consciousness about the built heritage is through the formation of strategic collaborations between heritage organisations, other organisations in the same or similar field, non-profit organisations, business, government agencies, the community and other stakeholders – for mutual benefits to the partners and to the public. This is a grouping which brings together all stakeholders with the requisite skills, experience, knowledge, funding and commitment to carry out the decision. This could be centered around projects or be part of a long term view. Such collaboration is meant to indicate a commitment and relationship which benefits from comprehensive planning and communication on many levels between the

partners. Some of the possible benefits that would arise are:

- \* Working with other organisations (who may initially be perceived as competitors) could provide a basis for cutting costs by combining certain administrative functions and overhead expenses to achieve economies of scale.

- \* It could provide the basis for extending the 'customer base' through an expansion in the numbers of people reached by pooling mailing lists. Hence, an awareness of issues around the project could be spread wider.

- \* The development of new funding sources otherwise not accessible from the base of a single organisation. Funding can be a corollary to collaboration.

- \* Business would be more interested in making a contribution to a project where a high level of commitment and communication exists, on the basis of being good corporate citizens and for increased visibility.

- \* Government agencies would be able plan in a strategic manner and improve the utilisation of their resources.

- \* Collaborations would attract more media attention because of their relative uniqueness and effectiveness, thus generating a greater degree of awareness.

**T**he formation of viable partnerships is a major route to achieving an organisation's goals and providing better services to their customers as also to the community. Each partner must learn from the other's strengths, be flexible and accept cultural differences. The processes undertaken prior to the formation of the partnerships are the key management tools – to be able to diagnose, identify, plan, analyse, achieve and sustain the objectives of the organisation and thus manage the financial and human resources in an effective manner. This could be a positive way forward.

# Reminiscences of a conservator

○ P. AGRAWAL

WE often complain that requisite facilities for conservation of cultural heritage are not available in the country today. Yet if we compare the situation with what it was immediately after Independence, there is no doubt that it is far better now. Looking back in time some 45 years ago, I am reminded that there were few conservators in the country. When I joined the Archaeological Survey of India in 1952, I was attached to the chemical laboratory of the Museums Branch of the Archaeological Survey of India. I distinctly remember that we were hardly three or four, besides our boss, T.R. Gairola, one of the pioneers in this field.

There was one small hall where the laboratory for restoration of antiquities, paintings and scrolls was situated; it was the place for analysis and also for office work. The laboratory tables were neither designed nor fabricated for laboratory work. No one

knew for what purpose those tables with heavy legs and bulky tops were manufactured. We were badly in need of some tables but had no money in our budget. One fine day we saw stone tables, huge big tables, lying in a store-room full of junk. These tables were not in use and we surreptitiously transported them to our laboratory which we were determined to build.

By way of equipment, we had a small microscope of which we were proud. Later, when we obtained an ultraviolet light, it was a cause for celebration. There was no money to purchase a fumigation chamber; though it was considered absolutely necessary for the wooden objects. A make-shift fumigation chamber was fabricated with an empty oil drum, also recovered from the junk store. Some glass tubes were inserted in the drum by drilling holes at appropriate places. The fumigating gas was allowed to enter the chamber through

the tubes, which were then blocked with pinch stop-cocks. This home-made fumigation chamber served us well for many years till we could afford a proper wooden one. The moral of the story is that one does innovate when in dire need.

**W**e also wanted to build a library for the laboratory. Unfortunately, our boss, T.R. Gairola, could sanction only Rs 50 against any one bill. Any amount above that needed the approval of the Director General of the ASI, a procedure which could take months or years. We found a solution to that predicament by purchasing one book at a time, thus limiting the bill to under Rs 50. Luckily, in those days, books were not expensive. Also, there were few books on conservation. We soon had a sizable library.

This was my first experience of establishing a conservation laboratory without much money. That experience helped me a great deal in the future, when I took upon myself the task of creating conservation centres throughout the country.

Incidentally, this was the biggest museum conservation laboratory of its time in India. The National Museum, New Delhi which I was to join later, was being built at that time. Its newly founded collection of art and archaeological objects was still at Rashtrapati Bhawan.

In the early 1950s there were no formal training programmes. Conservators are lucky that we now have the National Museum Institute of Conservation, Museumology and Art History, which offers a two years MA degree in conservation. We had to struggle by ourselves, under the supervision and guidance of T.R. Gairola, a very thorough teacher.

When the National Museum moved into its new building in 1960, the laboratory had already started

functioning in one of the big halls on the second floor. It was the foresight of planners that the conservation laboratory was considered an essential and integral part of the museum. The National Museum Laboratory functioned under T.R. Gairola with me as his deputy, and steadily gained in reputation. It became famous for its technique of transferring wall paintings from old dilapidated buildings to new sites. Its first project was at Chamba for transferring wall paintings from the Rang Mahal to the National Museum and to the Bhuri Singh Museum, Chamba. It was the first time that such a transfer of wall paintings was successfully carried out in India. In the years to come, the National Museum was asked to oversee many such projects.

**T**he National Museum Laboratory soon became a central laboratory for Indian museums, giving advice, imparting training and treating objects of other museums, besides those of the National Museum.

The establishment of the National Research Laboratory for Conservation of Cultural Property (NRLC) at Lucknow was a landmark in the history of conservation in India. Having worked and trained at the Central Institution of Restoration, Rome, I was determined that there should be a similar institution in India.

At the beginning it was only a dream and even in my wildest imagination I never thought that it would become a reality. But with the interest and support of Nurul Hassan, Union Minister of Education at the time, the dream took a concrete shape in 1976. The Ministry of Finance allocated a tiny budget for the first year. Given my earlier experience of working with minimal budgets and infrastructure, I accepted the challenge without hesitation, knowing

fully well that once the laboratory was established and started to show results, money would be no problem. And indeed that is what happened.

**T**he NRLC received grants from UNDP and UNESCO for the purchase of most of its sophisticated and advanced equipment. Its scientists and conservators were trained abroad in the latest techniques of analysis and research. The Government of India approved the construction of its own specially designed building, which became functional in 1986. Several research projects were undertaken by the NRLC and it was soon counted among the best research laboratories.

I gave special attention to the library, which acquired most of the important books on conservation, analysis, microscopy, biodeterioration, petrology, and other related subjects. I simply could not believe the remarkable change from the days when I had to order one book at a time. In the days when I was with the museum branch, we could not subscribe to even one good journal. The NRLC library now regularly receives over 100 journals from all parts of the world. What a difference! We have every reason to be proud.

By the end the '80s, major institutions like the ASI; the National Museum, New Delhi; Indian Museum, Calcutta; the Salar Jung Museum, Hyderabad, and others had conservation laboratories of their own. However, many of us felt that there were no arrangements for the restoration of art objects belonging to private owners, or with temples, churches and other religious organisations.

An opportunity of this nature arose with the establishment of the Indian National Trust for Art and Cultural Heritage in 1984. Pupul Jayakar and Martand Singh were keen to initiate projects for conservation of art

materials. I was summoned to New Delhi to meet Jayakar, B.K. Thapar and Martand Singh. Soon a plan for setting up the first INTACH Conservation Centre at Lucknow was prepared; it came into being in 1985. As always, money was in short supply but that did not deter us. I knew from past experience that money is not a major hurdle for a worthwhile project. I was still the Director of the NRLC and agreed to act as the Honorary Adviser of the INTACH centre. The burden of its day-to-day functioning fell on my wife, Usha Agrawal, who had received her training at the National Museum and at the Regional Office of the International Council of Museums, New Delhi.

**S**everal important projects were taken up by the conservation centre, rechristened as the Indian Conservation Institute in 1989. The ICI has covered the entire spectrum of conservation activity – a wide variety of objects, including stone sculptures, metal objects, manuscripts, books, oil paintings, wall paintings, textiles, and so on. There are separate divisions dealing with each of these areas. There is a photo-section and library. Artifacts are received from governmental as well as non-governmental sources from all over the country. Soon ICI was recognised as a major institution. I think what has contributed most to its functioning, besides the devotion of its staff, is the flexibility and autonomy in decision-making. There is hardly any interference in our functioning from the chairman or the secretaries of INTACH.

We received financial support from agencies like The Ford Foundation and NORAD. INTACH U.K. Trust supported a very major project of ICI entitled National Project on Wall Paintings. The launching of this project was a major achievement of ICI,

encompassing several areas in its fold and described 'as a most comprehensive project of its type ever undertaken anywhere.'

**W**hat made it unique? Its size? Its concepts? Its wide range in time and scale, or was it something else? I think it was everything put together. The main components of the project were:

i) Survey of wall paintings of India to prepare descriptive reports and carry out photographic documentation.

ii) Analysis and identification of materials of wall paintings of India. Samples of plasters and pigments from wall paintings were collected and analysed in the laboratory. A large number of wall paintings from Rajasthan, Kerala, Karnataka, Madhya Pradesh, Uttar Pradesh, Tamil Nadu and other states were covered and analytical data on them is available. Research on problems of conservation was also part of the project. Working in collaboration with the NRLC, the problems of biodeterioration of wall paintings were looked into and solutions found.

iii) Actual conservation of wall paintings. Several important sites were examined and conserved. These were (a) Naithod Temple, Kerala (b) Sheesh Mahal, Nagaur, Rajasthan (c) Chhatris of Kusum Sarovar, Govardhan, U.P. (d) Shree Brijraj Swami Temple, Nurpur, H.P. (e) Rani Jodha Palace, Nagaur (f) Sri Rangaswami Temple, Srirangam, Tamil Nadu (g) St. Alosius Chapel, Mangalore, Karnataka (h) Holy Name Cathedral, Mumbai.

All this while, I was conscious of the shortage of trained personnel. Consequently, two training courses in conservation of wall paintings, each of six months duration, were held to prepare future conservators. We also organised two national seminars on

conservation of wall paintings, one in 1989 and the other in 1995.

Several important publications have been brought out on wall paintings. Mention may be made of Examination and Conservation of Wall Paintings of Sheesh Mahal, Nagaur (1989); Wall Paintings of India – a historical perspective (1990); and Conservation of Wall Paintings in India – Achievements and Problems (1995).

Personally, the national project on wall paintings has been one of the most satisfying I have been associated with. Do I have any regrets? Yes, there is, at least one. I was keen that it become a truly national project, with several major institutions collaborating and fulfilling their selected parts. Several meetings were held with representatives of major institutions. Everyone agreed to a collaborative programme, but unfortunately when the time came for action, it did not materialise. I hope a day will come when all our institutions can work as a team, for a common cause.

**A**nother thrust area has been training. ICI has regularly organised courses in two main areas: preventive and curative conservation, the former as workshops, the latter in courses, usually of six months duration. These courses are regularly held at ICI Lucknow, particularly in the domain of conservation of paper manuscripts. Besides these regular courses, we also accept interns from abroad for studies in conservation. ICI has invited foreign specialists for training in areas like the use of leaf caster in restoration, metallurgical studies in archaeology, and use of low suction table.

Encouraged by the success of the Lucknow centre, we thought of establishing other centres in the country. The New Delhi Art Conservation Centre founded in 1990 has prepared

an excellent team of restorers specialising in various aspects of conservation, particularly oil paintings. This centre has conserved/restored paintings of masters like Jamini Roy, Amrita Shergil, Raja Ravi Varma, Nandlal Bose and several others. An exhibition entitled 'Raja Ravi Varma and Amrita Shergil Restored' was mounted at the National Gallery of Modern Art, New Delhi, to present to the public the implications and intricacies of restoration.

I firmly believed that there should be an INTACH conservation centre for the South, as bringing objects all the way to New Delhi or Lucknow is not easy. As we did not have enough funds, we managed to persuade the Chitrakala Parishath, Bangalore to collaborate with us. There was active support from T.P. Issar, former chief secretary of Karnataka and Nanjunda Rao, general secretary of Chitrakala Parishath. Initially we loaned some of the furniture and equipment from ICI Lucknow, which in a way became the mother institution. A nucleus of the laboratory was soon set up and a trained senior conservator, Chandras Bhat, was sent from Lucknow. ICKPAC was inaugurated by the Governor of Karnataka in July 1993. Since then it has handled several important projects.

Encouraged by our success, negotiations were initiated with the Department of Culture, Government of Orissa, with the intention of starting a centre in the East. The authorities were convinced that a conservation centre was needed for Orissa and the government was ready to finance it if a matching amount could be raised from INTACH. NORAD came to the rescue. Thus the fourth centre under INTACH came up to serve the eastern part of India. It specialises in conservation of palm leaf manuscripts and

will soon be functioning as a training institute in this field for Asian countries.

So far we had thought of establishing a centre for a region or state. However, sometimes the collection of one single institution is so immense that it may require a conservation unit of its own. One such institution was the Rampur Raza Library. At the initiative of Moti Lal Vora, Governor of U.P., a collaborative project involving the Rampur Raza Library and ICI was prepared with the purpose of establishing a full-fledged conservation centre. It immediately received the approval of the Governor and the Government of India. The strategy employed for Bangalore was also used at Rampur. A senior conservator from ICI Lucknow was transferred to Rampur to look after the centre and train local staff. Some equipment was also transferred from ICI. It is now well equipped, several persons have been trained and the work of restoration of the manuscripts and paintings of Rampur Raza Library is proceeding smoothly.

This was the first time we had collaborated in the running of a centre. So far we had been content with rendering advice on the establishment of conservation centres, but the progress of the Rampur centre provided a real insight into the psychology of centre-building. We now know why several institutions to whom we had rendered valuable advice did not, or could not, set up a functional conservation laboratory. Possibly some of them lacked confidence. At Rampur, this confidence was generated by ICI, with the presence of a senior conservator and frequent visits by the chief conservator.

Our next partnership was with the Mehrangarh Museum Trust, leading to the establishment of a new

institution in 1996. It specialises in the conservation of wall paintings. As at Rampur and Bangalore, trained personnel have been seconded from ICI, Lucknow.

It is interesting how one's thoughts and priorities change. I now think that conservation should have some goal. By itself it has no meaning. Earlier, like other conservators, I too was of the view that if an art object could be conserved, it was enough. Even if the object remained in the vaults for eternity, it did not matter. Now, with several decades of experience behind me, I believe that unless the object can be put on display, it is like money locked in a bank but never used. If there is any danger to the objects, it is a challenge the conservator should be able to meet. I am not advocating unlimited exposure, only occasional exhibition under controlled conditions. This idea needs to be carefully considered.

Equally crucial is the need for all-round development of museums where the art objects are stored and used for study and exhibitions. These institutions must be reorganised in a manner that they perform the functions expected of them to fulfil their social obligation. At INTACH, we conducted a survey of museums to assess their functional status so as to propose action plans for each of them. Some states like Orissa and U.P. have already started implementing the suggestions.

With all that has been done in the government sector and by INTACH in the NGO sector, one may ask: what is the status of conservation in India? To this is related the importance we attach to our heritage. Do we want our cultural heritage to live or slowly disappear? At the present moment, the signs are positive. I hope that they will continue to remain so.

# Ploughing a lonely furrow

RUPIKA CHAWLA

AS a conservator of paintings I often confront the confusion that arises among people when I introduce myself. Perhaps, this is only natural, as conservation is a little-known field. Most of the time 'conservator of paintings' draws a blank, as conservation is usually linked to wildlife and nature in the popular imagination. I then alter my usage and say 'restorer of paintings', upon which brows clear and comprehension dawns. Unfortunately, I am then confronted with the word that laymen link with restoration—repainting. Alas! Repainting is what a painter does, depending on technique and method of application. He/she will re(paint) to achieve a certain desired effect, or to correct a mistake which needs to be obliterated.

A restorer on the other hand cleans, stabilizes and brings back to health a damaged or deteriorated work of art. The restorer, who has today emerged as a more complete conservator, is scientifically attuned in discipline and attitude to the materials used and in the methods of examination and practical work. Respect for the authenticity of a work of art—the materials that have been used in its making, its history and its physical appearance—is required.

While a conservator does not 'repaint' he/she retouches, which means the filling and colouring of lost area. Given the range of words starting with the prefix 're' it may be relevant to relate an incident regarding Satish Gujral, the painter. On his return

from Mexico in 1959 he stopped in Paris where he met an old friend from India. Gujral informed him that he had been to Mexico to study art. The friend proudly declared that he had studied restoration in Paris. 'So what!' said Gujral, 'I also restore. I make a painting, I store it. I take it out, I restore it.'

**A**s a science and profession conservation is barely acknowledged in India, though globally its role has great significance. Its antecedents go back about two centuries to developments and changes that took place in Europe at the time.

The 18th and 19th centuries were linked to archaeological activity in Egypt, Italy and Greece. The methods of restoration then used could not halt the deterioration of many archaeological finds. To make things worse, pollution was on the increase in industrialised Europe. Around this time public museums emerged as receptacles of original and historic art treasure. Museums had evolved from 'cabinets of curiosities' to repositories of rare objects. Equally important in that period were the private collectors. With the establishment of museums, the entire approach to art and antiquity was formalised and made more definite.

The early 19th century saw the beginning of the movement to halt deterioration of archaeological finds. These were early days and the methods, though aimed at preservation, were empirical and destructive. By 1888 the system stabilised to some extent. Knowledge about the nature of archaeological materials – clay, stone, wood or metal became crucial. It also became important to research the causes of decay, before and after excavation. An analysis of the reasons for the deterioration of an art object holds the key to modern conservation. It is essential to understand whether the causes are environmental, struc-

tural, related to human negligence or whether there is something intrinsically wrong with the material.

It was only natural that art and science had to combine to sort out the many problems that had emerged. Radiography was discovered by Wilhelm Roentgen in 1895, revolutionizing medical investigation. It also made possible a greater understanding of what lay behind the top coat of the paint. The pigment industry made rapid progress, adding a wide range of colours for artists. Chrome yellow appeared in 1820, cadmium yellow in 1817, cobalt yellow in 1861, viridian in 1838. Other colours were to follow, a large exciting range, enabling the impressionist painters to toss bright tubes into their bags and saunter outdoors to paint nature.

**I**n 1944 the Istituto Centrale del Restauro opened in Rome, acquiring seminal importance after the war in 1947. Italy had to put together the shattered remains of priceless murals damaged by bombs. This period perhaps signals the end of non-scientific restoration where work was carried out without focusing on the nature of a problem or the nature of the material. Only a few years earlier, Cecconi-Principe, a teacher at the institute had startled students by pouring alcohol on a small panel painting, setting it on fire and letting it burn until he judged the time was right to extinguish it. He told the class that the old varnish was weakened by what he had done and gently rubbed it off with great ease. In today's context such an attitude, or a dare-devil approach, would be seen as truly reprehensible.

What is the status of conservation in India as we head towards the end of the 20th century? To answer this question we need to pursue two lines of enquiry: conservation as understood by quasi-conservators,

'restorers' in government institutions, art dealers, painters, architects and impresarios looking for the main chance and a quick buck. These people sully the reputation of the few authentic professionals in the country. The second thought process pushes us in the direction of diagnosing the mindset of Indians who treat their heritage with scant regard.

**C**onservation relies on a heavy dose of theory and practical training, which ideally should be for three years followed by a year's internship. A student trainee is expected to assimilate the history of art and architecture, theory of colours, techniques, methods and materials used in all art forms. He must know chemistry, the theory of light, the different rays used for investigation, and must be familiar with scientifically developed consolidants and synthetic resins, their systematic usage, the role of the environment in the deterioration of objects, and have the experience to put it all into practice. Like all professions, it is bound by strong codes of conduct. Most quasi-conservators and chemists working in government institutions pick up things as they go along or inherit antiquated practices, where either a holistic view or ethical practice is at a premium.

Art dealers over-paint and patch up paintings, cover them with dark varnish, hide defects and problems, seal the painting back and front, and sell them to innocent buyers who are seduced by the 'mellow' look of the work. The original painting, screaming for discovery, lies stifled inside. For decades now, painters have done almost the same thing to their own works. Art collectors have for long taken cracked or damaged paintings back to the painter who repaints the trouble spots or, perhaps in a moment of inspiration, changes the

image as well. The actual problem lies within the layers, waiting to emerge again.

For the last few years now, it has been a source of great delight for me to receive paintings from the artists themselves. It signals realisation that the two activities are very distinct though united: a painter paints and cannot do the other, a conservator conserves and should not do the other. Take for instance, the role of architects in building conservation. Like painters they are equipped to create something new but not to handle conservation of built heritage. This requires a completely different expertise which is the domain of the architectural conservator. Unfortunately, such a professional is rebuffed by the architect as unnecessary, repudiated by the archaeologists as irrelevant.

**A**rchaeologists claim they can do it all. Recently, a director general of the Archaeological Survey of India stated that their archaeologists and chemists were competent to handle everything and did not require any architectural conservation. Somewhere between these sets of people is the impresario who too has no time nor need for the conservator. These impresarios work inexpensively, putting their faith in masons, hired labour and the traditional artisan. Such artisans, whose knowledge no doubt should be assimilated into scientific conservation, cannot and should not be allowed to function on their own. They too, like the painter and the architect, show scant respect to the integrity of the work, to its physical appearance, its structure, its layers, its history and its authenticity.

The disjunction with professionals occurs because they say things that no one wants to hear, they fuss endlessly, they discuss ethics *ad nauseam* and are such kill-joys. As a

tribe, professionals are not likely to grow rapidly since the one and only institute teaching conservation has suffered an abysmal decline. The Institute of History of Art, Conservation and Museumology founded as a deemed university by Laxmi Sihare in the late eighties has deteriorated over the last eight years. No government policy has checked the malaise, since conservation enjoys no importance among people who have little respect for their heritage.

**M**any of the students are of a low academic calibre since the bright ones stay away as the government cannot assure them jobs. No jobs? With over 400 museums in the country, we do not have a single conservator worth the name! Some years ago it was suggested that the Department of Culture create a post or two in strategic museums each year to accommodate deserving graduates. Nothing has been heard since.

The School of Planning and Architecture is the only institution which trains students in architectural conservation. It attempts to impart to students the need for a holistic approach to Indian heritage, so that later, once in the field, they look at the architectural, anthropological and environmental factors before intervening in their reconstruction.

A little of how India deals with problems of conservation may be recalled. Palaces and aristocratic homes have for long accumulated *objets d'art*. Take paintings as an example. It must be realised that they naturally deteriorate with time, in the manner that all things which are created do. The causes could be many: damp walls, dark rooms, monsoon leakages—all leading to mould growth on paintings. Canvasses tear on being moved around or stored carelessly. Environmental, technical and mainte-

nance factors become an important index of preservation.

For over a hundred years now, the anticipated reaction from collectors with stricken paintings has been to call on an artist for help. He comes along with dark oil paints and haphazardly covers the troubled areas with opaque blobs of colours. Fungus growth, tears, holes, cracks and flaking have for decades received the same 'treatment'. This insensitive, non-scientific approach to replicate the artists' original intention, which is considered sacrosanct, ruins most paintings. Such eclipsing of the original paint alters the context of the painting, distorts the painter's work and style, and leads to historical misinterpretations of art. Glaring examples of ugly blotches covering original paintings can be found in the Ravi Varma Gallery in the Srichitra Art Gallery in Thiruvananthapuram. This museum is not the only one displaying such works; museums all over India display a similar pattern.

**I**n fact, our museum culture is itself inadequate and unaware of professional standards. Conservation and museumology have yet to be understood by its guardians—the civil servants who decide policy, or even by the public. Visitors to galleries and museums, such as those mentioned above, will not find much amiss with the paintings on view. There is no way for them to know what a work should actually reflect; there is no system of instruction, no method of comparison.

Much of the same malaise can be seen with the 'restoration' work on built heritage. Cement and mortar is applied wherever cracks and losses appear, covering the original facade. Problematic murals get whitewashed, obliterated, dispensed with. Cracked marble blocks are removed as happened at the Taj Mahal, to be replaced

by new Makrana marble. What is central is originality; repairing a cracked marble is therefore imperative. Replacing alters everything.

City planning provides its own callous instances of the savaging of built heritage, which in other countries is considered invaluable and precious. The Siri Fort area in Delhi was destroyed to accommodate the Asian Games Village; Sadhana Enclave was built on the *chhatris* and other levelled remains of Jehanpanah, the 14th century capital of Mohammad bin Tughlak. The Hauz Rani tank of the 12th century was razed to the ground by the Delhi Development Authority in order to accommodate the Saket sports complex in 1989. It was meant to commemorate Jawaharlal Nehru's birth centenary, who ironically, had shown great concern for the preservation of monuments. He had taken abundant precaution in protecting them during the formulation of the first master plan.

**A** past testifies to other cultures and explains to us what we are today. There is certainly little which has been built in the past 50 years which fills us with a sense of awe and pride of the kind our ancient monuments evoke. It is not the buildings of the five decades which bring travellers to our country, but the monuments of the past. We seem to be equally unaware of the economic leverage that our built heritage can provide and therefore of the need to safeguard it. There is no time to be lost; the time bomb is ticking and the past will not always wait patiently.

The historic evolution of scientific conservation elucidated earlier in the article was necessary to demonstrate what is required and why it does not exist in India. Is there something in our mindset which is indifferent to the value of the past? Do we philosophically believe that all things dis-

appear as we ourselves do, annihilated into nothingness, the way of all flesh?

The notion of *karma* that plays within all of us can lead us into thinking that God's will is of utmost importance, that there is no necessity for us to interfere. Maybe that is why we shrug our shoulders and shrug off our treasures, allowing the winds of change to do what they will. Moreover, we further argue, in a country assailed by so many problems, why should a few ruins and old temples matter?

**A**s a nation we are obsessed with icons and deities. The imperfect and the incomplete trouble us. A deity is worshipped because it is *purnam*, complete. It is deconsecrated when it is *binnam*, defective. The concept of restoration is therefore absent. Since we see art as disposable, parts of our ritual have been based on the same thought. Creation, destruction and creation again has been an inherent principle with us. A cracked terracotta pot is replaced, the daily morning *rangoli* scattered, only to be made again. Months of preparation create Durga and Ganapati idols which are then ritualistically drowned, to disappear forever. Where is the concept of restoration?

Brahma the Creator, Vishnu the Preserver, Shiva the Destroyer. What Shiva destroys of what Brahma creates is mere decayed and decadent matter which must be removed. We have to learn to think clearly and scientifically and while accepting the beauty and reality of tradition, accept the fact that there is more than just that. A noble past needs to be protected and understood in all its anthropological complexity and its economic possibilities. It is neither decaying nor decadent but just seriously unwell, needing to be brought back to health and beauty. May Vishnu the Preserver prevail.

# A painter of visions

JYOTIRMAYA SHARMA

Ananda K. Coomaraswamy felt that a true civilization valued human beings more than things. To be civilized was to possess the capacity to discriminate, to judge. It also consisted of a certain quality of recollectedness or detachment. Civilization was necessarily a view of life that was balanced, where the place of values was not ambiguous. This in turn required stillness of mind and body, the need for self-reflective repose. It was imperative, therefore, for any idea of civilization to cherish a non-instrumental view of life, that is, where people's interests or sense of agency were not entirely directed towards utilitarian goals. Hence, any view of life that believed in multiplying the quantity of desires rather than in the refinement of their quality was no civilization at all.

For Coomaraswamy the question 'What is civilization?' was not an exploration into philosophical abstractions. The full force of the question emerges when the question is rephrased as, 'What is it to be civilized?' In one sense, posing the problem regarding the meaning and possibilities of civilization helped Coomaraswamy to restate first principles and evolve clarity regarding the constellation of values in which we operate. Once these operative first

principles were established, then, whether it was his intervention in the nationalist movement or his interpretation of Indian art or even his metaphysical excursions, Coomaraswamy returned constantly to the all important question of civilization. It was to remain a refrain in all his writings.

Another question that remained central to Coomaraswamy was that of tradition. History was not tradition, and conversely tradition was not history. Nor was tradition a Spenglerian cultural prison that condemned one to a purblind worship of the past. Tradition helps us to know *how to see* and *what to see*. In other words, tradition imparted vision and perspective. This helped an individual to integrate in the life of the community and possess symbols (including language) that were culturally evocative.

Coomaraswamy recognised that certain strands of tradition may have become obsolete and had to be abandoned. In one sense, the transformation was brought about by western modernity. Tradition, when truly inspired, rejects ambition, competition and quantitative standards. Western modernity, in contrast, built itself on the foundation of notions of social advancement, free enterprise and production in quantity: man's needs and desires were constantly multiplied by

advertisement and greed. Further, political and economic goals had become much more important.

**A** rejection of tradition in favour of modernity, however, had led to forms of self-hatred, lack of compassion, and a deep sense of inferiority. Coomaraswamy clearly had the degeneration of India under British rule in mind when he speaks of the rupture caused by modernity. The solution for him, however, does not lie entirely in either the political goal of seizing power or in imitating Europe; nor does it help in aspiring to a mindless return to the past.

A renunciation of what appears to be obsolete is justified; political and economic problems cannot be ignored; man and man's world are still to be explored; but with all that there has been too little love, too much of snobbism, too indiscriminate a taste, too little distaste.... For a moment, perhaps, we desired to turn back the hands of the clock, but that was only sentimentality, and it was not long before we remembered that fresh waters are ever flowing in upon us. We have learnt that we are exiled; but we would not and cannot return. In India, as in Europe, the vestiges of ancient civilization must be renounced: we are called from the past and must make our home in the future. *But to understand, to endorse with passionate conviction what we have left behind us is the only possible foundation for power.* ('Young India', *The Dance of Shiva*, p. 171-77; italics mine)

In short, politically and economically free India, but with the soul of Europe was not an ideal to be dreamt of, or to live and die for.

Before going on to consider Coomaraswamy's prescription for regeneration of India in terms of understanding and endorsing 'what

we have left behind us', two important aspects of his thought need careful delineation. First, his evaluation and critique of modernity as embodied in European models of science and technology; and second, the place of foreign ideas in the context of India.

Modernity, according to Coomaraswamy, is usually satisfied with imitations. It places imitative dexterity and novelty above the power of great invention and nobility of symbolism. Modernity has its own illusions and superstitions. The modern superstition is the superstition of facts. This is far more dangerous than any superstition of the imagination; modernity assumes the superiority of the soul on the mere grounds of increased empirical knowledge. It places greater faith in the senses than in the wisdom of intuition. It confuses outward signs of material prosperity with civilization itself. In spirit, Coomaraswamy belongs to a strand of nineteenth century thought that rejected the uniformitarianism of the Enlightenment, with its cult of universalism, rationalism and empiricism.

**T**here is no wholesale rejection, however, of European science and technology as demonic in Coomaraswamy's thought. Machinery need not be abandoned in favour of culture. A civilization must be in a position to strike a balance and reasonable division of labour between man and machine. The problem with excessive machinery is that it does the essentially human part of the work, and in consequence stifles spontaneity, freedom and imagination. The place of machinery in a true civilization should be that of a servant, and not a master. If a reversal of this rule takes place, we are condemned to an aesthetically and spiritually inferior environment.

It does not help, Coomaraswamy feels, to paint modern indus-

trial civilization as particularly diabolical—a *diabolus ex machina*. To do so would be an admission of the ineffectiveness and impotence of a community. It would indicate a lack of will and acceptance of the status of epigoni on the part of a civilization. In turn, there was nothing wrong in assimilating or adopting foreign ideas and customs as long as this did not entail mindless imitation.

For it is not deep acquaintance with European culture that denationalised man in Asia but an imperfect and servile apprehension of it. Those who understand the culture of others find in it a stimulus not to imitation but to creation. Those who do not understand become intellectual parasites. ('Poems of Rabindranath Tagore', in *Art and Swadeshi*, p. 102)

**C**oomaraswamy was emphatic that the regeneration of India could be achieved through art, and not by politics and economics alone. It was important to make the lives of people and the environment in which they lived as beautiful as possible. Beauty was as essential as the existence of a moral order.

[I]n fact that without beauty there can be no true morality, without morality no true beauty. ('Art and Swadeshi', in *Art and Swadeshi*, p. 3)

When art and morality complement each other, true swadeshi emerges. For it is in a fundamental sense a way of looking at life; it is learning once again the art of living. It is sincerity and the rediscovery of our ancient civilization, which was at once industrial and spiritual. It is only by revival of the artistic faculties of the people that a sense of the practical and power of organisation can be infused.

The loss of the traditional art of India was in a way a loss of the sense

of community. When a craft dies, it is not only a loss of wealth for the nation, but also a loss of wealth in the shape of human quality and community life. This leads to several ills such as child labour and work under mechanical and unhealthy conditions. What was significant about the traditional art and crafts of India was that in Indian homes, whether rich or poor, there could be found things both useful and beautiful. Arts and craft were once closely linked with the daily needs of the people, domestic and ceremonial. Anglicization of India had destroyed the beauty and romance of India's heritage.

**I**t was, however, unwise to expect the British government (or any government, as a matter of fact) to revive Indian art and traditional industries. This task had to be undertaken by the people themselves. Coomaraswamy feels that once a community becomes self-sufficient and self-possessed, political rights follow as a matter of course. Thus, swadeshi has to be more than a political ideal: it must be a spiritual-artistic ideal. The reasons for the degeneration of India; therefore, can be located primarily in Indian indifference to its own artisans and craftsmen.

We ourselves have despised and hated everything Indian and it is by that hatred that we have destroyed our industries and degenerated the status of our artisans. ('Swadeshi, True and False', in *Art and Swadeshi*, p. 9)

The artist, and not the politician, should, therefore, be the real emancipator of India. Politics is necessarily based on a hatred of the 'other'. Ideas of victimhood, self-pity or violence are an integral part of any political goal. Representative government, as seen in Europe, was no more than the victory of the most powerful interests.

For Coomaraswamy, every oppressed nationality oppresses some other or embraces the oppression of class by class. He feels that patriotism is often coloured in narrow and sectarian shades. One's loyalty should be to life itself, not just Indian life.

**T**he artist should be a very important pillar of the body politic, feels Coomaraswamy. Here, his approval of the humanism of the *Bhakti* movement becomes significant. It represented for him a humanism which contained within itself a philosophy of action, a constant glorification of life, a delight in sensuous symbolism and a consecration of humanity.

The pure politician is often no nationalist at all, in an idealistic sense. It is the work of poets (poet, painter, sculptor, musician, artist – all these are synonyms) to make their hearers free: it is they alone who establish the status of nations. ('Poems of Rabindranath Tagore', in *Art and Swadeshi*, p. 102)

Further, Coomaraswamy makes clear his disapproval of severe, dry, self-denying intellectualism, a feature he felt certain schools of Indian philosophy as well as modern science shared. What mattered much more were little things rather than grand abstractions or designs.

The painters of our visions – the makers of our songs – the builders of our houses – the weavers of our garments, these all are touchstone that can turn to gold for us both past and present, if we will it so.... They can show to us the significance of little things, the wonder of what is always going on. They tell us that we are what we are not because of knowledge or wealth or power, but because of the dolls in our childhood's games, because of the rivers that we worship as divinities, because of the beauty of women,

and the splendid indifference of men to danger and death. ('Poems of Rabindranath Tagore', in *Art and Swadeshi*, p. 105)

It is often alleged that Coomaraswamy, the historian of India's traditional art and culture, was greater than Coomaraswamy, the social philosopher. Yet, all aspects of Coomaraswamy's work have a coherence and unity that is inseparable. It is this that made him not merely an interpreter or classifier of Indian art: it made him look into the 'generative roots of art' (K.G. Subramanyan's phrase).

**F**or him, Indian art was essentially religious in content; not dogmatic, but ever concerned with reality. To understand art was to look into the meaning of that art and the thought from which it had sprung. It was crucial, therefore, to understand Indian mysticism and ideals of life. In short, to understand Indian art (or any other art) is to take cognisance of the mental atmosphere in which it grew. Thus, for the artist in India, mysticism, the sense of the unity of life, was inseparable from the delight in all sensuous beauty.

Indian art, therefore, did not aim at the reproduction of the facts of nature: the relation between art and nature was not one of art imitating nature, but bringing about harmony between art and nature. Indian art aims at suggestion; selection, emphasis; design; it expresses the realities of life subjectively. It is creative and living.

To generalise, whatever object may be the artist's chosen or appointed theme becomes for the time being the single object of his attention and devotion; and only when the theme has thus become for him an immediate experience can it be stated authoritatively from knowledge. ('The Theory of Art in Asia', in *The Transformation of Nature in Art*, p. 4)

# Books

**INDIA'S CULTURE: The State, the Arts and Beyond** by B.P. Singh. Oxford University Press, Delhi, 1998.

INDIA boasts of a developed culture, but is saddled with a developing economy. This is the context in which B.P. Singh – civil servant and author – examines the interaction between the Indian state and culture, both in the past and the present, and the prospects of cultural development in the new millennium.

While in the first chapter the author traverses the familiar ground of India's past culture, and in the second discusses the role of the state and market in its development, he provides us with the most valuable information in the third chapter where he talks about the unfolding of the cultural policy of independent India immediately after 1947. Those were the days when the country was fortunate enough to have a few leaders who had been brought up with civilized values and were sensitive to the arts.

Jawaharlal Nehru and Maulana Abul Kalam Azad (the first Minister of Education) were two among them. The author narrates how between the two, they laid the foundations of the cultural institutions and activities that have today spread far and wide in India and earned fame abroad. Azad was reported to have said at that time: '...in a democratic regime, the arts can derive their sustenance only from the people, and the state – as the organized manifestation of the people's will – must, therefore, undertake its maintenance and development as one of its first responsibilities.'

The author, in this connection, cites an interesting incident from the Nehru-Azad era, as revealed in a series of official correspondence. In June 1948, Nehru recommended to Azad the purchase of eight paintings by two Hungarian artists, Sass Brunner and her daughter Elizabeth, on behalf of the government, for

Rs 15,000. Azad agreed with the officials in his ministry that the paintings should first be evaluated by experts before purchase. Two experts (who were told that the paintings were chosen by Nehru) evaluated them and dismissed them as mediocre, saying that they did not deserve more than Rs 500 a piece.

Nehru was naturally upset, since he had already made a commitment to the Hungarian artists. He offered to buy the paintings himself at the stated price, if the government could not acquire them. He also suggested that no fresh purchases should be made, and only those paintings should be bought in regard to which commitments had been made. Ultimately, a compromise of sorts was arrived at.

The Finance Ministry, in an oblique warning against Nehru's precipitate action, issued a general instruction saying that in future it would be necessary to obtain its clearance before any commitment was made on behalf of the government regarding purchase of pictures and paintings. Although Azad finally sanctioned the payment of the original amount that Nehru had promised to pay the two Brunners, the incident from beginning to end reveals a particular disposition that prevailed among ministers, bureaucrats as well as art-experts in those days.

They tended to adhere to the principle of accountability, aesthetic standards, correct procedures and certain moral values – qualities which have disappeared from the decision-making process in today's cultural scene. No bureaucrat today would dare to question a prime minister's choice of paintings and submit them to scrutiny by experts. No art expert would have the guts to reject them on artistic grounds. No prime minister would have the humility to offer to buy those rejected paintings of his choice from his own pocket, since he is promise-bound to the painters. They are all collaborating today in the dismantling of the old cultural scene, replacing it with one dominated by amoral

philistine politicians of the Laloo-Kesri-Mulayam brand, or the Navalkar-type cultural commissars of the 'saffron brigade'.

The changes in the attitudes and behavioural patterns in the cultural scene over the last 50 years worry the author as he watches the slow degeneration of the once prestigious Akademies, some of which are enmeshed in allegations of financial irregularities, nepotism and gross misuse of government funds. But Singh still prefers the original Nehruvian policy of retaining the autonomous character of the Akademies over the bureaucratic temptation to bring them under tighter official control.

This brings us to the larger issue of the state's role in the Indian cultural scene. Singh believes in the 'guiding philosophy' of the Indian state laid down 50 years ago which, according to him, rules that, 'It is not for the state to guide culture but only to provide an environment which would facilitate dialogue among creative persons and encourage freedom of their expression' (p. xiii) – a principle with which I fully agree. It is this 'guiding philosophy' which is being violated by the present Indian government, when its BJP ministers publicly announce their plans to guide culture according to their philosophy of 'one nation, one culture and one people', which is clearly aimed at homogenizing the cultural plurality of India (to which Singh devotes one major section in his book) under the hegemony of one uniform (ersatz Hindu) culture.

The other threat to Indian culture comes from the market in an era of liberalization and globalization when art and artists are being increasingly controlled by market forces through their sponsorship by the corporate sector. This may lead to a future where, according to Singh, 'The relationship between art and society will shift from the existing creative interface, in which the artist is moved by deep values and commitments, to that of the increasingly institutionalized sets of contracts and salesmanship.'

But, unlike many other prophets of doom, Singh discovers signs of conservation, renewal and revival of Indian culture in two developments: first, the increasingly important role played by artists and creative persons in Indian society, and second, the new awareness of rights and responsibilities by the struggling backward sections who, he hopes, will provide a new dimension to the cultural dynamics of India of the future. This hope is based on his theory that while in the post-Cold War era the market prevails over military strength as the primary index of power, in the new millennium, culture will emerge as an alternative

source of power to challenge both. One sincerely wishes that his hope comes true.

Sumanta Banerjee

#### **BETWEEN TRADITION AND MODERNITY:**

**India's Search for Identity** edited by Fred Dallmayr and Ganesh Devi. Sage, Delhi, 1998.

AFTER Dag Hammarskjöld's death, the manuscript of *Vagmarken* (Markings) was found in his house together with an undated letter to his friend, Leif Belfrage. One statement is noteworthy. Talking about his diary, Hammarskjöld remarked, 'These entries provide the only true "profile" that can be drawn.'

When the diary was readied for publication, the poet W.H. Auden, who had been invited to contribute a Foreword, wrote: 'Had the responsibility for the decision to publish the diary been mine, I should have been inclined to omit his covering letter to Leif Belfrage on account of one sentence in it which seems to me both false and misleading: "These entries give the only correct profile that can be drawn."... No man can draw his own "profile" correctly because, as Thoreau said: "It is as hard to see oneself as to look backwards without turning around." The truth is that our friends – and our enemies – always know us better than we know ourselves.'

A search for true identity is an unending one. Human beings have often been compared to onions – peel away a layer and you encounter another, both similar and different to the one discarded. At the end, all one is left with is a lingering smell, and tears in the eye.

What is true of individuals, is even more so for societies. Even if a society sees itself as a civilization with a defined core, what this essence is, who defines and certifies it, and what use this definition/self-definition is put to, is more a reflection of contending ideas and ideologies than any epistemic truth. This tension is most marked in a civilizational culture in transition like India, 'where cultural memories have been preserved with more loyalty and steadfastness than almost anywhere in the world. The beginnings of Indian life are coeval with the birth of human civilization as such, and ensuing centuries and millennia have witnessed not so much radical reversals as a process of accretion and a steady proliferation of cultural strands.'

It is equally true that the Indian sub-continent has been touched pervasively, perhaps more than other parts of Asia, by the inroads of western colonialism and political-economic hegemony. It is this conflict of

tradition and modernity, as reflected in India's encounter with the West, which forms the subject matter of the anthology under review.

Not that such an exercise is a particularly original one. There is no shortage of scholarly studies on the theme. What, however, has been less explored are the existential dimensions of this encounter, 'its role as a catalyst in a process of self-scrutiny and in the search for self-rule and cultural identity.' As such, the narrative presented 'represents not an objective travelogue but a sentimental journey as experienced by leading participants in the encounter.'

Part of the problematic has been framed by a concern that the Indian self-image has been shaped, if not constructed, by the westerner's image of India and the Indians. As a challenge to the western privilege to investigate, understand, and come to know the 'other', this anthology explores Indian perceptions and interpretations of the West, 'perceptions which inevitably were linked with, or rebounded on, modes of Indian self-understanding and self-definition.'

As in any other old civilization, the encounter was as much cultural as political and economic. Readers may possibly be familiar with John Keay's *India Discovered*, a book which traces the varying and growing appreciation of Indian culture by the English. Their early reactions moved from open-eyed amazement to dismay, from India as a fabled land of riches to one of a dark continent. It was only much later that there grew an appreciation of an ancient civilization in all its complexity.

The Indian journey follows a similar trajectory, from an uncritical adulation of all that is western to a near pathological defence of our ancient greatness – and the myriad shades in between. Dallmayr and Devi, following the Bhikhu Parekh four-fold classification of tradition, modernity, critical traditionalism and critical modernity, select for representation two sets of Indian intellectuals and leaders – one responding to colonialism and the latter to modernization.

The first set of thinkers – from Swami Vivekananda to Jawaharlal Nehru – encompassing Tagore, Sri Aurobindo, Coomaraswamy, Savarkar, Krishnamurthy, M.N. Roy, Ambedkar, Iqbal, Azad and Gandhi – brilliantly capture the remarkably flexible, differentiated and open-ended conception of Indian identity. Those enamoured of an Indian essentialism (read Hindutva) would gain from this expression untainted by chauvinistic arrogance and self-indulgence. Yes, the tensions between not just the traditionalists and modernists, but even their critical

variants were marked. Even those who advocated similar policies and institutions did so for very different reasons. While the critical traditionalists, *a la* Vivekananda, sought to eliminate what they saw as evil, the critical modernists sought to preserve what they saw as valuable.

This collection also helps in understanding the different strands of what today has become a defining problem – communalism. Each of the 12 thinkers, Hindu, Muslim and agnostic (M.N. Roy, Nehru), can be seen as a legitimate forbear to the current arguments on true and pseudo secularism, on the role of religion in civic life. Interestingly, even Savarkar, seen as the father of Hindutva, remained a non-believer in personal life, as also an unremitting opponent of a theocratic state.

The second part of the book, also comprising of 12 essays, is somewhat less eclectic, veering more towards the editors' personal predilection – critical traditionalism. It does, however, have the merit of political correctness – two of the essays are by women scholars. What makes this set come alive is the essay by U.R. Anantha Murthy, 'Why Not Worship in the Nude'. Alongside the extract from Sudhir Chandra's *The Oppressive Present*, it foregrounds the ambivalence that the middle class, urban, male, part westernised Indian suffers about himself and his society. Without falling into the trap of post-modernist relativism, it reflects the tensions in exercising an ethical choice when encountering beliefs different from one's own. Anantha Murthy's personal choice seems clear; he is merely hesitant about passing a judgement on others.

The golden jubilee of Indian independence, now drawing to a close, has resulted in many an offering. Most are critical, evaluative assessments of the post-independence Indian enterprise. The merit of this exercise is that it makes us more aware of our longer intellectual history. I also believe that it will better equip us to confront the different essentialisms parading as truth. It may even help us acquire a greater degree of reflexivity and self-confidence. If so, its purpose would have been well served.

**MODERNITY AT LARGE: Cultural Dimensions of Globalization** by Arjun Appadurai. Oxford University Press, Delhi, 1997.

MORE than two centuries ago Kant in his essay on *Aufklärung* attempted to strike a balance between public and private use of reason in the hope that one day it

would actually be accomplished. On such a hope rested the edifice of Enlightenment modernity. However, in recent times the universalist claims of modernity and its self-definition appear jaded and incoherent.

There are various vantage points from which modernity is interrogated today. Central to the interrogation of 'western modernity' is the proposition that there are different modernities whose history cannot be written, as had been done in the past, as an unproblematic victory of 'reason' over 'tradition', science over superstitions and so on. This critique has become trenchant and powerful, particularly from the theoreticians of modernity's victims or subalterns. How do we understand modernity today? What has been the impact of recent changes on modernity? Have we entered a distinct phase or era which could be called postmodern (post in the sense of after)? What does modernity mean for people once colonised? How do the modernities at different places the world over look like today?

Arjun Appadurai's book attempts both to frame as well as answer some of these questions. He attempts to build his arguments through the explorations of themes such as cricket in the Indian subcontinent, the centrality of counting in the colonial imagination, autobiographical fragments, and contours of national and postnational imaginary. However, the main focus of his work rests on the understanding of modernities at the present conjuncture, what he calls the 'here and now'.

For many, 'globalization' (interpreted in an evolutionist fashion) captures the essence of our changing times. But for the author, the present conjuncture is conceived in terms of breaks or ruptures. The changing nature of media and migration have become the cause as well as the consequence of the ruptures. The expansion of electronic media and the growing movement of people across the world, according to Appadurai, have transformed the ways in which people conceive their subjectivities and political imaginings.

In the first section of the book the author invites us to see the implications of a rapidly changing world of anthropology and cultural studies. If the world has become truly global then our understanding of territoriality, of academic disciplines, as the author rightly argues, is bound to change. This in turn implies that our 'methodological gestures' should also adapt to these changes. For instance, the phenomenon of consumerism can neither be understood exclusively within the confines of a given, bounded territory of a society

nor, with the help of state-centric methodology. At the centre of Appadurai's understanding of globalization lies the process of contestation, conflict and complex negotiations in and across societies.

The chapter on Indian cricket highlights this well. This is primarily a story of the indigenization of Indian cricket. However, this process was particularly complex. First, the colonial context inextricably linked Indian cricket to the politics of empire and then to the assertive world of nationalism; and second, the appropriation of cricket (its 'hard' cultural form as the author puts it) involved not merely knowing the rules but breaking and reinterpreting the link between the game and its embodied values. If cricket is a 'hard' cultural form then how did it change and become a source of so much passion in the Indian subcontinent? How did Victorian values, the Britishness, so strongly associated with cricket, get disentangled?

According to the author the indigenization of cricket in the subcontinent was a product of 'collective and spectacular experiments with modernity.' Beginning with the colonial officials, the little *rajahs*, and the indigenous religious communities, cricket gradually moved into the realm of a growing nationalist imaginary. Cricket, like so many other practices, showed to the nationalists the unacceptable face of colonialism and generated among the colonised a desire to beat the colonisers at their own game. Playing the game, however, involved learning the codes, rules and associated values. It was the colonial context that made this learning or imbibing the rules an ambivalent affair. Appadurai has indeed captured this ambivalence well. How did it all happen? Was it the vernacularization of cricket, combined with the expansion of media, which caused this 'hard cultural form' to melt?

There is no doubt that the media, both print and electronic, played a crucial role in this process. However, the proposition that it was through the media that people came to know cricketing codes which led to the popularity of the game does not carry much weight. It is perhaps plausible that a series of events or changes such as the decline of Indian hockey, the victory in World Cup cricket in 1983, and the expansion of electronic media during and after the Asian games of 1982, contributed to the changing status of cricket in India. Equally, I am not sure if the conversation between a Hindi commentator and Lala Amarnath, as suggested by the author, projects the hybridity of language and hazards of its use. To use the inadequacy of an ill-informed commentator to make a larger argument seems to me to be stretching the point too far.

The popularity of cricket in the country does not mean that an ordinary, but passionate, lover of the game knows the difference between a googly and a chinaman. The real consequence and index of vernacularization of cricket in India is that, for the ordinary spectators, the game has finally been wrenched away from its Victorian roots. Cricket has truly become a game of the soil. In this transformation, as the author rightly points out, the indigenization of patronage, state support and commercial interests have played a significant role. Finally, cricket's capacity to rouse passion is based on its ability to experiment with what Appadurai calls the 'means of modernity'.

Modernity is not merely about control and subjugation. It is also about contestation and coping. Appadurai has shown how, through an understanding of the colonial state's policy of classification and enumeration, the project of colonialism and the opposition it faced from the colonial subjects was imbricated. The colonial state's orientalist gaze was to a large extent responsible for creating new discourses on community. However, the implications of such discourses were not fully under its control. They moved in various uncharted directions and shaped the subjectivities of the colonised, which in turn gave rise to mobilizational politics of several kinds.

An understanding of mobilizational politics, both ethnic and national, constitutes the subject matter of the last three chapters of the book. Appadurai's insights are truly incisive and his suggestions full of theoretical possibilities. His critique of primordial understanding of ethnic mobilization is all too familiar. However, his use of the metaphor of 'implosion' to capture the ethnic mobilization in recent times is extremely useful. The role of migration and the global reach of the media, according to him, has transformed the older form of ethnic politics, once territorial and anchored within the nation, to a mobilization which is fluid, shifting and diasporic.

The most provocative part of the argument lies in his prognosis of the nation state. For some time now, scholars of globalization have talked about the decline of the nation state. Appadurai's book lifts this general understanding to a higher methodological level so that social science can devise ways of facing the new realities. One might disagree with his prediction that the nation state is on its death bed, but his invitation to ponder over post national ways of thinking and living is indeed salutary.

Not long ago, while reflecting on Kant's *Aufkklärung*, Foucault had advised that we free our-

selves from the intellectual blackmail of 'being for or against the Enlightenment'. This makes our understanding of modernities (even in its postmodern variant) adequately historical, nuanced and complex. Appadurai's work is certainly informed by this Foucauldian spirit. It is evident that this spirit will touch even those readers who do not belong to the author's discipline.

**CROSSING BOUNDARIES** edited by Geeti Sen.  
Orient Longman, Delhi, 1997.

THIS book carries around two dozen articles, poems and interviews which may, at first sight, seem diffused. But the editorial purpose behind them is clear: to bring into focus the cultural heritage that Pakistan and India on the one hand, and India and Bangladesh on the other, share with each other.

This point can be made in a perfunctory way, in the sense that it is not unusual for neighbouring nations to share styles, forms and fashions. But a claim becomes serious when it refers to basic emotional amenities like language, idiom, music, poetry and sculpture. It becomes even more serious when the effort is to demonstrate that this sharing is as intense today as ever before.

It may appear unfair to reduce a broad range of essays on language, artistic patronage, theatre, painting, folk music, epics and urban milieus to a simple proposition. But it would be even more unfair to turn one's back on a conclusion that Pakistan, India and Bangladesh continue to share a large cultural continuum, and this sharing cannot be seen as a matter that belongs to history. This may be a trite proposition as long as one is commenting on cultural affairs. But the moment one formulates it in political terms, it has serious implications. It implies that the origin of the hatred across the borders lie precisely in the territory of cultural intimacy.

The one problem with discussions on cultural overlaps is their political naiveté. Discussing cultural sameness is not the same as waving a white peace flag. It could well mean exactly the opposite. Politicians across the border are the only ones who understand this and manipulate it to their advantage. As the generations that directly witnessed Partition retire from power, the unique relationships in this subcontinent are likely to unravel. After all, where in the world do we have two prime ministers who

were born in each others countries (Nawaz Sharif, I.K. Gujral).

Having said this, let us start with the intimate, personal issues. The two memoirs in the collection by Intizar Husain and Nirmal Sengupta express deep fondness for the neighbouring country. Indians visiting Pakistan, and *vice versa*, genuinely feel as if they have found the lost love of childhood. But there is a refreshingly candid piece by F.S. Aijazuddin from Pakistan who feels nauseated by an Indian who approaches him on the streets of Paris with a whining familiarity. The editor deserves to be complimented for the inclusion of this stark essay which rescues the volume from the wishy-washy euphoria of naive peace lovers. Friendships between neighbouring nations cannot be brought about by assertions of cultural sameness, but through a political will than can create a distant respect for each other. Too much hugging is rarely a correct diplomatic move.

This volume is divided into sections which make place for memoirs, literature and the arts, questions of nation-building, and of course the inevitable matter of national identity. There is a particularly rich section on music, which provides a coherent picture of folk culture on our western, as well as the eastern flanks. Rakshat Puri's article on Bulle Shah and Muchkund Dubey's account of Lalan Fakir take us to the dense interwoven cultural mosaic of the countryside, in Punjab and Bengal respectively. Both are evocative pieces which open up a huge but invisible territory of culture. Admittedly, the section on music brings out a feeling of howling, desperate intimacy across the boundaries of politics. It outlines the index of emotions which are often transformed into political hostility in the region. It is matter of relief that despite this occasional intensity, there is much in the book that a lay reader will enjoy.

This volume also provides interesting insights into the question of gender in Pakistan and Bangladesh. Salima Hashmi discusses the fate of women artists in Pakistan while Meghna Guhathakurta focuses on Bangladeshi theatre. This is probably the right moment to express disgust for our perpetual media focus on Europe and America, while we know so little about our immediate neighbours.

To conclude, this book deserves praise for its get up and lack of errors. If we can publish such books in Pakistan, India and Bangladesh, we need not make bombs just to feel proud.

**Ratnakar Tripathy.**

**INDIAN MANSIONS: A Social History of the Haveli** by Sarah Tillotson. Orient Longman, Delhi, 1998.

THE traditional Indian dwelling was born out of the dual and contradictory rituals of community and privacy. The strengths of the community, its bonds of kinship, its family ties, caste and professional affiliations created requisite proximities and distances in domestic architecture. If in the village leather workers lived in enclaves separate from weavers and masons it was to maintain a wider protective and self-perpetuating network than the family could offer. They knew that if the community perished, so would the individual. In the city, community boundaries were a similar necessity in the past; but they appeared in more complex layers – habitable overlays that stemmed from intricate relationships between the urban setting and the society that inhabited it.

Sarah Tillotson's book *Indian Mansions* is a record of the life and times that created these urban settings. For sheer magnitude and mess of architectural material, there is little to upstage the history of the Indian house. Hindu and Muslim houses have been recorded all the way across the North Indian plains from Kutch to Calcutta, in vastly differing geographical terrains and cultural contexts and with a baffling variety of designs that defy easy categorization. Yet, Tillotson's book is a sanely lucid account of this architectural madness. Right at the start she admits that the only logic to analysing the material lay in discovering some common cultural thread. It is here that the exceptions begin to follow a rule, and a discovery made that the similarities between buildings lie not in their design or appearance but in the life they generate within.

It is indeed a valid, though anti-classical, approach to analysing a building's plan. In pushing architecture to the background, Tillotson's uses sociological data – the position of women in a household, recollections of those who have lived in havelis, even entries from Emperor Babur's diaries – to describe the way a house was laid out. Her concerns throughout the book, consequently, are with the architectural details and components of buildings: the *baithak*, the *gharokha*, the *chowk*, the *zenana*, the reception, the drawing room, the *tehkhanas* and other elements that emerge as a result of these cultural and historical investigations. Little of entire buildings or their urban settings makes its way into the narrative. Though compressed, the vast time span, and the variety and

historical spread of the material makes the text a heavily footed version of the subject.

The book begins 'under the cover of darkness'; the absence of light, and consequently building detail, allows Tillotson the freedom to describe the type of people that inhabited the haveli – the rich merchants of Gujarat and Rajasthan, the noblemen of the royal Mughal courts, feudal landlords and ordinary people. In so doing she brings together a range of house types – as varied as the *mohallas* of Shahjahanabad, the *pols* of Ahmedabad, the intricate *havelis* of Shekhavati and Bikaner. Inside, the simple actions of sitting and relaxing assume a variety of architectural import in differing cultural terrains. The name given to the principal sitting room is itself an indication of the importance each place attaches to it: 'The Shekhavati rooms were known simply as *baithaks* – sitting rooms; the first floor reception rooms of Rajasthan were known locally as *mahals*; Urdu speakers in Mughal cities referred to *dalans*, literally verandahs; and the great hall of feudal landowners were known as *diwankhanas* – audience halls – like their grander relations in the palaces.'

As the author points out, certain regional characteristics are also common to the courtyard houses of North India. The havelis also enclosed courtyards, a chowk, or an *angan*, within the house. This piece of appropriated ground was remade within the closure of walls and was intensively used as the setting for a whole range of daily rituals. The specific requirements of the family centered each house around its own private courtyard, a central open focus that did for it what the verandah had done for bungalow: venting the hot air and keeping the inside cool. The walls of the rooms around it were always enveloped in a pocket of shadow, cast by the high walls of the courtyard. Such a house, because of the excessive layers, did little to affect the climatic advantages that could have been achieved by orientation. And though such a heavy construction, and the building of rooms with no direct measurable function, had obvious implications of expense, the need for climatic and cultural protection necessitated this grand design.

While the need for security articulated the plan of the mansions, the house answered to family requirements in other, more familiar ways: the plan provided convenient slices of privacy. The courtyard separated the sexes – the men occupying the front rooms enjoyed the public face of the house, while the women were relegated to the background, busy in the activities of nurturing a household. Up above, the family bedrooms

and work areas functioned in a more relaxed privacy, removed from the prying eyes of the public street, and the badgering and voluble exchanges within the internal courts below. A muted light drifted through bracketed windows into this quieter and more private life. An innate resourcefulness and sense of conservation, the perpetual fear of security and the scarcity; and indeed the need for a harmonious family life, made the traditional mansion an internal cloister of habitation too complex to be considered in purely architectural terms.

In our own time, the diversity of the modern city – its varieties of family ties, economic status, peer groups and political affiliations have produced an unfortunate corollary to the traditional collective. At least in Delhi. The banding together of individuals imparts its own unmistakable public stamp of identification: journalists live in a landlocked sub-division called Press Enclave, lawyers do the same in Niti Bagh. A settlement of Punjabis creates Punjabi Bagh, Swamis band together in Swami Nagar, the Bengalis carve out their own in Chittaranjan Park. (By contrast Bangalore's more egalitarian city structure is perhaps reflected in its nameless addresses: Fourth Main, Third Cross, Seventh Road....)

In architecture the reasons for such affiliations are, of course, largely bureaucratic, and the individual – whether lawyer, Punjabi or swami – is forced into a collective in order to exercise his rights, buy land, build and live. Yet nothing of the architecture of these urban collectives reflects anything of the community that inhabits it. If the traditional city mansion attracted, it did so without giving away its secrets; the private courtyard life lay hidden behind a common vocabulary of street embellishment – carved balconies and elaborate doorways. The newer constructions of the cities, however, revel in the misconception that every house done in a personal style will produce a rich and interesting streetscape. Yet that is rarely so. The architectural expression that emerges outside ignores the architectural expression of its neighbour; a Baroque house shares a wall with a villa modelled on an Italian country house, which in turn shoves up against a Spanish hacienda. Such individualistic efforts are not only irresponsible from an urban standpoint, but reveal a superficial understanding of individuality. An ideology that encourages self-expression over cooperation, paradoxically produces an incoherent and monotonous architecture.

**Gautam Bhatia**

# Comment:

## Between warmongers and peacemakers

THERE are those who are for the bomb and those against it. They reveal themselves, as each seems to be sure of respectability. Those for rely confidently on intellectual demonstration, those against on a ready recipe of morality which demands no proof. I call the two factions warmongers and peacemakers for convenience, to identify them quickly by fixing the nature of the distortion rather than from a taste for caricature.

It is possible that those talking peace will lead us to war; that those talking war know best how to ensure peace. The warmongers may not be what they seem to be. This is often said about peacemakers; as they have been seen occasionally to lead to disaster, mostly through appeasement. We need the bomb, or the ability to use nuclear energy, for defence. The fault of the warmongers is that they do not explain why. They think everyone knows, and incomprehension grows by the day, along with hardening suspicion of bad faith or of congenital belligerence.

The words in use do not facilitate comprehension and feed debate. An example is deterrence. This is rarely explained.<sup>1</sup> Clearly the bomb will not deter any-

1. Problems of speech and semantics vitiate debate. Concepts such as deterrence are worn out, thus divorced in their semantics from their original meaning. Problems of speech may be more acute, as the vocabulary in use should carefully distinguish between internal and external use, and, further, between party and political use. Failure to make the requisite distinctions creates serious misunderstanding. The extravagantly noisy vocabulary with which the tests were hailed inside the country seemed to mislead the outside world about India's motivations. It provided a fervently aggressive tone. It removed from them their dimension of measured self-defence in the face of an increasingly untenable security risk. It diverted attention from a surreptitious and collusive nuclear weapons programme in the vicinity which evaded controls. The impunity that this programme enjoyed came from an accommodating posture on the part of the guardians of the new covenants that are designed to restrict proliferation.

thing other than another bomb. It will not deter infiltration, low level war, guerrilla movement, religious subversion. Unfortunately, it will not deter conventional warfare either.

So why do we need it? Easy. If only reality is invoked and demonstrated, for instance, by looking at an entirely probable scene. You are at war. It is not inconceivable to make the likely assumption that the war has been imposed on you by aggression, or by the adventurism of which we had a taste in the past. (For the purpose of its credibility, the logic may be applied to a supposed battle initiated by your side, so that there is no undue claim to superior morality.) The other side is not doing well, or at least is in the process of failing in its battlefield objectives; the momentum is against the other side, and accelerating. But it has the bomb and you don't. It will threaten to use it. Of course it may not. Can you take the risk and keep on fighting?<sup>2</sup>

The decision is difficult. You may have to call off the campaign. Or the balance has moved so far in your favour that the other side will not only threaten, it will use the bomb, it will drop it on you, on your cities or on your forces. You cannot deter it, neither the threat nor the use. The only way you can deter its use is by surrender, or by having the bomb yourself. It is hardly ever said that if one does not have the bomb then the only deterrent is surrender. This could make people sit up and, for once, take notice. The whole demonstration is starkly simple.

2. Here let us note that it does not matter who has initiated the fighting, so that we rise above the pedantry that invokes virtue for strategic planning. Virtue is imperative, but irrelevant. The power of the argument is enhanced by allowing for the hypothesis that you may yourself be the aggressor.

This said, the recent bombs have changed nothing, or very little. This depends on if we have been telling the truth on two vital subjects. Do the Pakistanis have the bomb? The tests do not in themselves logically mean that they, or us, either has the bomb. Tests are a means to making the bomb, they are not in themselves a bomb. If they, the Pakistanis, do have a bomb or several, we had to do what was necessary to allow ourselves to develop one, or several. If they already had the bomb, the situation today is better for us than before, presuming that the tests will allow us to make one ourselves. The logic nevertheless gives them, at least for the present, the advantage, simply because they have been ahead.

This brings us to the other subject which we must verify if we have been telling the truth. We have always claimed that we do not have the bomb. This is, it needs clarifying straight away, quite different from Pakistani protestations. They have not been consistent in saying that they do not have a bomb, that they have shown restraint since 1974, that they have felt threatened by India's nuclear capability. On the contrary, they have on several occasions, and through the testimony of their highest authorities, admitted that they do have the bomb. There is other evidence to suggest that this is true. American agencies have presented a convincing case. China has clearly helped Pakistan. No one has helped India; not even the most ardent critics of the Indian nuclear programme say to the contrary.

If we have been telling the truth, then it was necessary that we start the process of making the bomb. We may have some catching up to do but we are in a better situation today. Matters are out in the open. We assume that the Pakistanis have the bomb. The procedure to arrive at this conclusion is not important. They could have been helped by China in several ways; it is not necessary to speculate how. They have recently tested a long range delivery system which threatens India seriously. If we did not have the bomb, and if testing through explosions is necessary to develop one, then we are now better off.

Let us deal with the proposition that we have been telling the truth. There is no reason to think that India has been lying. We are not good at it, notably because we cannot keep secrets, and are prone to leaks.<sup>3</sup> So it was dangerous to allow the situation to endure, and our disadvantages to mount, while we festered in inaction.

3. Some will object by invoking the legend, which is in the making, that the Indian scientists managed to dupe everyone and that the tests we conducted covered the American agencies in the mud of mortification. I am not quite sure about this. It might be that the

If we have been lying then nothing much has changed. But we are still better off, because the essential equilibrium is now visible and thus not open to errors of speculation. It is very dangerous to be faced with a foe who is schooled in deception and skilled in ruse. Inertia can cause one to languish in illusion and complacency.

If therefore, and returning to the solid ground of logic, we have been telling the truth, then the Pakistanis are a little ahead of us, but we are doing what we can to catch up. This is incontrovertible.

While the facts regarding the nuclear balance are quite clear and amenable to coherent reasoning, there have perhaps been deficiencies in the internal management of the issue and the external diplomacy designed to attenuate international reactions.

The bomb is not equivalent to virility. There is in recent international negotiation gathering pressure on nuclear proliferation. There is no reason to presume that the government acted out of political expediency. The party in power has always said that it was going to make India nuclear. Other parties have found irresistible claims to have initiated, or continued, or supported, or strengthened the programme of nuclear development, while indulging in expedient and unprincipled criticism of the government for having done what they said they might themselves have done or claim they nearly did, but which, in the hands of this government, naturally became opportunistic or immoral or dangerous.

This contradiction is evident in the attitudes and statements of the political formations that matter. The parties not in power cannot both say that they have supported the nuclear weapon programme while they were in power, and that the party now in power has made a mess of things by taking it along the path that was already drawn. This is hedging bets in the extreme, a ploy aimed at exploiting the outcome of the explosions, irrespective of the trend of opinion and the course of politics.

Nevertheless India cannot treat the explosions as a purely internal subject. To be fair, it is possible that

Americans knew what was happening and, for motives that will need to be analysed in time, chose not to do anything; nor indeed to reveal that they knew. It should occur to someone that it would have been discomfiting for them to admit that they had the information on Indian preparations to test but did not want, or could not do anything to counter them. Any number of motivations, many of Machiavellian inspiration or of prejudicial intent, could be assigned to explain American dissimulation. At worst it could have been an attempted trap. This may, admittedly, seem fanciful now; especially in intellectual circles that wrongly deny to the Americans the considerable sophistication and skill that the hypothesis implies.

it did so in anticipation of sanctions and the threats and pressures that did not take long to emerge. It might have felt the need to bolster morale, to shore up support, correctly anticipating that the opposition would try to make the most of the opportunity to embarrass the government since the nuclear issue is intrinsically emotive and leads straight to consternation and reprobation.

Even so, we did succumb to a measure of jubilation. No doubt this was partly because the scientists were excited, unable to contain their delight.

But a nuclear test is not the occasion to celebrate a blossoming scientific feat, or proclaim a heroic national triumph, or trumpet a long denied collective birthright. Since the science of nuclear explosions is now commonplace, the accent on self-satisfaction, jubilation and glee was misplaced, exacerbated by braggadocio. To some degree the defiant stance signalled in the direction of Pakistan was understandable. It has been meddling in Kashmir, pursuing a clandestine nuclear arms programme under a great veil of subterfuge, and attempting to construct an arc of hostility around us. The spate of declarations by responsible quarters in India has to be understood in terms of the politics of the country and also as a sign of the frustration which low level wars and infiltration invariably create.

But we do have to look beyond immediate political compulsions. It can be argued that management of the matter should have been predominantly external rather than internal.

There has been failure in preparing opinion. The country has followed, but more from instinct and a natural patriotic urge. The explosions over, the tone should have been grave rather than self-righteous and self-congratulatory. Much has been said about the statements made by the Minister of Defence some time before the tests. Retrospectively, the government has been credited with the design to prepare the public, a design of which it might in fact have been totally innocent. Too much need not be made of the statement made by the minister and the speculation which saw in it either government's confusion or its artful manipulation.

After the tests we should have made clear why we had been forced to carry them out. We should also have reiterated our continuing commitment to denuclearisation as the essential step without which disarmament is either impossible or meaningless.

The emphasis in what we say need not be that we have become a member of the group of nuclear

powers, ready to share in the privileges that this confers and hungry for the impunity with which they can shrug off opinion. We cannot behave like candidates to a club which we deplored until we could join it and conduct ourselves in the same reprehensible ways which has made its members notorious.

We could have said something along these lines: We announce with great regret that we have been compelled by circumstances to proceed to nuclear tests. The regret that we feel is all the greater in view of the consistent position which we have taken in favour of disarmament, particularly nuclear disarmament and nuclear testing. We have been driven to the decision because of the development of nuclear weapons in our region, by powers who might be tempted to use them against us or threaten to do so. The recent development of nuclear and delivery capabilities added urgency to our security concerns... and so on. It would have been salutary to rededicate ourselves to the objectives of denuclearisation and disarmament.

There have been altogether too many statements on 'weaponisation'; assertions that we did not for once claim to have conducted what came to be called a PNE (peaceful nuclear explosion); claims to a new status as a member of the nuclear club, and so on. The brutal reality is that, and always on the assumption that we have been telling the truth, it will take us some time to become a full nuclear weapons power. This requires industrial depth and considerable capital outlay, not furtive assembly lines that can be hidden from a curious world and an anxious nation.

A coherent and lucid public information campaign is essential for full and objective understanding of the tests. The absence of such a campaign does not necessarily constitute a fatal indictment of the government. It should be admitted that in matters of public policy there is an institutional weakness inherent in the system. In spite of Parliament and its enquiries and questions, searching or ritualistic, the habit of sharing information has not really taken root. This is deeply incompatible with democratic habit and style. Democratic habit and style are more than just trappings. They are designed for the public interest.

The sharing of information entails wide participation, the necessary condition for the contribution to debate on intelligence in the system. This leads to the fertilisation of policy-making. Policy cannot be made only in the corridors and antechambers of power, where the bureaucracy holds sway. Second, apart from the need for all the intelligence in the system, politics requires openness in debate, the admission of dissent.

Finally, information sharing is the ultimate weapon against the functionary. Secrecy is his final defence against examination. He wants protection against possible exposure of his weaknesses.

When information is not shared, and this is quite apart from the legitimate dictates of secrecy, there can be no effective defence of public policy, and no genuine guarantee of the quality of public policy. The strength of democracy is precisely that it gives you popular sanction for policy. This is what the mandate of the people is about. The civil servant can be insensitive to interrogation and thus unwittingly irrigates the suspicion that he undermines the public interest, the very thing that he is employed to serve.

A word about China, which lurks furtively in the shadow of all that is being said about the nuclear programme and its rationale. Even if the defence ministry of the party in power sought credibility in invoking the nuclear status of China as the reason for our programme, it was invariably Pakistan which lurched into the open at every step. First, because any statement, explicit or unintended or implied which ensnared China seemed illusory. It is true that China has made Pakistan a nuclear power – the evidence for that is no longer disputed – but the preoccupation with Pakistan could not be camouflaged.

It is still necessary to define a policy regarding China and the security implications of its nuclear and military preponderance in the region. We do need a weapon to deter China were it to be tempted to use nuclear blackmail, simply because it has a nuclear capability. This logic is only mechanical, but makes good sense. Nevertheless, we are far from achieving deterrence against China. For that we need the capability of mutually assured destruction. This remains distant.

China does indeed have the capability of massive destruction and prohibitive damage of Indian targets because it has a well developed arsenal, one that was developed with one, and even two, of the superpowers in mind. It has enjoyed a nuclear weapons capability for decades and has developed intercontinental

4. The embarrassment for India when the French tests were announced might be recalled; as being not entirely unrelated to the issue in its entirety. The evening (13 June 1995) that French President Jacques Chirac announced the resumption of tests, the Indian Prime Minister was on an official visit in France. Curiously the announcement was made by the French President at the very moment when the French Prime Minister, in the course of his welcoming banquet speech, was upbraiding his guest for India's nuclear policy, particularly with regard to non-proliferation. The irony was not lost on observers. Some even saw the incident as an affront.

delivery vehicles. For the Indian reach, China is too vast a land and this country's nuclear and missile capabilities are no match. All we can hope for is the ability to inflict serious damage, with a substantial degree of pain, if China launches a nuclear attack. This can be taken as axiomatic by planners who are hardheaded, without illusions about the peaceful professions of neighbours.

The deficiency in diplomacy and public opinion management following the explosions has been relative. But there is no doubt that the decision itself and its execution were exemplary. First, the uncharacteristic secrecy has been encouraging. We are discovering a new quality in ourselves, leaving aside possible American disingenuousness.

A comparison can be made with the pain that the French inflicted on themselves when they announced their last series of tests.<sup>4</sup> One can compare the careful stage-setting of the last set of French tests with the suddenness of the Indian ones. The Indians did not announce the tests; they carried them out. They did not talk about a series, and then compress the timing because of diplomatic embarrassment. They quite quickly and unexpectedly did two lots, and contrived some ambiguity about future testing. There was no inconsistency or change of policy.

Unlike the sharp turnaround after Mitterrand, who actually thought that he had bound France forever not to test, the BJP has always said it would make the country go nuclear. Moreover, India, across the political spectrum, has consistently rejected the non-proliferation approach. The French were ambiguous about testing; in India there is wide support for the act. The French nuclear force is designed for independence from allies; the Indian programme is aimed at enemies. This distinction is fundamental.

Finally, there is no point in engaging in debate on economic waste. The fundamentalist argument is that the money should be spent on the poor, in improving conditions of living, on education and the infrastructure. A thousand, and more, better uses for the money could be found. The argument can equally apply to tanks, artillery guns, fighter or bomber aircraft, less murderous bombs – which also kill. It is not clear how one sort of dying by explosives is better than another, the difference being the type of explosive. Life is like that. Money goes to all the wrong things. But we live in this world, with neighbours who do not descend to us from paradise.

# Backpage

PRIDE and glory. A redemption of national honour. A recovery of our lost manhood. So went the litany after the 'successful' explosions at Pokharan. What we need is a *shakti peeth* at the site, a symbol of our second, and 'true' independence. The dust of Pokharan should be taken around the country, *a la* the *Gangajal* pitchers during the *Ekatmata Yagna* in the early eighties and the Ram Mandir bricks a few years later. This, so the ideologues of the ruling dispensation inform us, is the route to a new and resurgent nationalism.

The euphoria may have subsided somewhat with the equally successful testing of nuclear devices by Pakistan a mere two weeks after the Indian explosions. But the machismo still lingers on, most markedly in the leaders of the Pokharan state, Rajasthan. After all, they now claim ownership of the new holy site.

Strange are the ways of the victors. Forget Alexander and his graciousness towards Porus. That was only a reflection of weakness, an absence of the much needed killer instinct. We, so goes the refrain, will ground our enemies into the dust.

Throughout this phase of a steady rise of atavistic nationalism and pride, the 'valorous' state of Rajasthan has been conducting a war on its women. The state is among the leaders, from the bottom, in every single index of gender equity and empowerment: abysmal literacy rates, a high incidence of infant mortality, stark inequality in gender disaggregated wage rates, widespread practice of female infanticide, and come *Akha Teej* – thousands of child marriages. But nothing reflects the true status of women in Rajasthan as the climbing graph of sexual violence. Rape, remember, is the time honoured right of the victors.

Earlier in the decade, the state was rocked by the sex scandal of Ajmer. Religious functionaries (one must confess to significant unease in the use of the term religious), along with petty businessmen, had for years successfully blackmailed young women into a sex racket. Expectedly, our bureaucrats and politicians were proverbially blind. At some stage the bubble burst. Given public outcry, individuals had to be charge-sheeted and tried. Recently, they were even convicted. But they cannot be jailed. The administration has been unable to locate and apprehend them.

A few years later, a similar scandal came to light in Alwar, this time involving important functionaries of the ruling party. Progress, none. The infamous

Bhanwari Bai rape, notwithstanding nation-wide protests and campaigns, fared no better. Why, the honourable court pronounced that the charge was fictitious. The learned judges found it difficult to comprehend how 'respectable' members of the upper castes could engage in such a defiling act, that too with a woman belonging to the lower orders. How indeed!

Rajasthan, remember, is the pioneer in women's development. It is another matter that this much touted programme is now floundering because the government is unable to decide what it should pay the *saathins* who are the backbone of the programme. It's a moot point that Bhanwari Bai too is a *saathin*, one who was rewarded for her labours in trying to put a stop to the practice of child marriage by rape.

Given such a glorious record, the latest 'incident' of the alleged gang rape of a young woman a second time around should not shock. But even in a state revelling in a Viagra induced, post-Pokharan rediscovery of its lost manhood, the brutal and calculated violence on a woman barely recovered from her earlier traumas cannot but force the residents of the state to hang their heads in shame. The object this time around was to unambiguously impress upon her who the real masters were. She, and her family, had the temerity to try and bring the perpetrators of the earlier crime to justice.

Of course, the various women's organisations protested, and vigorously. The National Commission for Women was quick on the scene. Not, however, the guardians of our public morality. The local media, swift in its sensationalising, added its usual dash of salacious gossip and innuendo. It was as if the woman had wished it upon herself.

The state leadership expectedly took its cue from the media. To the malicious disinformation campaign was added the damage limitation exercise in the form of a policy paper on women's development. Having done so, it turned its attention to more important affairs – strategising about the forthcoming elections.

The 'accused' roam around free. Their honour and pride remains intact. In a *weltenschaung* that places Roop Kanwar of Deorala alongside Padmini of Chittor, where *jauhar* is equated with forced *sati*, honour and pride are not easily dented. Shame is a far cry. We, after all, have the Bomb. What's a rape or two.

Harsh Sethi

### HALI'S MUSADDAS

The Flow and EBB of Islam

Christopher Shackle & Javed Majeed

Altaf Husain Hali's epic poem, the *Musaddas* (1879) on 'The Flow and Ebb of Urdu poetry. A key text for understanding the emergence of modern Indian literature, it is also crucial in gauging the response of South Asian Islam to European imperialism and modernity.

0 19 564091 8 1997 215 x 140 mm  
276 pp. Rs 395 A

### LUCKNOW

Memories of a City

Violette Graff (editor)

This book focuses on Lucknow and covers 250 years of its eventful history. It deals with the position Lucknow held in the panorama of Mughal politics; its rise to grandeur during the days of the nawabs; the trails and tribulations of its populace during the Mutiny and the conflicts which emerged as part of Lucknow's transformation into a colonial city.

0 19 563790 9 1997 215 x 140 mm 296 pp. Rs 475 A

### WHAT REALLY HAPPENED DURING THE MUTINY

A Day-by-day Account of the Major Events of 1857-1859 in India  
P.J.O. Taylor

This is the first book, ever, to produce a day-by-day account of the events of 1857-59. This book introduces the reader to the subject, points the way to further research and contains the most comprehensive (around one thousand monographs) checklist of published works, annotated and completely up to date.

This is 3 year old Shreya.  
Her parents abandoned her  
and vanished. If you turn the page,  
you'll do the same.

With no one left in the world, little  
Shreya doesn't have the slightest  
hope of facing the future, unless she  
gets an education. And that's where  
you come in. To make a dream called  
*Nanhi Kali* come true. Through  
*Nanhi Kali*, you can become the foster  
parent of a little girl like Shreya.  
By giving Rs. 100 a month towards  
her education, your 'daughter' will be  
put into school and in fact, you will  
receive regular reports about her  
progress including a photograph.  
*Nanhi Kali* is a special project of the  
K.C. Mahindra Education Trust - a  
Trust set up by one of the most  
reputed industrial families in India.  
A Trust that's been working since  
1953 to promote education and  
enlightenment across the country.  
Since *Nanhi Kali* literally means  
'little flower', with people like you,  
we hope to repair the broken  
petals of thousands of such  
underprivileged little girls.  
So please don't turn the page yet.  
Supported by M/s. Mahindra & Mahindra Ltd.

A smile. A teardrop. A raised eyebrow.  
A flare of the nostrils. A frown. These are  
just a few manifestations of a language  
that transcends the spoken word.

Spontaneously communicating  
feelings like ardour, agony, ecstasy,  
excitement, fervour, fright, passion and  
pain. All housed in the human body and  
triggered by amazing chemical reactions.

Devotion and dedication have enabled a  
handful to master the art of self-expression.  
Fostering it to perfection. In the visual arts,  
the performing arts, music and dance.

At Herdillia, we've also devoted  
over two decades perfecting  
chemical reactions, thereby elevating  
the quality of life. In homes, offices,  
industries and in agriculture.

It's our way of expressing underlying  
feelings. Like concern and care. Feelings that  
are an inherent part of Herdillia's chemistry.

Excitement, anxiety, agony  
and ecstasy -  
some amazing chemical  
reactions we all possess

Air India Building,  
Nariman Point, Mumbai 400 021

## The problem

*Some nights  
my eyes open  
and I think that  
those scientists who invented  
atomic weapons:  
when they heard the news of  
the terrible genocide of Hiroshima-Nagasaki,  
How did they sleep at night?  
Did they, for a second even,  
Get the feeling that what they had done  
Was not right?  
If so, then time will not put them in the dock.  
But if not then history will never  
Forgive them.*

— A.B. Vajpayee\*

INDIA goes nuclear, screamed the ecstatic headlines. The prime minister smiled, flashing a victory sign. Opinion polls reported an upbeat mood. The opposition was in disarray. This was mid-May, 1998.

Ten weeks after the 'successful' explosions at Pokhran, the absence of euphoria, even among those who celebrated 'the smile of Buddha' with sweets and crackers, is evident. The hype about our great scientific achievement; of having restored pride to an emasculated nation and in one fell swoop, of having altered

the global power balance, no longer dominates the media. Instead, what we witness is a desperate exercise of damage limitation, hopefully without losing face.

So why is it that after a quarter century of nuclear ambiguity we decided to gatecrash into the exclusive and 'immoral' club of the nuclear weapon states? Surely, not just because the BJP, leader in the ruling coalition, had never hidden its intention of exploding the bomb. Or that its tired old men, hamstrung by the unseemly wrangling in their political arrangements, were keen to demonstrate decisiveness. Or even that the bomb was expected to deliver significant domestic political advantages.

Central to the imagination of the nuclear advocates is the belief, mistaken, that the bomb implies power. The argument being that in an unequal world dominated by the P5 states, the route to our rightful place in the comity of nations is through ignoring the NPT and CTBT and forcing entry into 'the club'. Only then will the world take us seriously.

The pro-bombers have repeatedly asserted that we had no option, that continuing nuclear ambiguity offered no further advantages, that with the final dates for ratifying the CTBT fast approaching, the time to go overtly nuclear was now. It was further argued that our security environment had worsened, that given the speed with which Pakistan was developing its nuclear and missile programmes, ostensibly with *sub-rosa* help

\* 'The Pain of Hiroshima', in *My Fifty-one Poems*. Kitab Ghar, Delhi, 1995 (translated from Hindi).

from China and the US, the time for diplomatic initiatives was over.

There were claims about other potential benefits. One expectation was that having demonstrated our nuclear capacity we could successfully bargain for a permanent seat on the UN Security Council. Or that we could now, more meaningfully, settle outstanding issues with our neighbours. Even that this would reduce the possibility of war.

Critics have pointed out that the decision to go overtly nuclear was badly handled, particularly in the early display of jingoistic exuberance and a blasé unconcern about diplomatic fallouts. All that it managed was to provide Pakistan the 'justification' for its retaliatory testing. And the unnecessary targeting of China, that too in a badly drafted letter to Bill Clinton, only helped further consolidate the Pakistan-China axis. Our other neighbours, whatever their public pronouncements, cannot be pleased about N-bombs in their backyard. Even more because we were too foolish and arrogant in not immediately writing to them, allaying their fears and offering them a no nuclear use, no war pact.

Globally, both India and Pakistan have added to insecurity and increased the likelihood of nuclear proliferation. With the end of the Cold War and the break-up of the Soviet Union, the little progress that had been made towards denuclearisation has been pushed back.

To first focus on security and defence. Just how does a nuclearised sub-continent enhance our national or regional security? Nuclear neighbours, more so with a history of discord, make for an unstable brew. Unlike in the US-Soviet Union case, the time difference between any one side making a move and the other retaliating is so short that there is no possibility of consultation or withdrawal.

Realists argue that nuclear weapons are not for use but for deterrence, that the sole stated purpose of such weapons is to prevent their use. Strange logic. Just how does this rule out nuclear war? Ever heard of accidents, miscalculations, or madmen? The number of times the world has come close to exterminism is legion, all well recorded. But yet, we persist with the delusion. Finally, possession of nuclear weapons does nothing to reduce the likelihood of cross border infiltrations, low intensity conflict, or even conventional war. Baldly stated, we will not resolve Kashmir by going nuclear; all we have done is to successfully internationalise it.

By no account does going nuclear reduce our defence expenditures, already much too high for a poor country. If we total up the cost of the bomb (number/types), delivery mechanisms (missiles/aircrafts/submarines), surveillance systems, command and control mechanisms and all the associated paraphernalia required for a credible nuclear capability, only then do we realise what we have let ourselves in for, more so

since weapon systems require constant upgradation. The argument that 'national security recognises no costs' only contributes to taking the issue outside the purview of reasoned debate.

And then there are sanctions, an inevitable fall-out of the decision. We may put up a brave face, but there is no running away from the fact that they will hurt. It is not just reduced foreign investment, the abandoning of projects mid-way, or new restrictions on trade and aid – the harsh reality is that we have become an insecure destination, a high risk one. Couple this with high defence expenditures resulting in a re-allocation of resources away from production and welfare sectors, and the true costs start emerging.

Finally the slogan, *Jai Vigyan*. Why a 'successful' demonstration of a fifty year old technology should be touted as a remarkable achievement of Indian science appears bizarre. We may be entitled to satisfaction on a rare display of teamwork, on our ability (for once) to keep the decision secret, on successfully taking the US spy establishment by surprise, or even that, unlike Pakistan, our nuclear technology was purportedly *swadeshi*. But, as a scientific achievement, Pokhran II, though an advance on Pokhran I, is nothing to write home about. Far more distressing is the glorification of our science and scientists in developing weapons of mass destruction. And the fact that our senior scientists are willing, if not eager, accomplices in this deliberate erasure of potential holocaust.

It is insufficiently realized that the fuelling of our nuclear programme owes as much to our amoral scientists as our amoral politicians, across the spectrum. So excited are they with their nuclear experiments and toys, and the possibility of increased resources and accolades, that they seem to have forgotten even the pangs of conscience and guilt that afflicted those who worked on the Manhattan project, particularly after Hiroshima. Or that even when the war with Japan was conclusively won, the bomb was dropped at Nagasaki as part of a scientific experiment.

There is, whatever Raja Ramanna, the 'grandfather' of the Indian nuclear establishment might claim, *nothing* defensible about nuclear technology, even less the decision to weaponise. In the five decades since the technology first made its appearance, we have still not managed to reduce the hazards associated with the nuclear industry. Even as a mode of generating electricity, euphemistically called peaceful use of nuclear energy, it remains unsafe and uneconomical. As a weapons system, it is indiscriminate, not just between soldiers and civilians, but between present and future

generations. No wonder, the International Court of Justice at the Hague pronounced the use of nuclear weapons as violative of international humanitarian law. Incidentally, the Indian deposition on to the ICJ argued strongly for a complete ban on the use of nuclear weapons. And this as recently as 1996.

All nuclear establishments are secretive. They lie about the costs and the potential hazards associated with their profession. In most places, including India, they seek and secure relative autonomy from not just the public but political authority. Our atomic establishment has never been put through a public audit. You never come to know about cost over-runs, radiation leaks, cancer deaths, whatever. If anything, it is hyper sensitive to criticism, helping consolidate what Robert Jungk calls an Atom Staat.

Further, their internal drive to produce bigger, better, more destructive weapons leads them to devise new languages of risk, promise new possibilities of power – a combination that the political establishment finds difficult to resist. No wonder, for the first time we heard of the need for a military-industrial complex. And our Minister of Defence obliged by throwing open the Defence Research and Development Organisation (DRDO) to the private sector.

The real argument against the nuclear option is moral and ethical. Ashwatthama's use of the *brahmashtra* resulted in his *mani* being snatched away by Krishna. Being immortal, he was condemned to being a pariah in perpetuity, wandering somewhere in disgrace. A mindset that can reduce the possibility of total extermination to game theoretic scenarios of acceptable risk is evil and merits unilateral rejection. Let us not forget that both Brazil and Argentina called off the military part of their nuclear programmes once civilian rule was restored. So did South Africa after Nelson Mandela took over. So did Scandinavia, Germany and Japan. We do have precedents.

Living under the constant threat of extermination is hardly conducive to reasoned discourse. But that is what our respective ruling establishments have brought us to. The one silver lining is that many people, experts and lay citizens, have for once come out against the decision to overtly go nuclear, the plan to move from capability demonstration to weaponisation. And so is the case in Pakistan. Our rulers have started frantic damage limitation exercises. Possibly the usual South Asian inefficiency will be enough to thwart the grandiose plans. Maybe wisdom will finally prevail. This issue of *Seminar* is dedicated to this hope.

HARSH SETHI

# Scenarios in search of a bomb

SHIV VISVANATHAN

THE following drafts, found at the Mohan Singh Place coffee house in Delhi, were passed on to the CID by an informer. The notes were a great source of consternation and puzzlement. They were not the usual peacenik nonsense and what made them even more suspicious was that there was laughter in them. Early efforts to empirically evaluate the documents proved futile. When that didn't work, the extracts moved up the hierarchy, eventually landing up at the table of O.M., Deputy Director. O.M. read them, laughed and then turned thoughtful. The notes were 'as if' pieces, heuristics but extremely real and rather accurate. O.M. had only six months left in office and he was fed up with politicians and the bomb. He decided to add his bit of defiance and put the notes back into circulation.

Imagine yourself in the RSS office. Don't think of men in *khaki* shorts or shopkeepers with bulging stomachs. Think of a generation beyond the Savarkars and the old Arya Samajis with martial moustaches, raised on Tilak and Lajpat Rai. They are sitting around the table; men like Gurumurthy and Govindacharya. Tired of seeing India lose again and again. Thinking of India with its civilizational past and

its flaccid democratic present. An India of continuous defeats with a report card of B minuses.

These are nationalists who have projected their ego on to the state. The state as a persona, not the machine like state of socialism. Nor the effete state of Jawaharlal or the designer boutique state of Rajiv and Sonia. A state that is the ultimate Rorschach of a middle class desperate to be great. A middle class tired of socialism, happy to be consumers but desperate to share greatness and have a moment in history.

These are powerful men, actors who feel that the Indian state was withering away because it had no theory of greatness. They know that the BJP is a trend-setter by default, that the Congress and United Front are just weaker versions of it. The BJP has a clarity beyond their confusion, a clarity that combines both banality and greatness. The banality of consumerism and the heroism of the state. Their Archimedean equation: Markets and State power = Greatness. Better than Soviets+Electricity=Communism or the pseudo-secular 'dams and laboratories are the temples of modern India'.

They know that what India needs is an affable hybrid, something

nativist based on potboiler history and something global. Govindacharya tried to sum it up. Dabur + BARC = Success. They were looking for words, slogans, which could be both fixed and protean. Digital words, something disembodied and yet attractive enough for everyone to lay claim to them. They needed to convert weakness to strength. *Problem*: 900 million people is a demographic nightmare. *Solution*: 900 million people is a marketing dream. *Moral*: move from demography to consumerism.

Step II was simple. Appropriately the discourse of the other. Reclaim secularism from your opponents. That shifts attention from your communalism. Insist on the uniform civil code. That makes you as secular as the metric system. Now grab nationalism. Eat into your opponents' capital and insist yours is the only legacy left. Modernize through cinematisation *rathyatras*, but in Toyota cars. Provide the idea that you are modernizing your heritage. Paramilitarize the mind of a society so that everyone has the unconscious of a soldier salivating when the flag is up. Then change the meaning of the flag. Create a tutorial college nationalism.

**R**emember, citizenship should be Pavlovian and based on minimal myths: A great civilization. A nation whose time has come. The great modernizers. Project your leaders as archetypes. Advani as the modernized RSS. Rithambhara as the ascetic woman. Sushma Swaraj as the careful budget-balancing housewife. Vajpayee as the leader every Congressman wants. Pramod Mahajan as the eternal commerce graduate. Remember, commerce is the true university model. It has everything and nothing. Now if you want physics, let it wear an *angavastram* like Murli Manohar Joshi. Project him as the sage with new powers, the *rishi* with a Ph.D. degree,

at home in the Science Congress but relaxed in a *jagaran*.

Learn from the modern. From Wall Street. From Downing. From Madison Avenue. Remember propaganda should never be flat-footed. Advertising taught one that: Voting for the BJP is like starting a long affair with the nation. Offer dreams and utopias. Dreams for the individual consumer and utopias of a great state. Hybridize, but by absorbing the old. Result: BJP looks like the old Congress. Professor M.G.K. Menon thinks so. So does *India Today*. Hint that Indira, Rajiv and Sonia are aberrations. Project Vajpayee as the ethnic Nehru and Advani as the uncaged Patel.

Now you are set. You have made it to power, but with grace-marks. You have topped the university with 56%. You need 12 to 16 grace-marks. A middle class nightmare. A stigma one has to carry till the next exam:

**T**ough times, particularly when the girl next door has the mind of a Cleopatra and the physique of Big Bertha. Survival in politics becomes a three-legged race with her and you start stumbling and looking indecisive. What do you do? Simple. Hijack the legacy of earlier regimes, add *tadka* and present it as your own. What did India produce in the last 50 years? A nation, science and a confused middle class. What can rejuvenate all three? What can give the nation-state legitimacy, science, a purpose, and the middle classes a sense of euphoria and participation? Enter the Bomb. The bomb is inflatable ego, an inflatable raft; it is inflated science. It is a high, the Viagra for a tired India. Translated, *chyavanprash* in every mouth.

Phase II is not so easy. You have taken someone's play and signed as author. But the crowd loves it. You have delivered the lines that others were rehearsing. How does one pro-

ceed, mark one's way? One needs trial balloons.

Power to be power must remember its contiguity to the clown and the frontman. Remember you can think aloud through them. Remember they are dispensable, disposable. Enter Rangarajan Kumaramangalam and George Fernandes, ready to go where angels and the RSS fear to tread. Any pretext will do for these two. An informal interview. A business talk. Announce China is the real danger, which it is. Declare that nuclear power is good, clean Brahminic stuff, which it is not. Test the air with canaries that can also sing. Meanwhile the bombs are ready.

A sequence of them. Now you arrange them in a series which represents India. 50 years of Indian waffling, whining, ambiguity and hypocrisy fast-forwarded into clarity. First the simple Pokhran bomb of 1974 vintage. A reminder of our Indira Gandhian past. A salute to the Congress. Then a medium device, a bit like the UF. Then the hydrogen bomb to announce that the big boys (BJP) have arrived. Then two designer bombs, so that those in the know can smell the real touch of nuclear cuisine from aperitif to dessert. Bravo.

**E**very bomb needs two things: security to provide secrecy and a PRO agency to coordinate the aftermath of the announcement. Everyone should feel the bomb is theirs. India should stand prouder. But like the US dollar, there have to be twin messages. One must telegraph both money and power. To avoid or trim sanctions, one must speak the language of the market. Tell the world that India has a middle class, bigger than Europe. A consumer market that will make businessmen drool. It is our banal, maligned, unheroic middle class that comes to our rescue. Consumerism and the atom staat, i.e. consumerism

at the megaton level. You produce it; we will eat it – Coke. Basmati rice. Comics. Condoms. Music. Electricity. Pornography. Donald Duck. Chewing Gum. Chips. Food. Energy. Infrastructure. If the bomb makes us feel Indian, the middle class completes the Clintonization of India. No American is going to abort a market of that size.

Temporary outrage, why not? I will huff and puff and blow your house down. The happy hypocritical noise of politics. Remember the Olaf Palme strategy. Come to India to talk peace and quietly sell your Bofors guns. Peace and a bit of trade. Every *bania* understands it. So does every American and Japanese.

RSS Sutra-I

The H-bomb is a scientific experiment. The H-bomb is a thought experiment.

Equation-I: Consumer democracy + Statist jingoism = Globalization  
Equation-II: Swadeshi = McCarthyism + Kellogg Cornflakes.

**B**ut let us settle for Equation One. What now? Continue borrowing. Borrow the myths of the enemy but change history by enacting it as myth. Take three simple myths:

\* The Just War hypothesis (Christian)

\* Islamic Bomb

\* Historical Necessity (Marxist)

and transform them, Hindu style. Take the desert sands of Pokhran and *shilanyas* it through Rajasthan. The atomic *jal*, gel. It is the Babri model all over again. Make every Indian feel a part of historical necessity. Also let every Indian invent his own bit of nationalism. Protest against the US. Fast in front of the UN. Beat up another community. Just enough to keep things in order. If there is excess, crack down. What is the Rapid Action Force for? Flood India with the atomic *jagaran* from Baba Sehgal to Anuradha Paudwal.

Think of two further exercises. Remember the flag is like a spectrum. There is infrared and ultraviolet, which are not formally represented. On one side, think of the new corporate citizens of India. Coke. Pepsi. ITT. The coy bevy of banks. Exim. Also Enron. Even the Japanese, ready to weep at sanctions, set to play *samurai* for a few weeks and then plan for business as usual. Woo them all. They are the fourth stripe to the flag, our united colours of Benetton.

**F**or once, the NRIs are going to be useful as a power group to work on recalcitrant US Congressmen. As channels for finance in the tough interim period. As advocates of long distance nationalism. *Mera Bharat Mahan* looks best on internet.

Also play it easy. Tell the Americans that China violates human rights. That Pakistan is getting Islamic. Enough to splinter opinion. Remember it is the lobbies which are dangerous but an election contribution or two helps. Indians abroad should behave like the Jews. Remember there are more Zionists in New York than in Israel. Similarly, we should have more *swadeshi* jingoists in Silicon Valley than in New Delhi. Weave these technocratic fundamentalists into the cause; give them awards for their internet valour. They will love it and also feel that India with the killer instinct is reborn. Remember who we are. The India of Khorana and Arundhati Roy, Viswanathan Anand and Sachin Tendulkar. What does Pakistan have to match? Their Who's Who is emptier than the neanderthal telephone directory.

If the timing is crucial, time is equally so. When the euphoria of the first six months is over, there will come the time to pay toll tax. Now comes the mastery of details. Sign CTBT but cringe at every line. Join the

Big Five hypocrisy. The five with AIDS who pretend to be virgins. But be less jingoist in international circles. Be the quiet tough boys. Leave the Billy Graham stuff to USA and Blair. They do it better.

Step one is simple. Within a year you are back in business. Once the sanction games have been played, it is time to increase moral capital. Remember this is also a scale. At one end is Saddam Hussein. He is 10 on the Gaddafi scale, i.e. he has zero moral capital. At the other end is Nelson Mandela. He has surplus. We have to move to the Mandela end. After all we have fought nuclear apartheid. Show we are independent but mind our business. We are not communist or Islamic. We will fight terrorism, drugs, AIDS. Play the World Bank's good boy theory of governance. The rules are simple:

\* Emphasize human rights (i.e. remove child labour)

\* Respect contracts (free market plus yes to CTBT)

\* Fight terrorism

\* Organize campaigns against drugs

\* Go big on fighting AIDS

Globalization is simple as far as the Americans are concerned. Even better. Get moral by getting into all the ecology committees.

Support the United Nations force. We should be home in a year. *Jai Shri Ram*. But now let us move to Take II.

**A**ssume the secret committee of US Congressmen appointed by Clinton to monitor sanctions goes haywire. Worse, assume there is a riot or two. Add to it a human rights violation that pins the Shiv Sena and, worse, is played up by *The New York Times* and *Newsweek*. The sanctions begin to bite as Blair gets back to the colony on the second round.

Partly, there is also a miscalculation. We didn't listen to the warnings

about playing it cool. Our defiance was too strident and the US decided to project Pakistan as a major player in the Islamic group. We have to be punished.

There are the divisions in India, a distortion in the swadeshi agenda. The public likes the nuclear politics but the business community is not too happy about the opening up of the economy. The old family firms and the new fixers feel intimidated. The Bajajs, the Nandas, the Shrirams, the Kirloskars, and our friendly Jet Airways feel globalization does not help them. In fact, it exposes them. Short of the Ambanis, these firms are fairly moribund.

**T**he government gradually realizes that the biggest beneficiaries of socialism have been Indian businessmen. With all the controls, they have become perfect slobs. Their strategy had been simple. Complain about controls, champion free market and freedom and be socialism's biggest beneficiaries. Now, without socialism, Indian business feels orphaned. Nude. Hypocritical. Desperate for a fig leaf.

One needs a new buzzword and thank God for swadeshi. When your politics does not work (i.e. you are still a second-class power) and your business doesn't work (you are a third-rate business community), then swadeshi helps. It is a moral capital that you can borrow at low interest rates. So a deal is struck between BJP and business to cap globalization. In the name of swadeshi.

The strategy is simple. Spread a sense of paranoia. No one loves us because we are as good as them. To populism, add a bit of repression. You can handle repression through national security. Marry national security and swadeshi and you are home. Even if the home is a second-rate one and you feel like sawdust Saddams. So the

BJP stalls MNCs through principled attrition. The Left can't complain and the Congress is ambivalent. By that time even Chandrababu Naidu is deeply implicated and anyway computers is one field in which we are shining bright.

**O**ne thing about mediocrity is that it is never lonely and it has 'moral luck'. The Pakistanis provide us with a border skirmish, something small and just right for our jingoistic boots. The gung-ho epidemic spreads again and even sensible people heave a nationalist sigh or two. The US gets tough and BJP behaves reasonably. Things simmer down and so it moves to handle the enemy within.

It moves against the unions obtaining control of them. The new anti-hartal laws make it easy. INTUC and AITUC reel under the onslaught. Their leadership is impotent as a group of Weimar politicians. Worse still, Jyoti Basu obliges by giving up the ghost and the CPM is tottering in shambles in Bengal. With Mamata happy to be a well-behaved Jayalalitha, the RSS ideologues grin smugly to themselves. Apart from one or two burps from the PUCL-Amnesty section, the stables are clean. The next election sees the BJP home with 278.

Still, there is uneasiness in the air. It is the people who seem tired of swadeshi. Democracy is one import they don't want to embargo. But national security needs bigger solvents than disquiet. Indians, like the Pakistanis, are ready to eat grass as long as they have the bomb.

There is a small addendum to the above. Govindacharya and Gurumurthi felt an internal audit of decisions and strategies was necessary. The usual astrologers promising greatness in 2001 was not enough. They felt the need to talk to someone wise, above the noise of everyday politics. They

decided to meet 'the historian'.

The old historian smiled, chewing quietly on some invisible nut in his mouth. 'The BJP regime is a soft state,' he said, 'a state without a vision. It thinks of consequences for about two weeks. Empires are not built in a fortnight.'

The ideologues were uneasy, wondering whether the visit was a good idea. 'What is to be done?' one of them asked.

'Ah! A Leninist,' the old man said, while the group looked puzzled.

'Abolish Sunday,' he said. 'We didn't have Sunday two hundred years ago. The British brought it along with them. Wait, let me explain. Fights sanctions by changing categories. You can't drown an amphibian,' he said. 'Also stop reading *Glimpses of World History*.'

**O**nly Govindacharya understood. A guerrilla war of categories. A civilization confronts the rest. A civilization encapsulating a nation state. The old man continued. 'Understand China. Not Pakistan. The latter is still fresh behind the ears. It has no history beyond fifty years. China has Needham,' he added. He was referring to Joseph Needham's *Science and Civilization in China*, a work as huge as the Great Wall. We don't have a set of volumes like that. Only an empire can extract tribute as a labour of love. All India gets are the Naipauls and Nirad C. Chaudhuris and the new adolescents writing about pimples and IAS officers.

An IAS officer is a *patwari*. He is too small-scale. Power should create awe, grandeur. It has a complexity that a village bully or a street goon does not have. And the BJP is still a gathering of *munshis*.

'Smell like a civilization,' he pleaded. 'And that is what is wrong with all of you. When Bill Gates comes, you

drool. When Albright snuffles, you proclaim pneumonia. You live in a state of psychological siege. You act as if you want sanctions, otherwise the world does not know whether you exist.' Pramod Mahajan laughed and then spluttered to a stop. There was a silence around the room, expectant and waiting. The old man, they knew, was warming up.

'Sanctions are good for us. Look at a small state like Cuba. It fights sanctions and lives. The quality of its agriculture has improved. It does not use pesticides and idiot fertilizers. Sanctions help only the object of sanctions. We should use it to switch tracks, create a real state.' He looked sadly at the group around him. What he needed were samurai, not BAS afraid of failing exams. 'Why wait for sanctions? Let us renounce aid ourselves. Why wait to diet, when we should be fasting? Refuse to be a global market. Our markets are big enough to sustain us. Say no to Pepsi, Enron, Coke and watch them panic. They can only blame Clinton. Reverse the process. Confront the amorality of America and say it must face sanctions till Bhopal is paid up for. Capture the ground.'

'You can't bribe a teetotaler with whisky. Alcoholics can't fight sanctions. Think that you are an empire. Don't act like students complaining about a tough exam paper. Change the questions. Change the rules of the game.' There was consternation in the crowd. Someone felt he was not realistic. Suddenly the historian was angry, like milk boiling over.

'Idiots,' he snapped. 'Don't you know that the Machiavellian moment and the Gandhian moment are the same. They demand self-control. There is a *self* in self-reliance and self-control. Who are *you*? What are *your* dreams? True empires are civilizations. You don't build them on punctuation marks. You need men to match

the cosmos. Legislate a different world. Understand power. It has the fury of a waterfall and the delicate accuracy of a titration. Even excess has to be calculated.'

**T**he new princes listened and asked: 'What should we do?' The old man knew they were playing Mahabharata. These were the Pandavas tired of the B+ Bhishmas in the RSS. He wondered if they realized that state formation had altered since then. He repeated for them. 'Stop acting as if you are under siege. Act normal. Feel the logic of empire. Humpty Dumpty did not build the Great Wall of China.'

'Step II. Celebrate. Announce that you are cleaning up the Yamuna. It is a sewer. A ditch. Your sense of power smells of sewage. Let it flow. Let a person driving up to Delhi see the Yamuna flow past Lal Qila. Remember the nuclear bomb is a symptom of our need for power. It is not power itself. We are not yet Japan or Germany. Also know that power needs generosity. It can't thrive on myths of scarcity. Give and give in a way that stuns the world.'

'Give what?' asked the audience.

He ignored the question. 'Have you read Castro?'

'He is a communist,' butted someone. 'Silly,' The old man replied, 'America has made more nationalists into communists than Stalin did. Try to understand the Castro of the earlier period, proud of the revolution, proud of Cuba's work on sugar.' In a speech, he said, 'Who would ever think of patenting Shakespeare or Cervantes? Who would dream of patenting jazz? We declare all research on Cuban sugar free.' That was Castro's imagination. We can go better. We have 40,000 varieties of rice. More than America can dream of. Let us declare our gene plasm as free. FREE. A gift from the greatest community of inven-

tors we ever had, our agriculturists. Let us refuse to recognize all patents on life and many Third World countries will follow. American NGOs will also help. The First World would look silly trying to patent ginger and turmeric.'

'Then, reverse the model in a controlled way on the bomb. Declare that new provisions must be elaborated. A scaling down of weapons must be introduced. Make the Japanese or Germans in charge of the timetable. Ask for the year 2000 as the first target. Insist that the number of weapons be used as an indicator for pollution counts. Insist on a UN tax on it that we too are willing to pay, just like global emissions, and this time the cows won't get in the way. Keep the world guessing.'

'Mahathir got it right when he said usury was wrong. Only he didn't sustain it. So he sounded like a cranky voice in the wilderness.'

'Plan. Move away from petroleum. It is enslavement. Find new sources of energy. Make India the home of alternate energy. Teach the Chinese what a great leap forward is. But to do that you must revitalize your architecture, your rivers, your buildings, and your transport. You can't be a great power on bombs alone. That much Soviet Russia can teach you.'

'Make the bomb the text not the pretext. Teach the Chinese and Japanese a thing or two about civilization.'

**T**he BJP ideologues were embarrassed. They thought the old man was crazy. He nodded sadly and said, 'You are second-rate Americans, like Nehru was a second-rate Englishman. He couldn't stand up to the Chinese. Nor can you.'

'What then,' said a BJP man. 'What do we do?' The answer was distant and final.

'Migrate,' he said.

# Nuclear power and human security

ITTY ABRAHAM

WHERE are we now? At the present moment, there are a number of very real dangers that lie ahead for the people of India and Pakistan. Some have been the stuff of expert commentary, both in the sub-continent and in the West – the possibility of war over Kashmir leading to the use of nuclear weapons, the absence of secure command, control, communication and intelligence facilities increasing the danger of weapons being used in error or miscalculation, the small number of weapons on both sides producing a logic of ‘use them or lose them’, the chance of accidents and mishaps leading to nuclear detonation, the possibility of pre-emptive strikes, and so on. While not discounting any of these and other prognostications, the greater danger in my view is that we get trapped in a conceptual box bearing the stamp, ‘Made in the Cold War’.

As the outlines of an explicitly nuclear South Asia take shape, the only thinking that seems possible comes from the experience of the Cold War. We see this in a number of ways: recounting the similarities and differences between the India-Pakistan relationship and the USA-USSR as a way of explaining why nuclear conflict is more or less likely in South Asia, borrowing strategies and ideas that are supposed to have reduced tensions between the superpowers, or more insidious, the USA offering incentives to India and Pakistan not to go further down the nuclear road which replicates the unequal international structure of that period. But why is mimicking the Cold War experience the correct path to take?

Do we really want to end up where the USA and Russia are now – with thousands of missiles still pointed at

each other, with merely a small number of warheads removed from missiles still in their silos, with nuclear weapon armed submarines still cruising underwater, with arsenals still stacked with nuclear tipped artillery shells, with new sub-critical and hydrodynamic testing facilities coming into being, with testing ranges still open and ready for use, with thousands of nuclear scientists still employed by weapons labs? How can an end like that seem like a solution? To which problem is it a solution?

**T**he seduction of the Cold War (and its 'end') is what unites the glee of Indian right-wingers who have now found their masculinity and the cold-blooded approval of the votaries of 'political realism', both here and abroad. The conclusions they draw from an uncritical acceptance of a particular understanding of the political history of the last half century can be reduced to these: For the realists, nuclear weapons provide the ultimate security of the state, and a stable condition can be achieved between nuclear rivals through the import of the logic of deterrence. For the formerly emasculated, every country desires nuclear weapons because countries with nuclear weapons are the ones that count. India's destiny lies in possessing nuclear weapons because it is a great civilization. Are these statements as self-evident as they are made out to be?

It is easy to dismiss the presumptions of the raw nationalists of the right. First, it is a logical fallacy to assume that because all the present permanent members of the Security Council have nuclear weapons, possession of nuclear weapons will entitle any country to a permanent seat on the Council. The world now measures international influence in other ways. Second, not every country desires nuclear weapons. Two countries in a

somewhat similar position to India and Pakistan, Brazil and Argentina, recently gave up their fairly well developed nuclear programmes. It is not a coincidence that this was done at the moment when the military regimes that had dominated both countries for much of the post-War period finally returned to their barracks.

South Africa's former apartheid regime did the same – renounce nuclear weapons – in its historic transfer of power to the black majority. But, it could be said, perhaps these are special conditions. What about Australia and Sweden, both of which had active nuclear programmes, but gave up the search for weapons in the 1950s? What about Japan and Germany, both of which have large scientific communities and who sit on large stocks of fissile material: neither show signs of developing weapons programmes. What about the other 40 countries around the world that could do it but have not? There is no truth to the assertion that those who can do it, will, or that international acclaim and respect follows those who are acknowledged nuclear powers.

**R**emember that during the 1995 Non-Proliferation Treaty negotiations, the nuclear powers were forced by non-nuclear countries to accept the importance of Article VI – the demand that nuclear powers work toward general disarmament as a condition of the treaty's indefinite extension. Recall also the international fury that ensued when France blithely set sail toward the South Pacific to run a series of nuclear tests before signing the Comprehensive Test Ban Treaty: the reaction so shocked the French establishment that they hurriedly cancelled their last few tests claiming they had all the data they needed.

What about the 'realists' who want to copy the actions and rhetoric

of the nuclear powers? The condition that is supposed to have prevented war between the USA and the USSR during the Cold War is based on the horror of the destructive potential of these weapons. Whether for those who believe what happened in Hiroshima and Nagasaki in 1945 was so terrible that it should never happen again, or for the nuclear strategists who believe that no government would be so irrational as to risk massive destruction of its own people in order to pursue belligerent aims against another country the present system is built on the premise that nuclear weapons cannot be used. That simple hope is the basis of 'successful' nuclear deterrence between the USA and the USSR/Russia.

**B**ut remember, 'successful' nuclear deterrence does not make conventional warfare less likely. If anything, the historical record shows that the nuclear powers, successfully deterred from dropping missiles on each other, continued to fight each other through a variety of surrogates in Africa, Latin America and Asia for nearly half a century. The price for the Cold War was paid with the lives of black, brown and yellow people – not a sign of success if you lived anywhere other than the USA or USSR. For India and Pakistan, there's nowhere else to go or, nuclear weapons on both sides say nothing about the likelihood of peace breaking out. Rather, the presence of nuclear weapons may make policymakers more sanguine about resorting to conventional and unconventional forms of warfare.

The moral sanction of not using nuclear weapons because of their destructive power is soon trumped by the peculiar form of 'rationality' that becomes the norm for strategic discourse once nuclear weapons are in place. As nuclear war fighting plans

are drawn up, policy-makers are 'rationally' led to make calculations on the basis of the threat potential of relative destruction. Does a destroyed Karachi equate a destroyed Mumbai, or should New Delhi be added in order to make the relative loss to each country the same, they ask each other. Are nine million Indian dead the same as one million Pakistani dead, given the population differentials of each country? That even asking such questions betrays a fundamentally immoral condition is soon forgotten once the rational game theorists and strategic thinkers start ruling the roost.

**W**hat deterrence promises is a condition where an absurdly heightened state of fear is seen to be the only way to maintain the *status quo*: it normalizes pathology. For example, the lesson of the Cuban Missile Crisis is not how tough US President Kennedy was in making the Soviets back down, or how cleverly Krushchev saved Cuba from US invasion. Rather it is how easily a situation like that emerged, and how difficult it was to back away from the crisis. When the measure of international stability becomes an exchange of threats and counter threats, we are always in a state of crisis. As we get deeper into the nether world of deterrence thinking, policy-makers will agonize over whether the signals of threat escalation are being read clearly by the other side. That uncertainty will lead to greater insecurity on both sides as time goes on. And, when the state of security is reduced to the intangible feeling of how willing someone is to push the nuclear button – the reliability of the threat – sooner or later, the button will be pushed.

2

Western-style deterrence thinking is a call for extremists on both sides of the border to come to centre stage, because their threats are more credible

to the other side. When we accept deterrence as the mechanism to keep war from breaking out, we leave ourselves permanently hostage to the whims and fears of men whose names we don't even know, whose mental state is never quite assured, and whose own sense of masculinity is always in doubt. We will not even be told when the two countries go to the brink of war, because national security concerns are at stake. Deterrence thinking helped perpetuate the Cold War; it legitimized the production of more weapons of ever-increasing destructiveness. Deterrence knows no way of ending a hostile stand-off, only its management. Deterrence cannot help us move toward a safer and more secure existence. It must be rejected.

I believe that nuclear weapons and their associated ways of thinking have become internationally sanctioned means for political leaders to avoid dealing with ongoing conflicts, whether real and imagined. The immediate task is to prevent weaponization and deployment in South Asia. But we can only do that if we know where to look and how to understand what we see.

**I**t is necessary to remember that for the most part western strategic thinking followed advances in weapons technology, not the other way around. Contra the sanitized versions of US Cold War history, which make it appear that a grand strategic plan was set in motion after the Second World War to contain and defeat the Soviets, in fact, a far more *ad hoc* system was the norm. Weapons developers and university scientists, driven by huge budgets and a culture of technological one-upmanship, were principally responsible for the shift from a deterrence strategy called 'counter-value', with population centres as principal targets, to 'counter-force' strategies,

a far more dangerous option which could take away an opponent's second strike capability, and thus increase the chances of war.

By their focus on increasing the power, accuracy and efficiency, first of bombs, then missiles, and now lasers and other anti-missile devices, scientists forced the strategists to come up with new ways of rationalizing their technical accomplishments into a new equilibrium of terror. Once new generations of weapons were built, strategists worked hard to develop new iterations of old theories. It would not be inaccurate to argue that the greater foes of arms control between the Soviets and the USA were not each other, but their own scientists and weapons developers. Is it any different in India?

**T**he problem of nuclear weapons is larger than its purported role in international relations. We need to understand, first, that the nuclear crisis in South Asia is part of a larger global crisis, which is the existence of huge arsenals of nuclear weapons in a number of countries. Second, that only domestic pressure will be sufficient to close these nuclear complexes down international treaties are necessary, but not enough. And third, that those who have the most to fear from these arsenals are the domestic populations of nuclear weapon states.

Let me focus on this last point. Nuclear complexes across the world constitute, apart from their destructive potential, a continuing source of danger to the populations that they are meant to serve. We have seen, for the last fifty years and across the world, the cost of nuclear decision-making for popular security and well being. We have documentary proof that US and Soviet nuclear scientists exposed human subjects and soldiers to nuclear radiation, that unprotected casual

labourers were used to clean up radioactive leaks and spills in India, that serious environmental and human disasters were caused by accidents in nuclear power reactors all over the world, that aboriginal people in Australia and native Americans were pushed off their homelands when uranium was discovered there.

**A**t the same time, we hardly know about the means by which highly contaminated nuclear wastes will be stored until safe to dispose off, the extent of genetic mutation and radiation sickness among populations in the neighbourhood of reactors, mines, and testing grounds, or about the huge and scarcely accounted amounts of resources that have been expended on these complexes over the last five decades. It must be noted also that when most of these cases were exposed, the first response of those in charge was cover-ups, stonewalling, denials, and attempts to intimidate and coerce the victims.

These problems are not the result of the actions of a few misguided individuals. The kind of behaviour that the nuclear complexes of the world induce is built into the constitution of modern, large, capital intensive technological systems. The scale, size, and complexity of these systems – from nuclear power stations, large dams, chemical factories and oil supertankers to intercontinental airplanes and their associated sub-complexes of airports, stations, pilots and traffic controllers – bring with them two things. For all their superb engineering and the material ease they make possible, the size of these complexes also entail a scale of destruction and damage that is beyond most imagining; more important, they carry a built-in danger of breakdown and failure due to their very complexity. Indeed, we have developed entirely new notions of risk and uncertainty, in both actuarial and phe-

nomenological terms, in order to cope with the dangers embedded in these systems.

These systems are of technical necessity extremely centralized and hierarchical in organization, involving small numbers of highly trained skilled workers and expert managers to run them. Information flows are carefully coordinated and only run along approved circuits. The difficulty of maintaining this rigorous system requires constant policing of the boundaries of the complex. Endless screens are set in place to prevent the intrusion of extraneous factors: whether environmental or infrastructural. However, due to the complexity of these systems, this policing is directed not towards eliminating all potential sources of disaster, but reducing the inherent likelihood of failure to 'acceptable levels'.

**T**he public is rarely or never consulted about the tradeoffs embedded in the definition of 'acceptable levels' of risk, about failure rates, or international standards of fault tolerance. Rather, once a system is in place, the lay public must be kept at bay for their foolish, uninformed concerns constitute a threat to the ongoing efficiency of the system. Over time, and especially as system failures are limited or managed in-house, the distance between those within and without the system grows. The privileging of scientific expertise produces a sense of infallibility: this eventually becomes a license to claim a superior understanding of the common good. Of necessity, restricting information – secrecy – becomes the standard operating procedure of these systems.

With a number of the more everyday technological complexes, the public has developed an ad hoc consensus for trusting their functions and accepting their costs. At various

moments, especially just following a major disaster – an aircraft crash, tanker spill, or reactor meltdown – the public has been drawn into expert discussions about the conditions under which the functioning of these systems takes place. Even if the public is not polled about its opinions, it is represented in the discussions: as victims of these catastrophes, if nothing else. The interiors of these black boxes become partially visible in a crisis, creating over time a tacit social understanding which helps absorb the fear of their presence. But with the nuclear power complex even that is not possible.

**N**uclear power, apart from epitomizing all the centralized, hierarchical and concentrated tendencies of large technological systems, is always clouded in the public eye because of its association with national security. From its arrival in the world, nuclear power's first association was with massive destruction, a destruction that soon became identified as the defining feature of national security. Since then, even when associated with peaceful uses, as with producing electricity, nuclear power carries with it the trace of its original sin. We know only too well from the Indian experience, public scrutiny is habitually rejected, ridiculed, or denied through the exaltation of expert knowledge, imposition of definitions of risk and efficiency that favour these systems, or by the invocation of larger social interests. The most opaque and powerful of these larger interests is national security.

Where should we go? Even as the BJP government's definition of real and imagined threats to national security is being contested on many fronts, other tasks need to be taken on. The first step to breaking the chain leading to nuclear disaster lies in far greater domestic oversight of the nuclear and

space complexes – India's 'strategic enclave'. The current omnibus legislation that insulates the atomic energy complex from all scrutiny needs to be replaced by more specific, targeted laws that recognize the public's right to know what goes on in its name. Given the Lok Sabha's historic lack of will to take on the task of oversight, an independent commission staffed by judges, scientists, economists and doctors needs to be set up to conduct a complete social accounting of the Indian strategic enclave. This commission must be given access to all official records and data and allowed to conduct its own interviews with those within this enclave as well as affected by it. Apart from informing us what was done with the enormous funds spent on this sector, public accountability for decisions taken over the last fifty years will finally become possible.

These activities must be carried out in conjunction with citizen's groups from around the world, especially in the declared nuclear weapons states. Names of military scientists and weapons developers from around the world must be made public, so as to increase pressure on them to relinquish these activities and to remind them that they are being constantly monitored. Pressure must be exerted on national legislatures to ratify signed treaties. A parallel system of verification of weapons states' treaty obligations by domestic groups with the necessary expertise to carry out scientific studies and publish reports must be created. Countries like China, without internationally credible domestic monitors, must be pressured to permit teams of international observers from non-nuclear weapons states to verify treaty compliance. This set of linked activities will not be complete until internationalized, but need not wait until the whole system is in place. The people of India can take the lead.

## Testing the world order

SIDDHARTH VARADARAJAN

IN analysing the regional and international dynamics of India's decision to test five nuclear devices on May 11 and 13 this year, it is important to bear in mind exactly what changed and what did not. The fact that India has nuclear weapons was already more or less an open secret. Though the country has had a civilian nuclear programme since soon after Independence, it was only in 1964 that its potential military 'spin-off' was officially acknowledged. In that year, Homi Bhabha made a statement – in response to parliamentary questions

about China's first nuclear test at Lop Nor – that India could assemble a nuclear weapon in 18 months if the need should so arise. In 1974, the Indira Gandhi government conducted a so-called 'peaceful nuclear implosion' at Pokhran, in reality a simple fission bomb.

**W**hile the decision to 'go nuclear' was apparently held in abeyance after that, most foreign analysts and governments assumed India had embarked on a dedicated weapons programme in 1988.<sup>1</sup> The open development of ballistic missiles like Prithvi and Agni – which have little military value other than as delivery systems for nuclear weapons – added to this sense of certainty about India's intentions. Thus, those governments with a vital interest in the regional and global proliferation of nuclear weapons – Pakistan, China, the US, Russia, France and Japan – had already begun to factor India's arsenal into their strategic calculations. Pokhran II only served to validate these widely held beliefs.

Likewise, it has been an article of faith for India's strategic elites that Pakistan has had a full-fledged nuclear weapons programme for more than two decades. Moreover, many Indian and western analysts have assumed Pakistan has been in possession of fully assembled nuclear weapons for at least a decade. With the testing of Pakistani nuclear devices at Chagai some two weeks after Pokhran II, this belief would also seem to have been proven correct.

Insofar as the *stated* rationale for nuclear weapons in both India and

1. Revelations by K. Subrahmanyam and others involved with Indian nuclear policy in the wake of Pokhran II confirm that 1988 was in fact the year the weapons programme began in earnest. See his 'Evolution of Indian Nuclear Option' in *Strategic Analysis* (forthcoming).

Pakistan is 'minimum deterrence',<sup>2</sup> it is reasonable to surmise that the same was already operating in the bilateral context since well before Pokhran II and Chagai. Of course, the non-falsifiable and circular logic of deterrence – the absence of nuclear conflict despite the possession of nuclear weapons by two adversaries is sufficient proof of the validity of the theory – would suggest Pokhran II and Chagai cannot be explained with reference to that rationale alone. Moreover, since (according to the Indian government) Pakistan's nuclear capabilities have been created by China and, therefore, are fully known by it, Beijing would be extremely foolish to assume New Delhi did not possess a similar – if not more advanced – weapons capability. Thus, deterrence, such as it is, was already operating on the Sino-Indian plane as well and the absence of nuclear conflict between India and China since 1964 (when China unveiled its nuclear weapons and India acknowledged its capability) or at least since 1974 is sufficient 'proof' of that fact.

**I**t is difficult logically to sustain the claim that Pokhran II was necessary to make the already existing state of deterrence (or 'existential deterrence') more robust and, at the same time, cling to the doctrine of 'minimum deterrence'. In fact, like the concept of deterrence itself, 'minimum deterrence' is a chimera. For if qualitative weapon enhancement – which

2. Virtually no mainstream advocate of the nuclear option in either India or Pakistan has developed maximalist rationales for the Bomb like the Cold War doctrines of mutually assured destruction (MAD) or pure warfighting. The fact that these have not openly been articulated in the South Asian context, however, does not mean they are totally absent. See James H. Lebovic, *Deadly Dilemmas: Deterrence in U.S. Nuclear Strategy*, Columbia University Press, New York, 1990, for an assessment of these doctrines.

is what sets apart Pokhran II from Pokhran I – is a *sine qua non* of credible and dynamic deterrence, it is inevitable that governments ceaselessly will seek more precise, well-honed nuclear devices that are superior to those possessed by their adversaries and whose only utility would be as first-strike weapons. The experience of the Cold War arms race, and the technological history of nuclear weapons and of their cognate – ballistic missile defence – clearly proves that deterrence is not stable or autonomous but requires continuous ratcheting-up.

**T**his preliminary excursus on deterrence was necessary in order to better appreciate the motives behind Pokhran II. To sum up the argument so far, the stated, *passive* rationale of wanting to deter Pakistani and Chinese nuclear weapons cannot fully account for the Indian government's decision to test. Rather, there must have been an *active* reason. New Delhi's decision openly to go nuclear – and the reaction of the US, China and others to this – can only be understood in the context of the Indian ruling elites' ambitions on the world stage.

The nuclear tests were a proactive declaration of intent, the issuing of notice that India has every desire of emerging as a big power and will not confine its ambitions to the regional theatre. It is an expression of the Indian states' rejection of both a unipolar world dominated by the US and a multipolar world which excludes Indian big capital from the division of the spoils. At the same time, this does not mean India will be able to sustain such an ambition in economic terms, or even that it is unwilling to play along with this or that power in order to further its own interests regionally and globally. Indeed, the BJP-led government's initial pronouncements holding China

responsible for its decision to test – articulated directly and in Prime Minister Vajpayee's 'explanatory' letter to US President Bill Clinton – were intended to signal a willingness on its part to sign up for a loose US-led alliance against Beijing.

**I**n the event, the government seriously miscalculated, for despite the acrimonious debates in US political and intelligence circles about the wisdom of President Clinton's China policy, the national consensus there favours the 'engagement' of Beijing rather than its isolation or explicit containment. In the long term this view may change, but for the present US capital is too committed to China to envisage the kind of rupture India would like to see in Sino-American relations.

As far as China is concerned, Pokhran II has affected it at two, inter-related levels. Not only has New Delhi's proclamation of nuclear status been read as a claim to a greater role in the world – this is something Beijing might have lived with – but the explicit identification of China as the 'other' suggests this claim is being advanced at the expense of the Chinese. Thus, while Beijing's response to the first set of Indian nuclear tests on May 11 was rather muted, there was a marked difference in the tone and thrust of its official statement following the May 13 explosions. It is self-evident that the change was brought about by the revelation of the contents of Vajpayee's letter to Clinton – in which the Chinese threat was alluded to.

The issue of Chinese missile and nuclear proliferation to Pakistan deserves careful analysis and is not something which should be brushed under the carpet by critics of the Indian government's nuclear or China policy. As a big power with hegemonic regi-

onal and global ambitions, China's outlook and policy is not very different from, say, the US. Proliferation to Pakistan serves several important objectives, especially in the post-Cold War world. First, it ensures the loyalty of Islamabad, desirable as an end in itself and as an entry-point for making inroads into Central Asia.<sup>3</sup> Second, it helps confine a potential rival like India to a narrow, South Asian context. Third, it provides crucial leverage in the strategically important region of West Asia, especially when taken together with its sales of M-9 missiles to Iran and CSS-2 missiles to Saudi Arabia.

**I**ndian analysts often tend to forget that Pakistan sits astride the sea lanes out of the Persian Gulf and that this fact of geography has played a vital role in US calculations about Pakistan's strategic value.<sup>4</sup> For China, the same logic applies. In October 1991, President Yang Shangkun visited Iran – the first visit by a Chinese head of state – as well as Pakistan, in a tour which was seen by western analysts as aimed at building a 'strategic consensus' against the post-Desert Storm US dominance of the Gulf. The Chinese side noted the similarity of views 'on many international and regional issues' while President Hashemi Rafsanjani was quoted as saying Iran rejected the US-dominated new world order and its attempts 'to interfere in

3. The Central Asian consideration may not be as important as is commonly assumed given China's success in politically engaging several Central Asian republics via the 'Shanghai process' and the signing of a major oil deal with Kazakhstan by which China will start to access the region's energy resources by pipeline.

4. Recently, Hamza Alavi has reminded us of this point by tracing the origins of Washington's pro-Pakistan tilt in the Cold War to the uncertainty of Iran's reliability as an ally following Mossadegh's nationalisation of oil in 1953. cf in *Economic and Political Weekly*, Vol. 33, no. 25, 20 June 1998.

other countries' internal affairs by simply accusing them of developing nuclear weapons.<sup>5</sup> As for Pakistan, Yang's visit was significant because it came so soon after Washington's decision, as mandated by the Pressler Amendment, to terminate military aid to Islamabad because of the latter's nuclear weapons programme.

**W**hile it is doubtful China has provided nuclear weapons technology to Iran – the latter is a signatory to the Nuclear Non-Proliferation Treaty (NPT), is subject to full-scope safeguards and has repeatedly been certified as weapon-free by the International Atomic Energy Agency (IAEA) – there is little doubt that it has proliferated technology and materials to Pakistan.<sup>6</sup> Most of this collaboration took place after Pokhran I in 1974 and before China signed the NPT in 1992, but some transfers have taken place since. The US has deliberately failed to make a determination to this effect mainly because of its inability to do anything about it. This display of US powerlessness has obviously caused consternation and disbelief in Indian official circles. For India, however, there is little strategic difference between a wholly indigenous Pakistani nuclear weapon, a purloined one or a gifted one.

So long as Indian and Pakistani nuclear weapons were kept behind a veil of official denial or obfuscation, the US did not fret too much. The mild response of the US to the 'covert' nuclearisation of Israel, India and Pakistan all these years – in contrast

5. See Lillian Craig Harris, *China Considers the Middle East*. I.B. Tauris, London, 1993, p. 258.

6. See William E. Burroughs and Robert Windrem, *Critical Mass: The Dangerous Race for Superweapons in a Fragmenting World*, Simon and Schuster, New York, 1994, pp. 60-90, for a fairly credible account of Pakistan's nuclear weapons programme.

to its reaction to Pokhran II and Chagai – seems to suggest Washington makes a distinction between ‘quiet’ and ‘loud’ proliferation. Even though the Comprehensive Test Ban Treaty (CTBT) marked a turning point in US policy and suggested Washington’s patience with nuclear hold-outs was running out, there were no strident demands for the two countries to renounce their weapon option by signing the NPT. This has now changed. Not only did the US and the other four permanent members of the UN Security Council make this demand in a joint communique on 4 June 1998, but the full Security Council meeting the next day also passed a resolution to that effect (UNSCR 1172).

**R**esolution 1172 is the first explicit reflection of the Indian and Pakistani nuclear tests on the plane of international law and represents a disturbing watershed in at least two important ways. First, it is unprecedented insofar as it urges India and Pakistan to sign the CTBT and NPT. Adherence to the NPT has been raised before by the Security Council only in reference to Iraq (eg. UNSCR 687, the Gulf War cease-fire resolution) but then Iraq has been a party to the treaty since 1968 and could be expected to conform to its obligations.

The case of India and Pakistan; however, is different. It is a common precept in international law that countries cannot be forced to sign treaties they do not wish to and that the obligations of treaties cannot be applied to non-signatories. Apart from Article 34 of the Vienna Convention on the Law of Treaties (1969), which states that ‘a treaty does not create obligations or rights for a third State without its consent,’ Articles 2(4) and 2(7) of the UN Charter also guarantee non-coercion and non-intervention. Thus, there is a compelling case for consid-

ering the Security Council demand for India and Pakistan to accede to the two treaties to be *ultra vires*.

**T**he second questionable aspect of Resolution 1172 is its linkage of the Indian and Pakistani tests to the omnibus notion of ‘threats to peace and security.’ Thus, even though it is not enforceable, some of the language of the resolution is reminiscent of Chapter VII of the UN Charter and could conceivably be used for future enforcement action should a consensus or majority in the Security Council emerge. At any rate, this is the first time that a UN resolution has considered the ‘proliferation’ of nuclear weapons (rather than their possession or use) to be a threat to international peace and security.

The only precedent is the Security Council presidential statement issued after its summit-level meeting in January 1992, in which two paragraphs were devoted to the proliferation of weapons of mass destruction and, specifically, to nuclear proliferation. The context, of course, was the aftermath of the Gulf War against Iraq and the heightened sensitivity of the US towards the possibility of nuclear, biological and chemical weapons falling into the hands of an adversary.

That statement, which India also signed in its capacity as a non permanent rotating member of the Security Council said: ‘The proliferation of all weapons of mass destruction constitutes a threat to international peace and security. The members of the Council commit themselves to working to prevent the spread of technology related to the research for or production of such weapons and to take appropriate action on that end.’<sup>7</sup> Even though India lamely justified its acceptance of this sweeping and motivated assertion by making

a distinction between vertical and horizontal proliferation,<sup>8</sup> the real aim of the statement’s instigators was never in any doubt.

James Leonard, a former US ambassador to the UN, has said that the Security Council statement is sufficient to give non-proliferation the status of a customary norm of international law, binding on all states whether or not they are signatories to the NPT. He said: ‘It could pretty well serve as the text of a Security Council resolution in which the Council would go on record as saying, “This is now a norm and we intend to enforce it”.’<sup>9</sup> Resolution 1172 of 5 June 1998 is a step in that direction. Certainly the US, Britain and Japan would have liked some threat of enforcement but stopped short of this goal only because of the opposition of several non permanent members from the developing world, as well as Russia.

**A**s a regime, the NPT was a product of the bipolar era. The treaty opened for signature in 1968 and came into effect in 1970. At the same time, even though its drafters could not have anticipated the momentous changes ushered in by the end of the Cold War, its architecture has proved to be remarkably enduring and has continued to dominate the contours of the emerging world order. The purpose of the NPT as far as the US, Soviet Union and Britain were concerned was to make sure no more countries (other than France and China) went nuclear. It was an attempt to lock in place the balance of power as it existed on 1 January 1968, and make the emergence of new challengers to the seemingly stable bipolar division of the world that much more difficult.

8. UN Doc S/PV.3046.

9. Quoted in Siddharth Varadarajan, ‘Playing Monopoly: The Nuclear Club Wins NPT Extension’, *Frontline*, 2 June 1995.

7. UN Doc S/23500 of 3 January 1992.

As Eric Chauvistre has noted, 'the NPT was originally aimed at West Germany and other western states that were considering the acquisition of nuclear weapons. Only later did the focus shift to Third World countries.'<sup>10</sup> On the same day that Germany acceded, the then British foreign secretary, Michael Stewart, conceded that, 'the whole future of the NPT had been dependent on the position of the Federal Republic.'<sup>11</sup> The German debate on the NPT was bitter and divisive, with Franz-Jozef Strauss, the defence minister from the ultra-conservative Christian Social Union, declaring in 1965 that the NPT would be the equivalent of 'a new Versailles of cosmic dimensions.' When in November 1969, Germany finally signed the NPT it made its accession conditional on a number of factors, such as the continued existence of NATO and its right to withdraw at extremely short notice in the case of an 'emergency', before even the mandatory three month waiting period.<sup>12</sup>

One of the legacies of this original aim of a non-nuclear Germany was the stipulation – inserted at the insistence of Bonn and Rome – that the NPT would last only 25 years, unless renewed. This legacy was overcome on 12 May 1995, when the state-parties to the NPT voted to extend the treaty indefinitely and unconditionally. This decision was taken even though the five nuclear weapon states had shown themselves to have been manifestly disinterested in keeping their side of the NPT bargain, namely undertaking

to disarm in accordance with Article VI of the Treaty.

Another legacy of the NPT's original aim is that INFCIRC/153, the document governing the IAEA's right to conduct inspections in non-nuclear weapon states (NNWS), is today considered by the US to be too weak. The IAEA's rights had been limited so as to encourage West Germany, Japan and Italy to sign the NPT, but Washington would now like to broaden the scope of inspections to make them more intrusive. Many countries fear this will make their sensitive military sites vulnerable to international (mainly US) espionage.

The 1993 controversy over the IAEA's demand for 'special inspections' in North Korea based on alleged evidence collected by satellites and other National Technical Means of the US was an attempt to retrofit the Agency with vastly expanded powers. Since the 1994 'Framework Agreement' between the US and North Korea led to the IAEA ending its insistence on 'special inspections' and Pyongyang suspending its notice of withdrawal from the NPT, a lid was put on the crisis without the issue of the IAEA's powers having been resolved.

Nevertheless, the US has succeeded in innovating a parallel inspection instrumentality – the UN Special Commission for Iraq (UNSCOM) – which reports directly to the Security Council and not to a more representative body like the IAEA Board of Governors. Secondly, it has also managed to legitimise the use of National Technical Means, both in the case of Iraq and for purposes of verifying the adherence of state-parties to the CTBT.

If the indefinite and unconditional extension of the NPT legitimised in perpetuity the possession of nuclear weapons in the hands of five nuclear weapons states, the CTBT – which the

US alone out of the five has championed steadfastly since 1994 – sought to build on that regime in two vital ways. First, by asking countries to forswear nuclear tests, it was a way of getting the nuclear hold-outs (India, Pakistan, Israel and Cuba) to sign the NPT by the back door and make the latter treaty even more water-tight. Second, by allowing for sub-critical tests and computer simulation of new and improved fourth generation nuclear weapon designs – a field in which US expertise was far ahead of any other country – it gave Washington an advantage in enhancing its arsenal.

As Christopher Paine has argued, 'a comprehensive test ban by itself will not prevent additional nations from acquiring a basic fission weapon in the 1 to 30 kilotonne range (that goal can only be achieved by a worldwide ban on the production, acquisition and transfer of weapons-usable fissile material). But a test ban would severely limit the ability of current undeclared nuclear states, and future proliferant states, to develop optimised pure fission weapons, and compact boosted fission and two-stage thermonuclear weapons of vastly greater yield, for ballistic and cruise missile delivery. And depending on its scope, a CTB could inhibit further engineering development by at least some nuclear powers of a class of very-low-yield nuclear weapons "specifically designed for tactical use in regional conflicts – the so-called mini nukes" – deployment of which would be a major, perhaps fatal blow to non-proliferation' (emphasis added).<sup>13</sup>

The CTBT's scope, of course, was finally fixed at a zero yield and excluded so-called hydrodynamic tests. Only the US, and arguably France, therefore, have the unambiguous capacity to

refine their arsenals purely on the basis of computer codes and simulation. China reluctantly accepted the asymmetry this implied so long as it could lock in place the asymmetry on the Sino-Indian and Sino-Russian planes. As for the US, Chinese doctrine continues to believe in the value of a limited deterrent, at least for the moment. A second line of defence for China was its insistence on the controversial Entry-into-Force clause – requiring India's accession despite its stated objections to the treaty – in order to delay the CTBT from coming into effect.

**W**ashington's multi-billion dollar Stockpile Stewardship Programme is aimed precisely at developing new nuclear weapons in the post-CTBT world. As Paine argues: 'This is a programme that goes beyond maintaining the six or seven proven weapon designs currently planned for retention in the enduring nuclear weapons stockpile under a CTB. The intent appears to be to preserve the "core" of the current nuclear weapon design capabilities of Los Alamos and Livermore through "an increased level of effort" in computer simulation and weapons physics research using a series of large-scale experimental facilities, most of which have yet to be constructed, and could ultimately entail an investment of several billion dollars. In the words of David Sharp, a Los Alamos weapons scientist, "we have to learn to design weapons on the basis of better computations, better modelling, and the testing of components." Some of these proposals come perilously close to what might be characterised by some as a deliberate programme to offset, and thereby evade, the intended restrictive effect

*Japan and the Future of Nuclear Weapons.* Carnegie Endowment, Washington, D.C., 1995. p. 101.

of a CTB on the ability to design and certify the performance of new nuclear weapons.'<sup>14</sup> In a July 1998 report, the US-based Institute for Energy and Environmental Research has said that the US is now focussing its attention on developing pure fusion weapons – which do not require fissile material or explosive testing outside the controlled environment of a laboratory. The institute's scientists argue that the research programmes of the National Ignition Facility (under construction at Lawrence Livermore National Laboratory), the joint US-Russian laser experiments at Los Alamos, and the wire-array z-pinch device at the Sandia National Laboratory are solely weapon-oriented, as is France's Megajoule laser near Bordeaux.<sup>15</sup>

**R**egardless of what decision India takes on signing the CTBT in the post-Pokhran II era – and there are compelling reasons on either side – it is important to realize that the CTBT has nothing to do with disarmament or with reducing the salience of nuclear weapons in the military strategy of the US or any other nuclear weapon state. On the contrary, the NPT-CTBT apparatus is aimed at ensuring the perpetuation of these weapons as instruments of domination and terror.

Both the Clinton administration's August 1993 report to Congress on its test ban policy as well as its sanitized Nuclear Posture Review released in 1994 continue to be couched in the Cold War discourse of 'extended deterrence'. Other documents, declassified in recent years, speak of newer rationales for the use

of nuclear weapons, especially 'mini nukes', 'micro nukes' and 'tiny nukes' in battlefield situations or for deterring an adversary from using weapons of mass destruction against the US or its allies in any part of the world. These include the US military's Doctrine for Joint Operations and the US Navy's Stratplan 2010.<sup>16</sup>

**T**o summarise, by ensuring (i) the NPT's indefinite extension; (ii) a CTBT with enough of a loophole for improving its own weapon designs; (iii) an expanded scope for intrusive inspections; and (iv) the treatment of non-proliferation as a customary norm of international law at the UN, the US has assembled for itself a political and legal framework it hopes will make permanent its military-technological superiority over all other countries. Central to this is the retention and refinement of nuclear weapons and the centrality of nuclear blackmail as the last resort guarantor of hegemony.

'Of all the potential weapons of mass destruction – nuclear, biological and chemical,' writes Glenn C. Buchan in a RAND organisation study, 'nuclear weapons still remain the most militarily useful and the most spectacular as terror weapons. Thus, if WMDs continue to proliferate in the world and possessing them has any value either as a deterrent or a war-fighting instrument, nuclear weapons are still the best choice, particularly for an "established" nuclear power such as the US.'<sup>17</sup>

Of course, such a dispensation is guaranteed to be unstable. As it is superseded by economic and political

developments, this framework is bound to appear unreasonable and highly rigid to different countries at different points of time. Already, multiple challenges to US power are emerging around the world, such as the establishment of the single European currency (which will eventually rival the dollar), the crisis in the Middle East peace process, the failure of 'dual containment' in the Persian Gulf, Sino-Russian detente, and so on. So long as economic and political rivalries remain dormant or below some threshold level, treaties like the NPT and CTBT present an illusion of stability, of the permanence of 'US leadership'. But when these contradictions cannot any more be contained within the old arrangements, they inevitably lead to tectonic shifts in the global balance of power.

**T**he secret Pentagon strategy documents, 'Defense Planning Guidance Scenario Set' and 'Defense Planning Guidance for Fiscal Years 1994-1999', leaked to the press in February and March 1992,<sup>18</sup> suggest the US is not unaware of future challenges to its pre-eminence. Indeed, the threats factored in go far beyond the 'rogue doctrine' propounded by the Bush administration in the aftermath of Iraq's invasion of Kuwait. Thus, it was suggested that Germany and Japan, besides Russia and China, could emerge as potential superpowers and rival the US in military terms. Though the two documents were disavowed and later replaced by sanitized ver-

sions in which all uncharitable allusions to potential rivals were expunged, it is obvious that the US is planning for a world which is robustly and even antagonistically multipolar. And one of the keys to managing such a world is to preserve, as far as possible, the basic architecture of the NPT, CTBT, and the proposed Fissile Materials Cut-off Treaty.

**W**ithin this scheme of things, India's nuclear tests are seen by Washington as a dangerous challenge to the very relevance and rationale of the NPT. And so they are. Not only has Pokhran II shown the NPT to be obsolete and anachronistic – which was already known – but it is also an invitation for other countries to test the treaty's limits. Pakistan followed suit two weeks later and there the present phase of 'proliferation' has come to an end. Israel, the only other non-signatory to the NPT with an undeclared nuclear arsenal, has given no indication of wanting to move away from its long-standing policy of ambiguity (i.e. 'Israel will not be the first country to introduce nuclear weapons into the Middle East').

Nevertheless, it would be naive to think that Pokhran II and Chagai will not have repercussions elsewhere. Countries which gave up their nuclear weapons option on the understanding that no others would develop them are bound to think again about the usefulness of their decision. In the region, Iran might feel threatened by Pakistan's nuclear weapon and feel compelled to develop its own. Another scenario, though less likely, is for Pakistan to pass the nuclear baton on

to Iran. And in other regions too there are likely to be knock-on effects. In that sense, the Pakistani tests are seen by the US as especially destabilising. If there was a marked hardening of Security Council and G-8 attitudes after Chagai, this was mainly because the 'demonstration effect' of Pakistan's tests on nuclear threshold states in the region is considered to be much stronger than India's. The latter's image as a global player is, after all, not really in dispute. For the US, the most worrisome scenario stemming from the Indian tests is the possibility that China may resume testing. That is why it accords utmost importance to both India and Pakistan signing the test ban treaty without delay or conditions.

**O**ne US analyst has described a scenario where 'an overt North Korean or Indian nuclear weapons programme might also encourage other states in the Middle East and East Asia to pursue a nuclear option. Indeed, should several middle ranking powers acquire nuclear status, countries such as Japan and Germany would feel real pressure at least to rethink their current policy of nuclear self-denial.'<sup>19</sup> In many US accounts, the nuclearisation of Germany and Japan is the proliferation equivalent of doomsday, for it would, in some sense, mark the formal end of the post-World War II era. Yet, how real is this possibility? Stephen Meyer has characterised the dynamics of the nuclear proliferation process as one of technological-motivational convergence. 'On the whole,' he argues, 'the technological aspect of the process is fairly monotonic over time. It increases both quantitatively and qualitatively as

1994, x. He goes on to argue that submarine-launched ballistic missiles should be the core of the US nuclear force, with bombers as back-up, while 'the US should be out of the ICBM business since they no longer offer any important advantages and they have distinct liabilities.'

time goes on.' The nuclear motivation of a country, however, can rise or fall depending on 'how the constellations of national and international events and politics develop. As a consequence, any given nation's nuclear propensity may bounce between various levels of weak, moderate and strong.'<sup>20</sup>

**I**n technological terms, both Japan and Germany (and several other countries) can go nuclear with virtually no lead time. In motivational terms, the propensity for either country to go down that path would be directly proportional to the extent of global and regional proliferation and instability, and inversely proportional to the degree of US commitment to 'extended deterrence' via the US-Japan Security Treaty and NATO. A major reason for the US desperation to establish a new role for NATO after the Cold War is the understanding that the dissolution of NATO would be considered by Germany and some other European states as a sufficient compromise of its 'supreme national interests' as to warrant withdrawal from the NPT. Likewise, Washington's reluctance to leave Asia to the Asians is based on its assessment that Japan would then almost immediately nuclearise.

At any rate, important voices have been raised in both countries questioning the viability of the NPT in a changing world. Thus, Erwin Haeckel of the DGAP (the German Society for Foreign Affairs, an equivalent of the IDSA) has argued that 'in the circle of the great powers... probably in the foreseeable future some actors (Japan, India, the European Community...) might come onto the stage who have neither the privileges of being permanent members of the UN Security Council nor enjoy being

acknowledged as established nuclear-weapons states... How to overcome this difference in status is not clear... but one should not put off considering the idea that some of these new great powers might contemplate making a legitimate claim to nuclear weapons. The NPT would be forced to face a terrible dilemma, a dilemma with apparently no way out.'<sup>21</sup> In the academic literature, the possibility of German and Japanese 'Gaullists' pushing for independent nuclear arsenals is increasingly being considered.

**I**f geo-strategic considerations and hegemonic ambitions are the main motivational factors for any country to acquire nuclear weapons, the myth that nuclear deterrence provides a perpetual guarantee against the danger of conflict is the single biggest ideological smokescreen that they can hide behind. As long as this myth is sustained by US nuclear strategy and substantiated by its perpetual possession of nuclear weapons, other countries—especially those with global aspirations—will almost certainly acquire them.

One of the imponderables that advocates of deterrence have to grapple with is that the logical conclusion of their doctrine must surely be that 'more is better' and that proliferation of nuclear weapons (in a controlled and gradual manner) will actually help to prevent conflict throughout the world. Indeed, neorealists like Kenneth Waltz and John Mearsheimer have argued this seemingly absurd position with elegance if not persuasiveness.<sup>22</sup> A typical representative of the 'less is better' school, on the other hand, argues that 'the logic of "more is better" applied to nuclear spread is mistaken because it assumes that the decision for or

against nuclear war is a rational calculus based on a comparison of costs and benefits coolly evaluated. It is more likely that a decision for or against nuclear first use will be one of desperation or inadvertency, not one based on calculation and deliberation.'<sup>23</sup>

**O**f course, the use of nuclear weapons in desperation or inadvertency was as much of a danger for the Cold War adversaries as it is for any other possessor state. On several occasions, the accidental launching of nuclear weapons was averted in the nick of time. The paradox is that deterrence is actually predicated on the possibility of such accidents since 'the implementation of ever more stringent measures to prevent the accidental use of nuclear weapons would in most cases impair the credibility of a country's nuclear deterrence position.'<sup>24</sup>

On the whole, it is difficult to disagree with Van Creveld's assessment that 'much of the western literature on proliferation appears to be distorted, ethnocentric and self-serving. It operates on the principle of *beati sunt possedentes* ("blessed are those who are in possession"); like the various treaties to which it has given rise, its real objective is to perpetuate the oligopoly of "old" nuclear powers.' Thus, he argues, 'weapons and technologies that used to be presented as stabilising when they were in the hands of the great powers were suddenly described as destabilising when they spread to other countries.'<sup>25</sup> In reality, these weapons were destabi-

lising even when possessed by the two superpowers, and the theology of deterrence their strategists peddled offered little succour to the millions of people around the world worried about the danger of nuclear holocaust. Nuclear weapons are not acquired for deterrence but for the hegemonic value they confer as currencies of power. In the South Asian context, even if overt nuclearisation combined with the doctrine of deterrence does not lead to atomic war, it is likely to delay indefinitely the prospects of normal state-to-state relations between India and Pakistan. The premise of deterrence is the possibility that a nuclear first strike might one day happen despite the irrationality of such a strike in military terms.

**B**ut as Cori Dauber argues, 'the problem is that worst-case analysis can lead to self-fulfilling prophecies regarding international relations... in which there is no real place for discourse. Even as summits, meetings, negotiations and other forms of discursive communication are increased, they are dominated by a perspective that believes these activities to be side-shows.'<sup>26</sup> In other words, talk is cheap. It is only weapons that really matter. So long as Indian and Pakistani elites remain possessed by the deterrence mindset, they will be locked into a situation where negotiations on substantive issues are considered unimportant. And the same applies to Sino-Indian relations as well. What needs to be grasped is that it is friendly relations, and not nuclear weapons, which provide the most durable security.

Where does all this leave us?  
The nuclear tests have heightened ten-

sion in South Asia. They have not served to enhance the national security interests of India and Pakistan, either in the broad sense of the well-being of the population or even in the narrow sense of state security. True, Pokhran II has not led to the kind of isolation of India the US and China would like to see internationally, mainly because of popular revulsion against the hypocrisy of the five nuclear weapon states. But nor have there been any expressions of solidarity with New Delhi. Nuclear weapons have been flaunted in order to assert a claim to a larger global role but it is not certain that the tests have given Indian elites the kind of clout they desire. If India stands a chance of truly making its mark on the world stage, it can only do so by making a clean break with the 'big power' mindset that has gripped it since the days of Rajiv Gandhi or even earlier.

**T**he world is sick and tired of nuclear-armed, big powers throwing their weight around, intervening wherever they feel like and imposing their will on small countries. The world does not need another big power of this kind. If India simply wants recognition as a nuclear weapon state, it will be reviled in the world. If it challenges the unequal world order in order to make it genuinely democratic, it will win respect and adulation. As for Washington, it will have to reconcile itself to the fact that the challenges to its 'non-proliferation regime' will only mount over time, especially since the US dominance which this regime is meant to symbolise and underpin is steadily being eroded by economic and political developments. Either it agrees to disarm, as the world is demanding, or else it will hasten the day when a devastating nuclear conflict eventually will break out.

# Living a nuclear life

ZIA MIAN

THE government's of Pakistan and India have thought and done the unthinkable. With the nuclear weapons tests they have demonstrated a willingness and a capability to commit nuclear mass murder. They are now not simply murderous states but genocidal ones.

This was not done with universal consent. There was a nuclear debate. But there should have been no need for one. Nuclear weapons have become the one great exception in the sense that

there are some issues that a society should never need to debate because the issue itself is so unethical.

When it comes to nuclear weapons, however, the moral response has been dulled. This is because the question is never posed in moral terms. It is easy to do so: is it right or wrong to be prepared to kill hundreds of thousands, perhaps millions of people in the blink of an eye, to maim many more and to poison them with radiation so that they die slowly and painfully over

3:

the years from cancers and other illnesses. The experience of Hiroshima should have been enough to convince anyone that there can only be one decent answer to this question: nuclear weapons are an affront to humanity.

**S**o why has there been a worldwide debate about nuclear weapons for over fifty years? It has happened in large part because the reality of nuclear weapons is presented in the language of security, strategy and technology. The issue is framed as one of deterrence, compellence, first-strike, second-strike, counter-force, counter-value, primaries, secondaries, pits, tampers, yields, throw-weights, CEPs. Each word, each idea, points only to another in the same language, and in this language there are only reasons and numbers. These are further detached from reality by renaming things; the US nuclear war-fighting plan is called the 'Single Integrated Operational Plan', the MX missile is called the 'Peace-keeper'. In all this, there is no word for man, woman, child, pity, remorse, or even death.

From the very beginning of the nuclear age there has been a tendency to use language that hides the reality of what is being considered. But it is more than simply a disguise. Language is used as an anaesthetic, as a way to deaden feeling. Without feeling, morality becomes an abstraction and withers away. These are the first casualties of nuclear weapons.

Nowhere is this more evident than among those people whose job it is to deal with these weapons on a daily basis. The American scientists who built the first ever nuclear bomb simply called it the 'Gadget', as if it were just another strange invention rather than the most destructive weapon that had ever been made. When the time came to kill people with these

weapons, the scientists and soldiers involved found the most innocuous names possible for the weapons: the bombs that destroyed the Japanese cities of Hiroshima and Nagasaki were called 'Little Boy' and 'Fat Man'.

This refusal to confront the reality of nuclear weapons is not confined to the United States. It has afflicted every state that has developed them. The Soviet Union named its first bomb the 'Article'. Britain called its first nuclear explosion 'Hurricane', France had the 'Blue Mouse', and China named its first nuclear weapon simply 'Device 596'. The same escape can be found closer to home; India christened its nuclear bomb test in 1974 'Smiling Buddha' and more recently 'Shakti'. All of this illustrates what psychologist Robert Jay Lifton has called 'nuclear numbing', the process by which 'we domesticate these [nuclear] weapons in our language and attitudes. Rather than feel their malignant actuality, we render them benign.'

**P**akistan has its own way of talking about its nuclear weapons without really talking about them. For more than a decade, while it lacked a nuclear bomb that it could name, the debate in Pakistan was only about a 'nuclear option' or a 'nuclear capability'. There was never a mention as to what it was an option for. So used are Pakistan's scientists to a nameless bomb that they have not yet given a name to the nuclear tests.

If the nerve of moral outrage is only dulled, there is hope that the sharp prick of knowledge can serve to revive it. Laying out the enormity of what is involved in Pakistan's nuclear tests can serve this purpose. Pakistan is believed to have tested a simple nuclear weapon of the kind used 52 years ago against Hiroshima. In Hiroshima, the atomic bomb killed between

210,000 and 270,000 people and destroyed more than 90% of the city. Pakistan's nuclear tests were a demonstration that it could do the same thing to one or more of India's major cities.

Despite the moral argument against nuclear weapons, there has been public support in the countries that have built these weapons. This is not because people woke up one day and wanted nuclear weapons. Public support for them was built by creating a sense of crisis and fear. There is no doubt about the overwhelming elite support for nuclear weapons in Pakistan and that this is shared by large numbers of ordinary people. The nation-wide celebrations of Pakistan's nuclear tests are sufficient proof. This level of support, according to opinion polls, has not changed for over a decade. This is remarkable. In one of the most tumultuous periods in Pakistan's history, where military dictatorship gave way to elected government, governments came and went, economic policies changed, the Cold War ended, the Soviet Union collapsed, and the United States imposed sanctions on Pakistan because of its nuclear weapons programme, nuclear weapons have remained almost beyond question.

**T**here are many reasons behind this massive and inert support for nuclear weapons. One is that most people know little if anything about nuclear issues. This is an obvious inference from polling data showing that support for nuclear weapons in Pakistan is constant regardless of educational attainment. From the illiterate to those having only a basic education to those with degrees, about the same proportion support these weapons. That the nuclear debate is starved of information is evident one only has to look at newspapers, magazines and the electronic media.

What people are told is rarely more than an assertion that nuclear weapons are vital. This is a second reason for the strong and enduring support for nuclear weapons. For over a decade, Pakistanis have heard nothing but repeated public declarations by all their presidents, prime ministers and military leaders that nuclear weapons were vital for the 'national interest'. When arguments are presented in this manner it is no surprise that people conclude the nuclear weapons are Pakistan's last and only hope. It is this that explains Nawaz Sharif's remarks on Pakistan television after the tests; he said it was an 'auspicious day' and the decision to test was 'a crossroads... [with] one way towards slavery, the other towards freedom.'

**I**t is not just an abstract support for nuclear weapons that is created. Pakistan's politics and culture is too charismatic and physical for that to succeed. Nuclear weapons have been personified. For years they have been embodied in A.Q. Khan, who led the uranium enrichment project used in the making of Pakistan's nuclear weapons. He has become a national public figure, appearing on television and making speeches at all kinds of public events. For the head of what is meant to be a secret military project, this has few precedents anywhere in the world. Others have now joined him from the Pakistan Atomic Energy Commission.

A fourth reason for the support to nuclear weapons is that the opposition has been stifled. For years, there has been a deliberate orchestration of hate in sections of Pakistan's media against individuals and groups who argued against nuclear weapons. This hate is by no means exclusively reserved for them, but its intensity is remarkable. To take only one example, in February 1996 the Islamabad branch

of the Pakistan-India People's Forum for Peace and Democracy held a public meeting. It sought to suggest, with what now appears to be great foresight, that Pakistan should not engage in a nuclear or missile race against India. The following day, Urdu newspapers responded with banner headlines: 'People's Forum meeting: ridiculous speeches poking fun at Islam, abusing armed forces.' Within a few days this had turned into headlines declaring: 'Organisers of non-governmental dialogues between India and Pakistan are not patriots.' And then, politicians jumped in to add that this was a case of treason, and if the government would not act to prosecute such traitors, people should take the law into their own hands. After the tests, some people did. On 2 June, at a press conference in Islamabad, members of the Forum were attacked.

**M**ost of all, nuclear weapons need an enemy to make them worthwhile. For decades, India has been projected as an absolute and unremittingly hostile enemy, without scruple, willing to exploit every opportunity. It is the source of everything that has gone wrong in Pakistan. An Indian hand is identified behind every untoward event. Any challenge to the *status quo* is interpreted as an Indian conspiracy against national security. India, it is said, cannot be talked to or reasoned with; it must be confronted.

This is the environment within which the nuclear tests took place. Having created a public opinion obsessed with nuclear weapons, it was only too easy for Pakistan's leaders to claim that they had no choice and that it was public opinion that demanded the tests. It was easy and may have sounded convincing. It should not have. Public opinion in Pakistan has demanded many things like an end to poverty, schools for their children,

hospitals, but no leader ever risked the future of the state to try to provide these.

The cost of a nuclear weapons programme is far greater than simply the withering of morality and the corruption of language and politics. The financial costs are great; this is why they are kept secret. In Pakistan, even estimating the cost is difficult. Part of the problem is that disentangling the money spent on the nuclear weapons programme from that spent on the Pakistan Atomic Energy Commission (PAEC) is practically impossible. That they are tied together is indisputable. As he doled out credit for the nuclear test, Prime Minister Nawaz Sharif said, 'The entire nation takes justifiable pride in the accomplishments of the Pakistan Atomic Energy Commission, the Dr. A.Q. Khan Research Laboratories and all affiliated organisations.' Incidentally, for PAEC this was illegal. It is bound by its charter to work only on the peaceful uses of nuclear energy.

**A**t a more material level, many of the nuclear scientists and engineers who worked on the bomb programme must have received their training at the PAEC, and are seconded from it. There are apparently 'seven thousand highly skilled and professional people, including more than two thousand Ph.Ds, M.Phils, MSs, MScs, BScs at Kahuta. Similarly, the uranium that is mined and processed at Dera Ghazi Khan has been used by both to make fuel for the KANUPP nuclear reactor in Karachi and to make nuclear weapons material at Kahuta. Since the nuclear power plant at Karachi is dangerous and old, and has only produced a fraction of the electricity it was supposed to, it is possible to imagine that it is kept open as no more than a fig-leaf for the nuclear weapons project. In which case a large share of the PAEC budget,

greater than the Rs 6 billion budget of PAEC over the last two decades, may have directly or indirectly subsidised the nuclear weapons programme.

To these costs must be added the military spending in Pakistan, part of which also subsidised the nuclear programme. In this year's budget, military spending has been set at Rs 145 billion. This is 40% of what the government expects to receive in taxes, and 30% more than what has been allocated for development. For the record, 1990 was the last year in which military spending was equal to the budget allocation for development.

**T**he effects of persistently lower than necessary development spending is cumulative. Each generation which is deprived of decent healthcare and housing, education and employment, is less able to provide these for the generation that follows. There is a spiral of underdevelopment. That this is at work in Pakistan is evident from the fact that on the United Nations Development Programme's aggregated measure of the quality of people's lives in different countries, the Human Development Index, Pakistan has slipped from number 120 in 1992, to 128 in 1995, to 134 in 1996, and in 1997 was ranked 139 (and is now below India).

To all this must be added the direct and indirect cost of the sanctions imposed on Pakistan in response to its nuclear tests. This may amount to billions of dollars of aid and loans. Frankly, much of this would have been squandered and used to enrich the already wealthy and provide them with even greater comforts. But at least some would have gone to supply water, perhaps build schools, hospitals, roads – something that would have helped.

It is unclear how long sanctions will remain in force but even when

they are lifted, Pakistan will only be back to where it is now. The fact is that to begin creating the conditions within which real development can take place will need massive reductions in military spending. Such reductions cannot, however, take place as long as India is treated as a threat requiring nothing less than a willingness to use nuclear weapons against it and, in response a willingness to have nuclear weapons used against Pakistan. If national nuclear suicide is being offered as the only way to confront India, any reduction in military spending will be seen as subtracting from national military capability. It is only by engaging in nuclear disarmament, and so demonstrating that relations with India are not being interpreted as issues of life and death for the nation, that it will become possible to debate military spending.

**T**he whole process of creating and maintaining even a small nuclear weapons arsenal like Pakistan's exacts a terrible toll on people's health and on the environment. There is increasing evidence from around the world that from the moment uranium is dug out of the ground to the disposal of long-lived radioactive waste that is dangerous for tens of thousands of years, the materials that form the essential ingredients for nuclear weapons bring with them sickness and death.

The first public evidence of the human and environmental damage done by the nuclear programme has already emerged. It is to be found in Dera Ghazi Khan, the site of Pakistan's first, and for a long time its only, uranium mining and processing operation. Officially part of the PAEC, this is also where workers mined the uranium that went to Kahuta to make nuclear weapons. In 1996, the 500 or so workers at the plant went on strike, demanding 'payment of compensa-

tion to the heirs of the employees [who] died during their duty or became handicapped, provision of all necessary safety measures both at the plant and at the site, and sacking of the doctor and lady doctor of the PAEC dispensary, as due to their incompetence several employees lost their lives.' The government's response was draconian. Newspapers reported that 'Security guards of PAEC and other law enforcing agencies have besieged the colony and all installations. No one is being allowed to enter or come out of the area.'

**T**hat the first strike over health and safety issues in part of Pakistan's nuclear complex broke out at Dera Ghazi Khan is not at all surprising. Uranium is both radioactive and poisonous; handling it in any form is fraught with risk. But, unlike in a laboratory where highly trained scientists who know the risks involved may handle tiny amounts of such dangerous material with relative safety, the mining and processing of uranium ore is an industrial scale operation. Its labour intensive character leads to exposing large numbers of relatively unskilled workers, who know little about the short or long-term risks that they are being subjected to. The dangers to health are substantially increased in such a setting.

Briefly, the process of turning the tiny amounts of uranium found in some rocks into large amounts of pure uranium that can be used to make fuel for nuclear reactors or for nuclear weapons requires that huge amounts of rock need to be dug out of the earth, pulverised into dust and chemically processed. The uranium ore emits radiation and exposes anyone close to it even before it is taken out of the ground. Digging up the ore releases radioactive gases that are trapped inside the rock, adding to the risk. The

ore has then to be crushed and the waste rock removed. The crushing produces a radioactive and poisonous dust that can be inhaled, that settles on clothes, in hair, and on the skin. Because it is so fine, it is blown by the wind and settles in the surroundings – on grass, leaves, and water – contaminating everything.

**U**ranium mining, in the first stage, leaves behind as waste over 99% of the rock in which the uranium ore is located. This contains most of the radioactivity and many toxic heavy metals as well as the acids and alkalis used to extract the uranium. These can leach into the soil and groundwater. Because it is generally processed away from the mines, the ore has to be transported to the processing plant. This is often done after the ore has been substantially crushed and some of the waste rock removed, leaving less material that needs to be transported.

If the ore is transported in open trucks, the uranium dust may well be blown around *en route*. Once at the processing plant, the rock is further crushed and ground. But even though the total amounts of material are now smaller than at the mine, the risks of inhaling even small quantities of dust are larger. The impact on the uranium miners and the local environment of such waste is enormous.

The dangers do not end here; they just move on to another site. The next step is transforming the uranium into a gaseous form that is suitable for enrichment at the Kahuta facility. This involves the use of highly corrosive and toxic chemicals that react violently with moisture in the air and are fatal if inhaled. Once the uranium is enriched and can be used to make nuclear weapons, it leaves behind a radioactive, toxic and corrosive waste. This waste comprises almost

all of the initial material and needs to be disposed off safely. It is usually stored as cylinders of gas at the enrichment plant, but these will eventually degrade and lead to an environmental disaster.

There is no information about what has happened at the Kahuta plant with regard to health and safety issues or how the waste is dealt with. The US, which invented many of the processes and technologies used in making nuclear weapons, is still struggling to come to terms with this kind of waste from its nuclear weapons programme. A 1997 report claims that the giant steel cylinders containing this waste gas are so radioactive that even the dust that forms and then falls off the outside is treated as 'dangerous waste'. The cylinders, despite being over one-third of an inch thick, have corroded, and some leak, and 'every time one leaks, as some have, it releases puffs of toxic gas and uranium that can end up in the groundwater.'

**P**akistan also has a new nuclear reactor at Khushab, on the banks of the Jhelum river. Its sole purpose is to produce plutonium for making nuclear weapons. If this reactor has an accident it could pollute the entire Indus river with radioactivity and thus poison irrigation and drinking water drawn from it. Even if there is no such catastrophic accident, the process of extracting the plutonium from the fuel after it comes out of the reactor, known as reprocessing, generates large amounts of dangerous radioactive waste. The US Department of Energy, responsible for making US nuclear weapons, has estimated that reprocessing accounts for 85% of the radioactivity released in the nuclear weapons production process, 71% of the contaminated water, and 33% of the contaminated solids.

These wastes are so dangerous that they need to be stored safely for at least 1,000 years to make sure they do not get into the environment.

As long as Pakistan retains its nuclear weapons, it will need to keep at least some of these sites open. If, as seems plausible, it starts to increase the size of its nuclear arsenal, more and more sites will become part of the nuclear weapons complex and more communities exposed to the dangers of radioactive waste. These dangers, and any accidents that may occur, will most certainly be kept secret.

**I**t is only by renouncing nuclear weapons that damage can be stopped. The sooner this is done, the less chance there is of more workers being exposed to radioactivity and of further damaging the environment. Once this is done, there will be no need to keep these places secret. The process of assessing the harm that has already been done and cleaning up the mess can be started.

To those who want to keep nuclear weapons, the moral, political, economic and environmental destruction wrought by making and keeping nuclear weapons are outweighed by the supposed strategic guarantee of national sovereignty that the bomb provides. They argue, as Nawaz Sharif has done, that everything pales besides the need of the nation to live with self-respect; he claimed that now, 'Pakistanis are a self-respecting and honourable people who can sacrifice their lives to protect their honour and dignity.' The question for all those who support nuclear weapons is: Where is the self-respect, honour and dignity in thinking about and being willing to kill hundreds of thousands, if not millions, of people? What kind of *self* is it that needs such destruction as a mark of respect?

# Coping with nuclear reality

IFTEKHARUZZAMAN

THE Indian nuclear tests of 11 and 13 May 1998 showed New Delhi's determination to force itself into the 'exclusive club' of nuclear weapon states (NWS). Pakistan replied in kind on 28 and 30 May as a show of its own ambition to achieve parity with its arch rival. In forcing entry into the exclusivity India played according to the membership rule of the club, i.e., *might is right*. Pakistan followed the same route.

The tests were received in both countries by unprecedented national

euphoria and pride, although as subsequent events showed, these did not take long to dissipate. Thanks to the 'patriotic' fervour which equates the bomb with national prestige, the common Indian and Pakistani ignored common sense and joined the elite – politicians, intellectuals and other professional cheerleaders in celebration. India has apparently chosen to give up its patents on non-violence and *panchshila*. The tests even led to an enthusiastic reinterpretation of Gandhian non-violence as something for the brave and not for cowards, claiming that India would now be able to take a strong stand before the world

\* The views expressed are the author's own and may not necessarily reflect any official position.

community.<sup>1</sup> Immediate popular reaction in Pakistan was equally jingoistic, if not worse.

It is not known if the Indian shift, followed by Pakistan's, from a long-standing position of nuclear ambiguity to the present status of self-proclaimed NWS, followed careful consideration of the strategic, political and economic costs compared with advantages of ambiguity. Be that as it may, the reality today is that India and Pakistan have become the first two in a line of contenders to the nuclear club.

The gravity of the new strategic situation in South Asia and the risks involved in the brinkmanship that both have indulged in needs no great elaboration. What should be recognized at this critical stage is the gap between the desirable and the possible. What is most desirable is a roll-back to the pre-May 11 situation – which is rather unlikely. What is possible is to find ways to prevent a further worsening of the situation and to learn to live with the reality.

The reason a roll-back scenario is considered unlikely is simple. Pakistan would rather 'eat grass' than renounce its nuclear option unless India does so, and India would not do so before China and other NWS make definite progress towards complete elimination of their nuclear weapons. Whereas Pakistan's nuclear weapons programme is a direct response to India's, the latter's nuclear ambition is only partially addressed to security threats from within or outside South Asia. It is to a greater extent linked with the global nuclear weapons problem.

To be sure, notwithstanding India's long-standing advocacy of global nuclear disarmament, its nuclear

aspiration has been carefully nurtured throughout the post-independence period. The international role that a state strives to play is essentially a function of its power capabilities and its elite's perception of such a role. In case of India too, its perceived destiny and capacity as a 'great power' has shaped New Delhi's foreign and security policies and actions. Genuine or not, proud of India's power potential – physical size, population, economy and resource base, industrial and technological strength, strategic location, democratic institutions, historical past – the Indian elite has always aspired for a great power role.

India's leading initiatives in the non-aligned movement were to a great extent guided by its aspiration to play a role of global importance. Nehru was a great exponent of non alignment; he also gave expression to this perceived great power role of India, though it was often masked in moral language. In the words of Nehru: 'India will always make a difference to the world; fate has marked us for big things.... Leaving the three big countries, the United States, the Soviet Union and China aside for the moment, look at the world... if you peep into the future... the obvious fourth country in the world is India.'<sup>2</sup>

The reference point for India is not only its neighbourhood but the great powers. Nehru was a genuine supporter of nuclear disarmament. But he also inspired successive generations of Indian political leaders not to accept any status lower than of those with whom India considers itself at par. Recall that it was Nehru who approved the Indian plutonium reprocessing capacity to make available the

plutonium used for the 1974 peaceful nuclear explosion.

It was under Nehru and Lal Bahadur Shastri that India insisted on creating an independent nuclear industry base. Indira Gandhi ordered the PNE. Under Rajiv Gandhi, the research reactor Dhruva was commissioned which provided the source of weapons grade plutonium. Under Narasimha Rao, a nuclear test was reportedly to take place in December 1995. I.K. Gujral, notwithstanding his gestures for peaceful relations with neighbours, was not known for any particular opposition to India's nuclear weapons programme. Hence, what the present Hindu fundamentalist BJP-led government has done is a culmination of a process of continued activity by all previous governments. This was confirmed by leaders of the BJP as well as other political parties, including former Prime Ministers I.K. Gujral and H.D. Deve Gowda. The latter claimed that it was a result of cumulative efforts of the last 45 years and a matter of timing.<sup>3</sup>

Arguably, the speed at which the BJP-led government went ahead with the tests surprised many analysts and experts. One obvious explanation for the timing could be the problems that the coalition government faced in holding itself together. Judging by the reaction of Indians from all walks of life, there is no doubt that the tests gave it a badly needed breathing space, though, as expected, it didn't take long for its political allies like Jayalalitha to resume her act. But beyond that, India's nuclear aspiration as an instrument to ensure its long-standing desire to emerge as a power of global importance is nothing new. The present government only decided to go ahead with greater speed than expected.

1. *The Hindu*, Madras, 20 May 1998.

2. Quoted from Baldev Raj Nayar, 'A World Role: The Dialectics of Purpose and Power', in John W. Mellor (ed), *India: A Rising Middle Power*. New Delhi, 1981.

3. *The Hindu*, 15 and 20 May 1998.

Prime Minister Vajpayee, indeed, echoed Nehruvian determination to achieve major power status when he said in Parliament: 'India is now a nuclear weapon state. This is a reality that cannot be denied. It not a conferment that we seek; nor is it a status for others to grant. It is an endowment to the nation by our scientists and engineers. *It is India's due, the right of one-sixth of humankind*'<sup>4</sup> (emphasis added).

It is important to realize that Indian security, its strategic concerns and objectives are both regional and extra regional, that New Delhi is not prepared to accept being a nuclear outcast as long as other contenders for a global role have the weapon in their possession. From the Pakistani standpoint, the Indian position is a convenient excuse to pursue its nuclear weapons programme.

It is widely believed that international sanctions on India and Pakistan would not cause a major collapse of their economies, especially the former. As recent reports suggest, in the case of Pakistan, sanctions can indeed deal its fragile and externally dependent economy a devastating blow with severe implications for political stability of the country. But the linkage of nuclear capacity with national pride not only accounts for the emotions at the national level but could also render the financial and other costs bearable. On the other hand, the countries that slapped the sanctions, particularly the United States, are already showing a realization that these are not cost-effective from their point of view either. Hence, like it or not, the task ahead is essentially a question of how to live with the

reality of the nuclear threat in South Asia.

What lies ahead? Quite clearly, the effort of the international community to arrest the spread of nuclear weapons has failed. The nuclear tests by India and Pakistan also threaten the relevance of the NPT, irrespective of whether or not it is possible to renegotiate the treaty and increase the number of the nuclear weapon states to six or seven or more. The dilemma is that the parties to the NPT cannot ignore the implications of the emergence of new nuclear weapons states, even as they find it difficult to open the treaty for renegotiation.

Since the tests, India and Pakistan have sent signals that they may be willing to negotiate signing of the CTBT, though India has expressed that it would join only under conditions that have not yet been specified. Most of the NWS have, however, urged them to do so unconditionally. Notably, much of the initiative taken by the international community concentrates on India, the understanding being that if and when India is persuaded, Pakistan will follow suit. If India asks for changes in the CTBT and NPT, it would obviously pose a difficult dilemma which the international community must be prepared to face.

While by joining CTBT and possibly signing a no-first use agreement, India and Pakistan could avert further international condemnation, such developments would at the same time imply the gradual international acceptance of the new reality. Indeed, the NWS, especially the US, may find it convenient to maintain a stable relationship with India and Pakistan with a proven nuclear weapons capability rather than confront them. Notably, a study conducted for the US Air Force by the Rand Corporation, widely con-

sidered as the Pentagon's think-tank, suggested in March 1998 that the Indian subcontinent may be the one rare exception where regional security may actually be enhanced by tolerating some level of nuclear weapons proliferation. Arguing that the US had few incentives to offer that could obviate the desire of the regional states for nuclear weapons, the study recommended that the US might find it worthwhile to tolerate some movement on the part of the South Asian states toward low but relatively stable levels of nuclearization, if that is seen to enhance local stability.<sup>5</sup>

International efforts to confront the South Asian nuclear question should proceed with a premise that contrary to prevailing western perception, any country that has achieved technical expertise to produce nuclear weapons should also be expected to have the skills and political acumen to manage this capability, with or without weaponisation. Not everything has been lost as yet. Fortunately, by all indications, South Asia still appears to be far from the doomsday scenario as both India and Pakistan are still way behind actual weaponisation and deployment.

If nuclear tests by India and Pakistan are an indicator of the future, it must be remembered that nuclear non-proliferation and test bans cannot be pursued in isolation from nuclear disarmament. The international community requires firm, unequivocal and time-bound commitment on the part of NWS to eliminate nuclear weapons leading to global nuclear disarmament. The Canberra Commission declared: 'Nuclear weapons are held by a handful of states which insist that these weapons provide unique security benefits, and yet reserve uniquely

4. 'Suo moto statement by Prime Minister Shri Atal Bihari Vajpayee in Parliament on 27th May, 1998,' circulated by the Indian High Commission in Sri Lanka, para 10.

5. Quoted in *The Daily News* (Colombo), 23 March 1998.

to themselves the right to own them. This situation is highly discriminatory and thus unstable; it cannot be sustained. *The possession of nuclear weapons by any state is a constant stimulus to other states to acquire them*'<sup>6</sup> (emphasis added).

Whatever may be the stated compulsions, the Indian and Pakistani tests provide clear evidence of the validity of the above statement. The Advisory Opinion of 8 July 1996 issued by the ICJ stated with reference to Article VI of the NPT: 'There exists obligation to pursue in good faith and bring to a conclusion negotiations leading to nuclear disarmament in all its aspects under strict and effective international control.'<sup>7</sup> The Canberra Commission identified a series of specific steps for global nuclear disarmament. One possible way forward in the present context is that India and Pakistan unconditionally agree to sign the CTBT and freeze their nuclear programmes at current levels without further weaponisation or deployment for an agreed period, while during this agreed period the five NWS should also come up with a specific commitment on a timetable for global nuclear disarmament.

**T**he most obvious implication for South Asia is that a totally new strategic situation has arisen where the possibility of a nuclear disaster will always remain real. The peoples of the region have been brought closer than ever before to the brink of disaster. The smaller countries of the region have been thrown into a state of helplessness and despair. The prospects

of improving trade and economic relations between India and Pakistan within or outside the framework of SAARC (South Asian Association for Regional Cooperation), about which there were high expectations recently, have been shattered. Any notion about economic ties working as a confidence building measure in the region has now been rendered irrelevant.

**W**hether or not the region faces a direct nuclear catastrophe, there will certainly be a balance of terror. An indication of this was provided in the way the smaller states of the region responded to the tests. Countries like Bangladesh and Maldives reiterated their commitment to a nuclear weapon-free world, but refrained from making any direct comment on the Indian and Pakistani tests. Sri Lanka went to the extent of almost fully endorsing India's 'right' to conduct the tests. It did so largely because of an incapacity or will to antagonize India. The concern that it would be penalized in its bilateral relations should it take a stand not liked by India, no doubt shaped its reaction.

But it also did so because of an absence of any legally binding international instruments. There is no assurance from the nuclear weapons states that they will not attack or threaten to attack a non-nuclear weapons state (NNWS) with nuclear weapons, as well as assurances of coming to their defence if someone does so. The absence of such an instrument is particularly unjustified after the historic advisory opinion of the International Court of Justice, that the use or threat of use of nuclear weapons will be contrary to international law. The Indian and Pakistani tests have once again underscored the need to redouble international efforts towards a universally binding international legal instrument to provide specific

and complete security assurances to non-nuclear weapons states.

At the regional and international level, all eyes are focused on the Colombo summit meeting of SAARC, which is expected to provide the first opportunity to the prime ministers of India and Pakistan to meet and discuss ways of reducing tensions. However, if any movement in that direction does take place in Colombo, it will be on the sidelines of the SAARC agenda which cannot include discussion on 'bilateral and contentious' issues.

Be that as it may, the summit could turn out to be a disappointment for those expecting a dramatic breakthrough. Neither India nor Pakistan will come to the summit for any love of regional cooperation. If anything, their objective will be to avoid being seen as the one responsible for jeopardizing the SAARC process, not that they have not already done so. In all probability the meeting will be remembered as another round of rhetoric. Realistically, one possible outcome could be for the two to resume their stalled official level talks.

**T**o be sure, there have been instances in the past where the two used the opportunity of the SAARC meeting to discuss bilateral disputes. They may, indeed, do so this time too, but it is doubtful if they will go beyond the usual verbiage and polemics. When India approved the dates for the summit there were signals that New Delhi would like to see the summit concentrate on economic cooperation, as though having conducted the tests India and Pakistan are now mature enough to shelve political differences for the sake of economic cooperation. It would be ideal if they decided to do so. Unfortunately, while desirable it is unlikely. But the real message from New Delhi was clear: Don't raise anything for deliberations under SAARC

6. Canberra Commission on the Elimination of Nuclear Weapons, *Report of the Canberra Commission on the Elimination of Nuclear Weapons* (Canberra, August 1996, p. 7).

7. Quoted in Jayantha Dhanapala, A Strengthened Review Process for the NPT, paper presented at an international seminar held in Kyoto in December 1996.

that can be classified as bilateral and/or contentious.

For its part, Pakistan demanded that SAARC should address the tensions resulting from Indian and Pakistani nuclear tests. Islamabad cannot be unaware that any attempt in that direction will be opposed by India's 'religious' adherence to the policy of bilateralism. On an optimistic note, the SAARC forum could help the two realize that the nuclear tests and the ensuing unprecedented war of words, can only do harm and no good to themselves and to the rest of the region.

**T**he smaller countries of the region can take the opportunity of the Colombo summit, especially their meetings in 'retreat', to clearly voice their concerns and provide a more specific response to the problem. As mentioned earlier, fearful of the implications in bilateral relations, their initial reaction to India-Pakistan tests have been hesitant, to say the least, though subsequently some initiatives were taken to articulate their position.

Maldives made the first genuine expression of concern when the situation arising from the tests was cited as the reason for the postponement of President Gayoom's proposed visit to Delhi and Islamabad as the outgoing SAARC chairperson.

The prime minister of Bangladesh was the first head of government to visit India and Pakistan after their nuclear tests. Early reports on visit suggested that Bangladesh proposed exploring ways of easing tensions between the two. In separate letters addressed to her Indian and Pakistani counterparts, she wrote, 'I would be very happy to visit your great country at an early date to discuss the situation arising out of the nuclear tests...' A section of the me-

dia in Bangladesh reported that the possibility of mediation was also considered.

Talking to the Overseas Correspondents' Association of Bangladesh, Prime Minister Sheikh Hasina reportedly said that she had 'offered a proposal for mediation to ease tension caused by nuclear tests by India and Pakistan.' Eventually, the visit proved to be anything but mediation. It was not unknown to Bangladesh that mediation was the last thing that would be acceptable to New Delhi on any matter of dispute. Nevertheless, the message of Bangladesh's concern as a small neighbour was clear, as was its eagerness to play a pro-active role in promoting dialogue and reducing tension between the two.

**T**his needs to be followed up severally and jointly by the South Asian NNWS. In the interest of regional stability and cooperation, NNWS of South Asia should strive to take a more active role on the issue. They should consider a sub-regional South Asian initiative – within or outside the SAARC process – to prevent nuclear weaponisation and deployment by India and Pakistan.

The SAARC, the United Nations, the Non-Aligned Movement and other international fora should be used to persuade India and Pakistan to sign a binding legal instrument to ensure security guarantee for NNWS of South Asia against use or threat of use of nuclear weapons by any NWS, especially their regional neighbours. This provision should, indeed, be built into a no first use agreement that may be signed between India and Pakistan, and future confidence building measures aimed at promoting regional stability.

# A view from Nepal

KUNDA DIXIT

IF there was political fallout from the Indian and Pakistani nuclear tests, it did not reach the Himalaya. The Nepalis seemed more concerned about the occupation of a Himalayan valley called Kalapani on its north-western border with India by the Indian military and the alleged movement of border posts on the eastern frontier. For many Nepalis, brought up to believe that India's rulers have always been plotting to Sikkimise Nepal, the border issue reinforced the stereotype. Kathmandu newspaper headlines screamed obscenities at 'imperialist' India and political parties vied with each other for more virulent anti-Indian statements. The bombs were tested in the middle of this controversy. All it really did was give Nepalis a feeling that they were now dealing with a newly-nuclear India.

The Foreign Ministry in Kathmandu issued a mild expression of concern about the nukes while the leader of the ruling Nepali Congress, Krishna Prasad Bhattarai, said he was glad India had finally tested the big one because 'a strong India is good for Nepal.' When Pakistan tested its bombs, Bhattarai was asked by reporters whether a strong Pakistan was good for Nepal too, and he seemed to be uncharacteristically at a loss for words. Indian President K.R. Narayanan happened to be in Kathmandu on a state visit while all this was going on; there were some peace supporters who took to the streets and raised slogans outside the Indian Embassy.

Other than that, or the punditry in the op-ed pages and predictable vehemence from regular India-baiters,

there was no real outrage, no sign of a movement for regional disarmament, no revival of the discredited panchayat-era call for Nepal to be declared a 'zone of peace'. If there was any reaction, it came in comments about the extreme bad taste and insensitivity to carry out the tests on Buddha's birthday. Nepal may be a 'Hindu Kingdom' but the Buddha was born in what is now Nepal and nearly one-third of the population is Buddhist. A headline in the Kantipur Nepali daily seemed to sum up the mood: 'Earthquake, not nuclear bomb, more dangerous for Kathmandu.'

Much of this ambivalence towards India comes not from fears of 'Sikkimisation' but from the gradual 'Finlandisation' of Nepal by India. Landlocked Nepal's overwhelming economic dependence on India and its close cultural and religious ties have always pushed Nepalis to bend over backwards to assert their independence. Nepal time is symbolically 15 minutes ahead of Indian Standard Time – it used to be only 10 minutes till 20 years ago. The love-hate relationship is seen in many dealings – the paradoxical effort by most political parties in Kathmandu to exhibit their opposition to Indian hegemony during election campaigns, but who immediately retract their vitriol once they come to power, shamelessly justifying it as made 'during the heat of campaigning.'

India itself, and especially its embassy in Kathmandu, hasn't given the Nepalis too many reasons to like India either. An unnecessarily belligerent statement by the Indian ambassador on Kalapani, even while a

bi-national committee was trying to resolve the issue, poured oil on the fires lit by Nepali activists. They marched to Kalapani but were turned back at the barbed wires, said to have been put up on Nepali territory by Indian border guards. Perceived high-handedness by New Delhi is usually magnified by a shrill Nepali press, reinforcing public perception that India is a bullying big brother. The way India has handled the Bhutan refugee crisis, refusing stubbornly to mediate, even though it seems to be in its own strategic interest to do so, has mystified Nepalis. Here is a case of 100,000 Lhotsampas from Bhutan being forcibly moved out to travel through Indian territory to live in squalid camps in eastern Nepal and New Delhi couldn't care less.

**I**ndia does not have to be so mean, and even though magnanimity may be seen as a sign of weakness it can afford a little bit of it – especially if it wins New Delhi the big prize: the possibility of harnessing Nepali rivers jointly for electricity, irrigation and flood control. The Gujral Doctrine was the way to go. But as things turned out, any deal on water issues with India is now doomed. Take the Mahakali Treaty, which was dead on arrival because neither side was prepared to first look at the political reality on the ground. In Nepal, no government (least of all shaky coalitions) will want to commit suicide by talking water with India – so strong is the historical memory of past irrigation projects, and so tempting is it for the opposition to whip up anti-Indian populism. Recent governments have tumbled at even the slightest whiff of 'selling out' to India. As economic dependence on India grows, there will be more gestures to show that Nepal is apart. But the rulers of the day in Kathmandu will have to be much more pragmatic and

gauge the cost-benefit ratio of taunting India for political mileage.

Nepal has in the past always leaned on China to neutralise its dependence on India. But this strategy outlived its usefulness with the India-China détente and the unspoken understanding between Delhi and Beijing that recognised Tibet as a part of China in exchange for everything south of the Himalaya being accepted as India's sphere of influence. But the sabre rattling by George Fernandes and labeling of China as 'threat number one' ended it all. A new trans-Himalayan cold war could revive the geo-political competition between Beijing and New Delhi over Nepal. In the past, Nepal benefited because it had a cool and calculating reigning autocrat like Mahendra, but in a messy democracy it could bring the danger of China and India competing for political influence in the Kathmandu *durbar* by destabilising each other's proxies.

**N**epal's unifying warlord, Prithvi Narayan Shah, knew it 250 years ago as he set about trying to carve out a country that stretched from Sikkim to Punjab. He likened Nepal to a yam between two stones. He was talking about Tibet/China to the north and British/Moghu/India to the south with the thin, long territory of Nepal in between. Nepal's rulers to the present day have retained this doctrine of vulnerability. Another analogy is of a mouse caught between two elephants – if the elephants fight the mouse is trampled; so too if the elephants make love.

Over the centuries, Nepal has tried to deal with this in different ways. Prithvi Narayan's descendants put Nepal on an expansionist mode and immediately collided head-on with a similarly expansionist East India Company. After three bloody wars,

Nepal finally signed a treaty with the Company in 1816 under which Kathmandu paid a heavy price for independence: ceding most its conquered territory, allowing the British to recruit soldiers (later called the *Gurkhas*) and allowing Calcutta to place a regent (actually a spy post) in Kathmandu to monitor and interfere with domestic Nepali politics.

**L**ater, the Shahs were sidelined in Kathmandu by their cousins, the Ranas. The first hereditary Rana Prime Minister, Jung Bahadur, became the first subcontinental royalty to pay a state visit to Britain in 1850. Jung was a pragmatic military tactician and he wanted to gauge the strength of the British and see whether it was worth going to war with them. After visiting the cannon foundries, the naval dockyards and the railways in the British Isles, he decided Britain was too strong to have as an enemy. So Jung became an Anglophile to the extent that he sent his army down to the Avadh plains to help the British out of a particularly tight corner that they had got themselves into with the Mutiny.

British India was happy with having Nepal not only as a buffer state against China, but almost as a vassal state. Nepal may not have been colonised, but who'd know the difference? And the Gurkhas were soon dying in Afghanistan alongside their British comrades – a pattern that continued through the world wars, in the anti-communist insurgency in Malaya, in the 1962 war with the Indian Army against China in Aksai Chin, and most recently in sailing down to the Falklands to mop up Argentinean landmines.

Nepal's relations with Tibet (and therefore China) suffered as a result of the British tilt and some campaigns against Lhasa ended in disaster as the Chinese came to the aid of

Tibet. In one case they even chased the Nepalis back into Nepal and massacred them in a battle north of Kathmandu. The uneasy peace with the North was enforced by the inhospitable nature of the high Himalayan frontier and in the South with the malarial Terai keeping away all but the most adventurous Europeans. The kingdom of Nepal existed in splendid isolation, and as the independence movement gathered strength in India, that is exactly how the Ranas wanted it.

**B**ut Nepali socialists who had socialised in British India began agitating, and it was only a question of time before the Rana oligarchs had to give way to the Shahs who promised democracy. However, independent India learnt early on that it was easier to exert influence in Nepal through its corrupt autocrats than a genuine functioning democracy. Prithvi Narayan's direct descendant, King Mahendra, dissolved Nepal's first democratically elected government and jailed Prime Minister B.P. Koirala in 1961, telling him, 'Nepal isn't big enough for the two of us.' B.P. Koirala, in his recently published memoir, recounts that when push came to shove Jawaharlal Nehru never really supported democracy in Nepal. And when the India-China war broke out in 1962, Mahendra shrewdly exploited India's tension with China and played one off against the other to gain development largesse and political clout.

Not since Prithvi Narayan, and not after Mahendra, has Nepal enjoyed such a degree of self-determination. True, Mahendra gave in to Indian demands, especially on river sharing agreements, but he also allowed the Chinese unprecedented access and got them to build highways and hydro-electric plants. King Birendra came to power trying to carry on his father's legacy. But the world was changing:

US-China rapprochement, the birth of Bangladesh, Indo-Pakistan tensions and an increasing clamour from the underground democratic movement meant that Mahendra's policies needed fine-tuning. Nepal lobbied and won the honour of hosting the SAARC secretariat and played an important part in the early years to try and make it a relevant regional body. But relations with India just kept getting worse with irritants like Nepal repeatedly voting against India at the UN and international fora, or Birendra's 'zone of peace' proposal which New Delhi felt was another case of upstart Nepal acting too big for its boots.

**I**n the end, it came to something as petty as a personality clash between Rajiv Gandhi and Birendra to put Indo-Nepal relations into a tailspin. There are several theories about this: protocol-conscious Birendra demanding royal treatment from Rajiv who saw himself as a Moghul emperor, or Kathmandu's alleged refusal to allow Sonia to visit the Pashupatinath temple during a SAARC summit, or a flap over a breakfast invitation at another summit in Islamabad.

Whatever the reason, New Delhi used the excuse of Nepal buying military hardware from China to clamp an 18-month blockade on its border with Nepal in 1988. For Nepal, with its trade dependence on India almost complete, this was economic strangulation. Nepal started flying in kerosene and petrol from Dhaka in civilian airlines hastily converted into flying tankers. Essential supplies ran out and the public mood turned angry. Looking for scapegoats, the people blamed their own government and as the grievances piled up, it snowballed into the democracy uprising of 1990. In hindsight, India had unintentionally triggered a democratic movement in Nepal.

The years since democracy was restored have been politically messy. Nepali freedom fighters, some of whom went straight from jail to the swearing in ceremony at the Royal Palace, showed themselves to be as self-centred, short-sighted, fractious and venal as the feudocrats they replaced. It did not take long for the euphoria of democracy to be replaced by the stench of political greed. Nepal's long-suffering citizens who had expected political freedom to be a panacea that would erase the effects of past plunder and neglect, bringing the hope of better living standards, were disappointed.

**T**oday, their patience has run out. As elected officials discredit themselves with political promiscuity, and fed up with an uncaring elite, people who have nothing left to lose have in some parts of the country been drawn by the extremist rhetoric of the Maoists. The government in Kathmandu continues to treat the Maoists as a law and order problem and in the time-honoured fashion of reactionaries everywhere, call them 'terrorists'. Unless this is seen as a political problem, an attempt made to bring the extremists to the political fold and to redress past neglect and apathy, support for the Maoists will only grow.

For Nepal, as well as for India and Pakistan, the real threat to national security is from within, from disenfranchised peoples who are fed up with tolerating oppression. South Asia must see human security and not the arsenal of their neighbours as the number one security issue. And unless the two big boys, India and Pakistan, call an immediate halt to their nuclear programmes, de-escalate the arms race and shift the money to development, the real issue will be the poverty bomb and not the nuclear bomb.

# Machismo, madness and a mess

L. RAMDAS

THE recent display of 'nuclear machismo' by the Sangh Parivar and the predictable response from Pakistan on 28 May '98 has left the sub-continent in a state of total dismay and disarray. The chieftains of the fundamentalists on both sides of the border have excelled themselves in jingoism and in threatening each other publicly. The minister for parliamentary affairs in the Government of India challenged Pakistan to a 'duel' as it were, soon after 13 May. This grand, perceived strategic superiority was short lived, for on 28 May the score was 'deuce'. Not to be outdone in jingoism, we had the foreign minister of Pakistan claiming that Pakistan would be able to win a war with India in 90 minutes!

The reasons for India's nuclear tests were ascribed to national security requirements. Nothing could be further from the truth. Indeed, the general scene in the immediate neighbourhood just before the elections in February '98 was stable and well under control.

Inder Gujral who was prime minister in the last government confirmed this on the floor of the House during the debate on the explosions. We need to look at all these and related issues to understand the impact of this misadventure.

There has been criticism, perhaps justifiably, that India has never really set for itself a national strategy from which must flow all other related strategies. This was to be the primary task of the National Security Council, to chalk out a 'national vision', examine various issues and to recommend a national strategy – political, socio-economic and military. This would have enabled us to evolve a nuclear strategy. As of now, we have nuclear weapons without a proper nuclear strategy. This is a dangerous situation to be in. Unfortunately, the government decided to pre-empt everything, and by setting off the bombs, made a mockery of the concept of a National Security Council.

National security represents all aspects of national interest which need to be protected, nourished, developed and sustained. Thus, military needs alone do not constitute national security. In the present context therefore, the expansionist militarism of the neighbours, namely China and Pakistan, which have been attributed as the main provocation for the decision to execute Pokhran II is not tenable.

**W**hat changed so dramatically between the time Inder Gujral vacated office and the time the BJP government came into being continues to be a mystery. It is most unlikely that the government made an in-depth analysis of the fallout of this decision. The only reason that may have driven them towards the edge of this precipice was that it would give India a great feeling of glory and power.

The nuclear tests have generated reactions worldwide and on the domestic scene. The overall reaction of the nuclear haves, especially that of the United States of America, was predictably negative. The announcement of sanctions too was equally prompt. Subsequently, the USA prevailed upon the P5 states and the G8 nations, and more importantly the UN Security Council, to condemn India for its action in Pokhran and, to a lesser degree, Pakistan for its reaction in Chagai Hills.

While we may wish to play down the impact of economic sanctions and complain about the discriminatory character of the CTBT, the fact remains that they are a reality. The total impact of all this is just beginning to surface. As was to be expected, most projects which will be affected have a bearing on the socio-economic sector. The list is long and worrying. The sanctions will also create difficulties for business houses in raising funds and loans from international

financial institutions for the many ongoing projects and those on the anvil. To avoid loss of face we may put up a brave front, but the shoe still pinches! Exports are likely to nose-dive in the near future and we may soon face a severe balance of payments problem. Our \$23 billion reserves will become less than half in no time, and that is when the real crunch will come.

The belligerent and aggressive image we have projected post Pokhran II has created a sense of fear in our neighbourhood, which will no doubt be exploited by the 'nuclear haves' and their close relatives! The few friends we have will now be more circumspect, and quite unwittingly we may even have created new enemies. The ASEAN nations, those in the West Asian rim and the Gulf countries will certainly feel uncomfortable.

**I**n short, what we have succeeded in doing is to create fresh security concerns. All this may result in our isolation and encirclement by like-minded nations in our neighbourhood. Clearly, we have brought this avoidable and ugly situation upon ourselves. A country which prided itself on its high moral standing has lost it by a single foolish act of this government. Despite the pronouncements of peaceful intent and dispatch of special envoys, our credibility has suffered badly; to restore our image to pre-May 11 state will take a long time.

Most disconcerting and damaging to our world image has been the recent resolution, passed unanimously by the UN Security Council, demanding and urging India and Pakistan to implement a long list of actions. Mention of items 5, 7, 13 and 14 will illustrate this point.

Item 5. Urges India and Pakistan to resume the dialogue between them on all outstanding issues, par-

ticularly on all matters pertaining to peace and security, in order to remove the tensions between them, and encourages them to find mutually acceptable solutions that address the root causes of those tensions, including Kashmir.

Item 7. Calls upon India and Pakistan to immediately stop their nuclear weapons development programme, to refrain from weaponisation or from the deployment of nuclear weapons, to cease development of ballistic missiles capable of delivering nuclear weapons and any further production of fissile material for nuclear weapons, to confirm their policies not to export equipment, materials or technology that could contribute to weapons of mass destruction or missiles capable of delivering them and to undertake appropriate commitments in that regard.

Item 13. Urges India and Pakistan, and all other states that have not yet done so, to become parties to the treaty on the non proliferation of nuclear weapons and to the Comprehensive Nuclear Test Ban Treaty without delay and without conditions.

Item 14. Urges India and Pakistan to participate, in a positive spirit and on the basis of the agreed mandate, in negotiations at the conference on disarmament in Geneva on a treaty banning the production of fissile material for nuclear weapons or other nuclear explosive devices, with a view to reaching early agreement.

**T**hese points made by the UN Security Council clearly indicate that the world body will not be inactive and let things slide. In all these years since 1965, the UN had not intervened to highlight Kashmir. Indeed, Kofi Annan was planning to remove it from the UN agenda, but the blasts have

changed all that. The reality is that the UN has now decided to mention Kashmir. The question before us is, can we afford to ignore these demands of the UN?

On the domestic front the anticipated magic did not work. In the recently concluded by-elections, the BJP has not fared too well. The so-called allies have not given them even an inch. Jayalalitha, Mamata Banerjee and now even the one-man party of Chandra Shekhar are after the jugular of this government. The Congress party has cooled down considerably since its initial supportive stance, and is waiting in the wings to step in. So the domestic political fallout has, if anything, been exactly the opposite of what was perhaps expected by the BJP. The minority government is now struggling to hang onto power!

**N**uclear weaponisation means additional costs to the defence budget. The compulsions will be many. We will need to have excellent command, control, communication, and intelligence systems which will be responsive to the new demands of nukes. We will also require excellent satellite surveillance, airborne early warning (AEW), and air defence and anti-missile missile systems. We will need the delivery systems – aircrafts, submarines, missiles and so on. The net effect of all this will be to further push up defence expenditure.

Needless to say, most of the resources will have to come from those earmarked for the social sector. The nation will now be left with even less resources for food, education, drinking water, health; in short for all those things we have promised our people since independence.

There are many other demands the military posturing will make on the overall economy of the country. The economists will no doubt elaborate on

the implications of the sanctions on exports, industrial growth, and foreign investments and infrastructure development. There is bad news most of the way, and in all probability it is likely to get worse.

**N**uclear weapons have unfortunately been given more credibility than their due in the mistaken belief that their possession automatically bestows on a nation status, power and deterrence. This is an old fashioned concept evolved during the Cold War which has become the *mantra*. Many countries have wisely realised the enormous penalty the possession of these weapons imposes on their economies. South Africa, Brazil, Argentina – all of whom had attained the same levels of technological competence as India in the nuclear field – decided to give up their capabilities. If any one had a good reason to cock a snook at the western alliance and insist on retaining the bomb, it was Nelson Mandela. The wise man knew that issues concerning the development of his people were far more important than possessing the bomb with all its attendant implications.

Let us quickly demolish the 'status' and 'power' theory. Germany and Japan are probably the strongest economies and whose people enjoy a quality of life which is the envy of others. Surely they are powerful nations with a voice which is heard everywhere. Both have done well without the nuke. Japan will, in all probability, join as the next permanent member of the Security Council – a seat we have coveted for a long time. After 11 May we have certainly botched whatever little chance we might have had in this regard. As it is for individuals so it is for nations. Respect has to be earned and cannot be demanded! There goes overboard the theory of status and power. How can we stand

tall and feel proud when even after 50 years of independence we have over 500 million fellow Indians who still live below the poverty line.

We figure as 138 out of 175 nations in the overall rankings in the UNDP's Human Development Report of 1997. Many nations in Asia and Africa figure way above us on this list. To be able to call ourselves the world's number six, we need much more than just nuclear bombs.

Now to address the deterrence theory. We are all aware of the awesome effects of a nuclear war. Not only do we hazard ourselves but the rest of the world too. Weapon capacities, effectiveness and destructive power have grown manifold since Hiroshima and Nagasaki and it is clear that there can be no winners in a nuclear war.

**T**he chances, therefore, are that we will incur all this expense for the development of these weapons only to store them in a 'deep freeze'. What a waste! As a rule, more and more expenses are forced on nuclear adversaries due to an arms race which is inevitable, for the 'military psyche' demands to be one up over his adversary at all times. This is true of conventional weapons and even more so in the nuclear weapons business. The price we will have to pay is enormous. To illustrate this point, the price we paid for each Sukhoi aircraft recently acquired from the Soviet Union was about Rs 175 crore! The project cost Rs 7500 crore. That kind of money is adequate to give drinking water to over 300,000 villages, or build 150,000 primary schools or an equal number of primary health care centres.

Let us take the scenario of nuclear blackmail. Assuming that there was an asymmetrical nuclear equation between us and Pakistan, or

China, did we really believe that these nations would have deployed a few nuclear bombs to settle either the Kashmir issue or the Arunachal border dispute, and not expose themselves in the bargain to radiation and other ill-effects of a nuclear strike? Surely, we have lived through this asymmetry vis-a-vis China since 1964, and with all the other nuclear haves for a much longer duration. We demonstrated our technical ability to explode a nuclear device in 1974. Given this wonderful situation, what then was all this hurry for in May 1998?

**T**here is really a no win situation with or without nuclear weapons for either side. None of our contentious issues is likely to be settled militarily; so what has Pokhran II given us that we did not already have? We might as well have settled for the cheaper option of first organizing our own affairs.

Does this government really believe that with Pokhran II we have deterred the USA which has nuclear submarines armed with deadly weapons deployed in the Indian Ocean, who can if they so desire strike the sub-continent at any time and place of their choosing? They have over ten thousand nuclear weapons – vulgar, yes – but whom are we competing against? We must also be realistic. There is no doubt that the demands made by the P5 states to have exclusive rights to nukes is untenable, but then whatever moral clout we had before 11 May to rein them in has now been lost for good. There was no other means to pressurise the nuclear haves except the moral and ethical; this we have now shed from our inventory.

Much before Pokhran II it was well known to those in power that the border disputes, including the Kashmir question with Pakistan and our boundary question with China,

could not be resolved militarily. With nukes now, it is even more difficult and disastrous to attempt any military adventurism. Common sense tells us that these issues can and must only be resolved by negotiations and evolving a political settlement. Even if Pakistan acts shy, we must take the initiative to demonstrate a statesmanlike, pragmatic and positive approach to discuss these issues and not fuss about dates and venues as we have done hitherto. We must also try to bring some fresh thinking on the subject of Kashmir.

The gamble of 'Shakti' on Buddha Purnima day in May by the BJP-led government has indeed boomeranged. If anything, there has been a considerable deterioration in the overall security environment. The country has now been exposed to a potential nuclear holocaust which could happen due to a misadventure like 'winning a war in 90 minutes' or an accident. The Indian people will have to pay many a penalty – in terms of economic sanctions, reduced outlays in the socio-economic sector, added burden on defence and the challenges of an angry and hostile international community.

**W**e have made a big mistake and landed ourselves in a mess. We must quickly get out of this quagmire by initiating a dialogue with both Pakistan and China, and to resolve outstanding issues peacefully. Most importantly, both India and Pakistan must cap all their nuclear weapon related activities and come to the table. With China, we need to restore the good relations that we had prior to the tests.

Clearly, the way ahead is through dialogue and discussion, not confrontation and conflict. This is the least we owe to our peoples in the sub continent. The alternative is to go down in history as the ones who brought on *Kaliyug* prematurely!

# Do nuclear weapons provide security?

M. V. RAMANA

HAVING a gun pointed at you is an unnerving experience, even if you have a gun pointing at the other person. With the recent tests, India and Pakistan are in a similar situation. They are now certainly targets for the nuclear missiles of all the other nuclear weapon states, as well as each other. This may or may not have been true earlier, but one can be sure it is the case now. It is, of course, not just the populace of India and Pakistan who inhabit the bull's eye. Despite having thousands of missiles, people in the US and Russia have lived in the constant fear that Washington, Moscow, or their own city could be destroyed in a moment. Knowledge that they are being targeted cannot provide security, only insecurity, to the people of the US and Russia, as well as India and Pakistan.

What then is the security rationale for building nuclear weapons? The usual justification offered is that nuclear weapons are needed to deter the use or threat of use of nuclear weapons by another country. Underlying the concept of deterrence is the idea of Mutually Assured Destruction – that any use of nuclear weapons by two countries possessing large nuclear arsenals would lead to massive destruction in both countries.<sup>1</sup> The idea of deterrence is that faced with this prospect of destruction, no country would initiate war. This notion of nuclear deterrence, by being articulated often enough, seems to

---

1. Mutually Assured Destruction, like much of the language that is used in discussing nuclear weapons, camouflages what is being talked about. Even official policy-makers occasionally admit this. For example, Fred C.

have become accepted as true. Deterrence, however, is not a law of nature like the theory of relativity. Underlying it are various assumptions, any of which may turn out to be false at any given point in time. And, the result of any failure could be catastrophic.

**T**he most basic assumption is that states are unitary, rational decision-makers trying to maximize their expected utility.<sup>2</sup> In reality, of course, this is far from true. Nevertheless, international relations scholars often assume this because it makes it easier to make predictions. Both the assumptions of unitary actors and rationality become particularly problematic during periods of crisis, especially war. Then, the multiplicity of individuals, institutions and interests that shape decision making become crucial and could lead to outcomes that would be termed irrational.<sup>3</sup>

Irrational behaviour could also manifest itself at the individual level. An example of this was Richard Nixon who, under the strains of his final days in the presidency, is said to have sobbed, beaten his fists on the floor of his office, and to have mused about his ability to release the forces of nuclear disaster. The (then) Defense Secretary, Schlesinger, took special precautions to prevent any of

his orders to nuclear forces from being carried out.<sup>4</sup> Had there been an international crisis during that period, there is no way of knowing how Nixon would have acted. The use of nuclear weapons by Nixon, or by any other leader at any other time, would have meant the death of deterrence – and millions of people.

The counterparts of Nixon in South Asia could be Vajpayee or George Fernandes or Mulayam Singh Yadav or Nawaz Sharif or Gohar Ayub Khan. The question to think about is if anyone would, or should, feel secure with the knowledge that these people have the lives of millions of people in South Asia at their mercy. Nuclear war could result from a wrong judgement either on their part or by genuine mistakes.

**D**espite these unwarranted assumptions as the main piece of evidence for trusting their arguments, believers in nuclear deterrence offer us the fact that the US and the Soviet Union did not go to (major) war against each other during the Cold War. Political scientists and historians have long contested the suggested explanation that it was nuclear weapons which kept the peace. Many, even believers in deterrence, would point to a range of factors that aided stability: the legacy of World War II, bipolarity, economic independence rather than interdependence, and so on.<sup>5</sup> It has even been argued that 'while nuclear weapons may have substantially influenced political rhetoric, public discourse, and defence

budgets and planning, it is not at all clear that they have had a significant impact on the history of world affairs since World War II.'<sup>6</sup> Thus, evidence for deterrence is weak, at best. Further, the absence of war so far does not imply that the same would hold true during other circumstances and for all time.

**O**ver and above these arguments for why deterrence may not be based on well-founded assumptions, it is worth noting that a growing number of military officials with concrete experience of working with nuclear weapons have questioned the logic of deterrence. Commander Robert Green, a retired British naval officer, calls nuclear deterrence 'a dangerous illusion.'<sup>7</sup> According to General Lee Butler, who headed the US Strategic Air Command, the world 'survived the Cuban missile crisis no thanks to deterrence, but only by the grace of God.'<sup>8</sup>

Thus, to reiterate, deterrence is based on faulty assumptions and may break down, especially in crises. For example, a single rash act, or even rumours of a planned attack by the adversary, may trigger off nuclear war. If that happens, the massive destructive power available to both sides, intended precisely to strengthen deterrence, would ensure large-scale death and destruction.

For the present, let us grant the votaries of deterrence their security blankets and see what else needs to be

Ikle, who went on to be the US Undersecretary of Defense during the Reagan administration, says, 'Assured Destruction fails to indicate what is to be destroyed; but then "assured genocide" would reveal the truth too starkly. Keeping ready arsenals for instant and unrestrained slaughter of men, women and children is likely to impose a wrenching perspective on the officialdom of both nations.' See, Fred. C. Ikle, 'Can Nuclear Deterrence Last Out the Century', *Foreign Affairs* 51, 1973.

in place for nuclear arsenals to even pretend to offer security.

Having a large nuclear arsenal alone does not seem to be sufficient for deterrence. The US and Russia live in perpetual fear that the other may launch a first strike and hence have put into place early warning systems. Multiple satellites monitor the whole world looking for signals of missile launches. Once detected, there are early warning radars that would take over, follow missile trajectories, and pass on the data to processing centres. From thereon, there are communication systems that attempt to ensure that information is conveyed to decision-makers that are more senior.

**T**hese satellites and early warning radar systems give them information within one and a half minutes of the possible launch of a missile. The analysis of this data takes about two and a half minutes. During the next few minutes, decision-makers could discuss the likelihood of the attack being real. If no other explanations could be found for the signals, the President would be notified and he could call the other side to check if there had been an accidental launch of the missiles. All this is possible because missiles take about 25 minutes to travel from one country to the other. Further, this also allows various fail-safe measures to be built into the system as a hedge against miscalculation. The system, thus, provides for many layers of evaluation of accuracy of signals and decision-making.

Despite the enormous financial and technical resources invested in setting up and running these early warning systems and trying to make them fool-proof, these systems frequently failed. Information on these failures is largely kept secret. It is known, however, that between 1977 and 1984 the US early warning system

showed over 20,000 false alarms of a missile attack. Over 1000 of these were considered serious enough for bombers and missiles to be placed on alert.<sup>9</sup>

**T**here were similar scares on the Russian side as well; a recent example is worth recounting. On 25 January 1995, military technicians at several radar stations across northern Russia thought they had seen a single missile from a US submarine coming towards Russia. This information was passed on through the chains of command to President Yeltsin who activated the 'nuclear briefcase', thus putting Russian forces on high alert. Subsequently, after about eight minutes, senior military officers determined that the rocket was headed far out to sea. The rocket turned out to be an American scientific probe to study the northern lights.<sup>10</sup>

In the case of South Asia, even if such systems could be set up at enormous financial costs that we can scarcely afford, they would just not suffice. Both India and Pakistan are adjoining nations with a long border. Missile and airplane flight times are very short. A Prithvi missile would take three to five minutes to reach almost anywhere in Pakistan. A Ghauri missile would take about five minutes to reach Delhi. Where, then, is the time for analysis of signals from satellites and radars, or to discuss the threat? How can leaders on both sides talk and check if the launch was accidental or intentional?

9. H.L. Abrams, 'Strategic Defense and Inadvertent Nuclear War', in *Inadvertent Nuclear War: The Implications of the Changing Global Order* edited by H. Wiberg, I.D. Petersen and P. Smoker. Pergamon Press, Oxford, 1993, pp. 39-55.

10. Bruce G. Blair, Harold A. Feiveson and Frank von Hippel, 'Taking Nuclear Weapons off Hair-Trigger Alert', *Scientific American*, November 1997.

Because of this short warning time, both nations are likely to adopt a policy of launching their missiles as soon as there is a likelihood of the adversary launching an attack, or risk the prospect of losing their missiles on the ground. In light of the multiple possibilities for false alarms, this policy would almost ensure that nuclear weapons are used, eventually. If missiles like Prithvi and Ghauri are loaded with nuclear warheads and deployed on hair-trigger alert, the people of India and Pakistan are doomed to living in constant insecurity.

**E**ven if one were to believe in deterrence, nuclear weapons pose conflicting demands. On the one hand, they have to be dispersed and in the hands of the military so that they can be used as soon as there is warning of an attack by the adversary. On the other hand, the decision to use these weapons is so momentous that one would like only the highest levels to authorize their use, that too after due deliberation. A third dimension is added by the widespread, large-scale effects of nuclear war – these could disrupt communication systems that allow leaders or commanders to communicate with field personnel.

Command and control systems are systems put in place to minimize the chances of inadvertent or unauthorized use of nuclear weapons. This is an arrangement of facilities, personnel, procedures and means of information acquisition, processing, and dissemination used by a commander in planning, directing, and controlling military operations.<sup>11</sup>

Most discussions of command and control emphasize the technical measures, implying in the process that if the technology is available then one

11. Paul Bracken, *The Command and Control of Nuclear Forces*. Yale University Press, New Haven, 1983, p. 3.

can feel secure. However, even the most sophisticated technical devices could be rendered worthless if improperly implemented.<sup>12</sup> For instance, one popular device to block unauthorized detonations is called Permissive Action Links (PALs). It is possible to imagine a PAL-code arrangement in which, due to concern about possible breakdown of communication with the field commander, higher authorities allow local access of the code. In such a case, regardless of how sophisticated the PAL hardware may be, unauthorized launch is possible.

**E**ven the most advanced command and control systems are not foolproof. One only has to see Hollywood movies, starting with the classic *Dr. Strangelove*, to visualize possible scenarios under which unauthorized attacks could take place. Here, as in other realms, truth could indeed be stranger than fiction.

Given the novelty of the situation, despite assurances by the prime ministers of India and Pakistan, it is highly unlikely that any foolproof command and control system would have been worked out. Indeed, Prime Minister Vajpayee said that India does not intend to replicate the kind of command and control structures possessed by other nuclear weapon states.<sup>13</sup> Thus, at the current moment, once weapons are assembled and handed over to the military, there is always a constant fear that some military official, for whatever reasons, may decide to launch an attack against the 'enemy'. The way to avoid such issues is simply not to assemble nuclear weapons. Some advocates of nuclear deterrence

in India even recommend keeping nuclear weapons dismantled and their components stored separately.<sup>14</sup>

**S**etting up these early warning systems and command and control mechanisms do not preclude the possibilities of accidents involving nuclear weapons. Despite safety and security measures, such accidents continue to occur around the world. Between 1950 and 1990, just the United States had over 175 accidents involving either nuclear weapons or vehicles that are suspected to have been carrying nuclear weapons.<sup>15</sup>

The greatest danger, which has fortunately never happened, would come from the accidental full-scale detonation of a nuclear weapon. However, there have been numerous accidents in which the chemical explosive surrounding the radioactive core of a nuclear weapon has exploded. For example, on 17 January 1966, a B-52 bomber and a KC-135 refueling tanker collided in mid-air near Palomares, Spain. The B-52 crashed and four hydrogen bombs (15-25 megatons) were separated from the plane. The chemical explosives in two of the bombs exploded leading to release of radioactive material in the middle of a populated area. A similar accident near any of the densely populated South Asian cities could make Bhopal look pale in comparison.<sup>16</sup>

If the number of accidents involving nuclear weapons seems high, the number of accidents (or incidents, as they are referred to by officials) in

nuclear reactors would be even more. Many, of course, are in reactors used primarily to produce energy. Most of them do not lead to any large-scale consequences. The main people at risk are the workers in these facilities. But, as the Chernobyl accident showed, when nuclear reactors have a major accident, then huge regions are at risk. For example, even in Connecticut, USA, there was a 26% increase in thyroid cancers due to radiation from Chernobyl.<sup>17</sup> While the Chernobyl reactor was primarily intended for the production of nuclear energy, even accidents at reactors that produce plutonium for nuclear weapons, which are typically smaller and somewhat different in the details of construction and operation, would lead to qualitatively similar consequences.

**E**ven under normal conditions facilities involved in manufacturing nuclear weapons – which include uranium mines, fuel element manufacturing plants, nuclear reactors, reprocessing centres and spent fuel storage sites<sup>18</sup> – cause radiation related diseases to people living in their vicinity.<sup>19</sup> Further, nuclear weapons, as we have seen recently, have to be tested.

15. Shaun Gregory, *The Hidden Costs of Deterrence: Nuclear Weapons Accidents*. Brassey's, London, 1990.

16. It has been estimated that dispersal of kilogram quantities of plutonium (used in nuclear weapons) could cause a few thousand deaths due to cancer. See Steve Fetter and

It is estimated that nuclear testing the world over would lead to over 430,000 cancer fatalities.<sup>20</sup> So far, these victims of nuclear weapons manufacture and testing have been the main casualties of nuclear weapons since Hiroshima and Nagasaki. Except under the narrowest definitions of security, the nuclear weapons complex would certainly count as a source of insecurity, especially to communities living near any of these facilities.

**N**uclear weapons also pose non-nuclear threats. For nearly the whole period of the 'long peace', the US and the Soviet Union were engaged in a series of proxy wars of which Korea, Vietnam and Afghanistan are just the most prominent examples. Nuclear weapons, by seemingly protecting their homelands, allowed these wars to be fought.<sup>21</sup> It is no wonder then that violence and militarism in Kashmir became intensified around the period when Pakistan started claiming and feeling confident about its nuclear capability in the late 1980s.

Despite claims that the establishment of nuclear capability in South Asia would freeze the Kashmir conflict, recent acts of terrorism in the Valley have demonstrated that nuclear tests have not changed the situation. The security of the people of Kashmir, as well as people living in other arenas of covert warfare between India and Pakistan, are certainly not enhanced by the bomb-making capabilities of the two countries. Fur-

ther, there is also the risk that even a small battle could escalate into nuclear war.

**I**n summing up, we see that nuclear weapons lead to different kinds of insecurity. Some like those from proxy wars or from accidents in facilities involved in producing nuclear weapon components do not even involve nuclear weapons in any way. But the great danger comes from the possibility of a nuclear explosion, by mistake or otherwise.

It is worth emphasizing what this could lead to. If a small nuclear weapon with the same yield (15 kilotons) as the one that was dropped on Hiroshima more than 50 years ago were exploded over Mumbai or Karachi, the number of immediate deaths could be as high as half a million.<sup>22</sup> This does not include the deaths that would arise from cancers and other diseases that result from the long-term effects of radiation. Further, in case of such an attack, it is not just those who are in Mumbai or Karachi at the time of the explosion who are affected. Radioactive fallout could spread across large regions due to wind and radiation levels will remain high for a long period. Thus, the range of the destruction extends across space and time. India and Pakistan now have to come to terms with Robert Jay Lifton's statement: 'The central existential fact of the nuclear age is vulnerability.'<sup>23</sup>

The way out of this predicament is to work for the abolition of nuclear weapons – both locally and globally.

# Distortion of scientific tradition

AMULYA K.N. REDDY

THE nuclear tests of 11 and 13 May created major turbulence in India, the sub-continent and the world. In the process, strange events were observed. For instance, a phalanx of directors of CSIR laboratories gave a standing ovation to the minister of science when he announced India's successful nuclear tests. The prime minister added *jai vigyan* to the *jai jawan* slogan so that scientists could join soldiers in the march to battle. Even more telling was a photograph of India's leading nuclear scientists in military camouflage uniforms at Pokhran. Indian science was foregrounded as a major determinant of the present and future. Suddenly, the external linkages of Indian science and its internal condition have become central issues for scrutiny and assessment.

This issue of *Seminar* is an excellent occasion for such a discussion. In this paper the focus will be on the way the nuclear tests have exposed the relationship between Indian science, on the one hand, and Indian society, its state, humanistic tradition, morality and scientific community on the other.

Such an analysis is overdue because an excellent opportunity for a critical assessment of Indian science was missed in 1997. Last year's celebrations of the 50th anniversary of Indian independence provoked a large number of articles in various newspapers, magazines and journals on politics, economics, industry, agriculture, infrastructure and so on. Many of the discussions were scholarly, insightful,

enlightening and of archival value. In striking contrast were the articles on science in independent India, which ended up as pedestrian diaries of the growth of post-1947 Indian science. They were lavish in their praise of its 'achievements' but almost completely lacking in criticism and analysis. There was, for instance, no attempt at a SWOT or strengths-weaknesses-opportunities-threats analysis. There was no discussion of the external linkages of Indian science to our state and to society. There was also no treatment of the internal health and functioning of scientific organisations and of the scientific community. And after the anniversary, non introspective normalcy and self-satisfied smugness soon returned.

Discussions on Indian science must start with the country's poverty, for this is its defining characteristic and fundamental reality. In 1951, India's poor numbered 164 million; in 1993-94, the number had increased to 312 million, that is, double the number of people who could not meet their daily subsistence requirements at independence. Between 1950-51 and 1993-94, the population below the poverty line declined by less than one per cent per year. One in three Indians go to bed hungry. Life expectancy is about 60. Half the Indian population cannot read or write. The Human Poverty Index (HPI) is about 37% — this index is a composite of *longevity* (19.4% of the population expected to die before the age of 40), *knowledge* (48.8% are illiterate), and *standard of*

living (19% are without access to safe drinking water, 15% without access to health services and 53% of the children are malnourished/underweight). India belongs well and truly to the club of poorest nations. The country can move out of this cursed club only through sustainable development.

It is this Indian reality that must guide the direction of Indian science. Instead, what is observed is a lack of correspondence between the thrust of Indian science and the problems of the Indian people. According to the expenditures on R&D, it appears that the bulk of the expenditure (about two-thirds<sup>1</sup>) goes to the Defence Research and Development Organisation, Department of Space and Department of Atomic Energy, all of which have overt and/or covert military implications. Of the balance, a large percentage goes to industrial research, but this caters largely to the needs of the elite. In fact, going by the militarist-elitist expenditure pattern of Indian R&D, one would think that the primary problems of Indian society concern external security and upper class consumption wants, rather than poor health, illiteracy and basic needs.

**T**his mis-orientation of Indian science is not a surprise. It follows from the fact that the country consists of small islands of urban splendour amidst vast oceans of rural misery. This situation is often referred to as a 'dual society' – a small politically powerful elite (constituting a mere 10-15% of the population and consisting

of industrialists, landlords, bureaucrats, professionals and white-collar labour) living in conspicuous affluence amidst the abject poverty of the politically weak masses.

**F**ree India started with the Nehruvian idea of science as an essential accoutrement of a modern society. Today, the nuclear tests have shown the determination of the rulers to make Indian science a servant of the state and its internal and external political ambitions. The jai vigyan pronouncement symbolises this attempt by the government to co-opt scientists, subverting the idea that science is the people's *astra* (weapon) against poverty.

But, this government's move is not an unrequited one-sided desire to embrace. In turn, scientists have been wooing the ruling establishment with a desperate desire to be in the corridors of power. When the government kept them at an arm's length – as seems to have been the case in the Narasimha Rao regime – scientists felt embittered and rejected. They even considered that period as the nadir of post Independence Indian science.

In contrast, the giants of Indian science, in particular C. V. Raman and Meghnad Saha, considered their independence from government in the years immediately after 1947 to be a matter of pride. But, power was irresistible to the lesser scientists who followed. And the only way this desire could be fulfilled was to woo the government through its scientific ministries and their secretaries. Scientific academies courted secretaries of scientific ministries to be their presidents and office-bearers. There was no regret that, in the process, the academies lost their independence. Or, that their voices could not be distinguished from those of the government. This in a country where there are few other institutions that are independent enough

to come up with perspectives different from the government. In the West, the universities provide independent policy studies, but such independence is rare in India.

Thus, scientists wanted to be, and became, a pressure group. All this has become clear after the tests when a former prime minister revealed how the nuclear scientists lobbied the government to give them a chance to prove their capability. The scientists had not done a comprehensive cost-benefit analysis of the tests and their fall-out. They did not reveal a national perspective. If anything, they pursued a narrow departmental, if not personal, agenda, perhaps emulating their political masters.

**A**re the tests a great achievement of Indian science? Yes, only if one has an inferiority complex and has doubts about whether Indian scientists are as good as their western counterparts. There is no need for such inferiority. It was always known that, given a clear mission and the necessary resources, Indian science can reach the highest levels of achievement. Any residual doubts can be set at rest by noting that the best universities, institutes and industries of the US are filled with scientists of Indian origin. Indians are as good as the best. The tests have only confirmed this truth. There was no need for euphoria after the tests.

Of course, it is difficult under Indian conditions to deliver a product as distinct from an idea or concept. This has been done. To that extent, the tests are an achievement. Also, it is widely believed that Indians have serious problems in working together. The bomb squad has worked as a team. This is another achievement. But, we must take into account the large number (thousands) of scientists in DAE, the enormous amount of money spent over the years (thousands of

1. The Union Budget, Expenditure Budget, Volume II gives 59% for Defence R&D, DAE and DOS, and the Stockholm International Peace Research Institute website <http://www.sipri.se> has an article 'Nuclear deterrence, nuclear tests and science in South Asia: selected statistics and quotes' compiled by Eric Arnett which states that the 'percentage of government funding for science spent on military, nuclear and space R&D' was 68% in FY 1996-97.'

crores) and the decades of time (20 years for Pokhran I and 24 years for Pokhran II).

Further, a great deal of information is available on the Web and in the public domain. Even the Teller-Ulam configuration of the hydrogen bomb has been described. In any case, we must not forget that the fission bomb is a 53 year old technology, and the fusion bomb is a 46 year old technology. So, we have replicated half a century old achievements. And, as Pakistan has demonstrated, 'What one Abdul (Kalam) can do, another Abdul (Quader Khan) can!'

Indian science cannot escape the fact that it is operating in the land of Gandhi. He said: 'Recall the face of the poorest and most helpless person whom you have seen and ask yourself if the step you contemplate is going to be of any use to him. Will he be able to gain anything by it? Will it restore him to control over his life and destiny?' Quite clearly, this Gandhi talisman was ignored in the entire process of preparing for and carrying out the nuclear tests. If the heritage of Gandhi was denied by Indian science, an even greater sacrilege was committed by using the code: 'The Buddha has smiled!' to convey to Indira Gandhi the message that Pokhran I had been a success. This sully of the memory of Buddha was compounded by choosing Buddha Jayanti to set off the recent explosions.

The roots of this disjunction between Indian science and morality go much deeper. Modern science has been based on two dichotomies: (a) separation of the subject from the object and (b) separation of feelings and emotion (the non-cognitive self) from thought and analysis (the cognitive self). Accordingly, a scientist's first duty is to separate himself/herself from the object under study, and the

second duty is to eschew feelings from the analysis. Thereby, science claims objectivity. However, the first dichotomy leads inevitably to degradation of the objects of study (even humans) into things, and the second, to the removal of feelings for objects (plants, animals and finally human beings of different castes, tribes, nationalities and religions).

All this leads to the conventional view that science is amoral and neutral. We must not forget that Oppenheimer said that the first atomic bomb was 'technically sweet'. Or that, at the 1988 Bangalore national workshop on 'nuclear plants with specific reference to Kaiga', a Department of Atomic Energy scientist said: 'Hiroshima provided us with a fortunate opportunity to study radiation effects!' The claim of amorality is a clever way of escaping responsibility for the horrors that have sprung from science, for instance, for the Hiroshima bomb after computing and prescribing the height at which the bomb must be exploded to maximise the number of people who would die.

This neutrality of science is also implicit in Kalam's repeated statement that 'he is only an engineer' and that 'his missile can also be used for delivering flowers.' But, the youth of the 1960s in Europe and North America rejected such sophistry. As did the post-World War II judgements at Nuremberg which ruled that the Nazis charged with war crimes (like all human beings, even soldiers) cannot claim immunity on the grounds that they carried out orders; they have to bear full responsibility for the consequences of their actions.

The relationship between the subject (the scientist) and the system under scientific study (the object) must be dialectical so that initial separation (and distance) ends in subse-

quent unification (and embrace). The suppression of emotion *during* analysis must give way to emotion *after* analysis. The functioning of scientists as individuals, groups and institutions must be constrained and limited by moral strictures and bans. Otherwise, the synergy between the isolation of the subject from the object and the removal or absence of emotions and feelings leads inevitably to science becoming the instrument of violence, oppression and evil. Science, therefore, is not neutral and amoral. It can and must be encoded with *life affirming* values.

From this standpoint, there are no life-affirming values associated with the nuclear tests and the attitude of the government to weaponisation. In fact, if there are any values at all, they are life-destroying. And the prime minister's jai vigyan pronouncement is tantamount to eulogising activities of science that can end up killing millions of non-combatants – children, women and men – in a nuclear attack. There is a pernicious value system underlying all this jai vigyan stuff which is only a ploy of the rulers to win over scientists to the militarization of Indian science. By going euphoric over science as an instrument of mega-death, the government is sending a message commending the nexus between science and evil. The link between science and morality must be re-established.

The nuclear tests also exposed the internal condition of Indian science. Faced with a complexity of issues raised by the tests – issues of (internal and external) security, trade and economics, politics, ethics, national traditions – it would have been natural for our body of intelligent and creative scientists to develop a spectrum of views. Instead, the virtually unanimous euphoria was astonishing. And,

the silence of the present and past leaders of science its journals and its academies – was deafening. Since it is statistically unlikely that almost the entire body of scientists had independently arrived at a single view, one has to probe deeper to find an explanation.

The vitality of science in a society depends upon the challenges thrown up by the innovation chain leading to technology as well as upon its internal momentum arising from the backlog of unresolved problems. An understanding of science-society interactions in India has to take into account, on the one hand, the existence of a dual society and, on the other, its strong interaction with the industrialised countries. The coupling with the industrialised countries leads to the dominance of foreign collaborating industry based on the import of western technology, and the dual character of Indian society results in an overwhelmingly elitist thrust of indigenous technology. Further, even these indigenous technological efforts consist almost wholly of the imitation and adaptation of western technology, rather than of innovation.

**T**his near complete decoupling of science and technology from each other has a profound impact on science in India and produces its first major abnormality. Because of the preponderance of technology imports and of the imitative character of indigenous technology, the initial part of the innovation chain (consisting of research, design and development, and engineering for manufacturing) hardly exists in the country. As a result, its scientific system is not subject to the pressure of basic problems emerging from technology. And, without this pressure from technology, indigenous science is deprived of a powerful driving force. If Indian

science is to flourish, it must depend solely upon its internal momentum which is the product of the 'mass' of scientists and the 'velocity' or pace of scientific research.

**T**he pace or tempo of research activity depends upon the existence and maintenance of an atmosphere of excitement which in turn requires a conviction of being 'hot on the trail' of important discoveries. Such an atmosphere is facilitated by rapid communication between scientists through personal contacts, seminars, symposia and conferences and through well-referred journals which ensure quick publication. The pace of research is usually set by outstanding scientists who attract a following. The point is that scientists tend 'to hunt in packs' behind leaders.

The mass of scientists depends upon the size of the scientific body, but not merely upon the number of scientists. What is required is a *community* of *interacting* scientists with the well-established traditions of a peer system. Scientific peers are crucial for discussions, brain-storming and testing out ideas, for acquiring different ways of looking at a problem, for enhancing the quality of seminars, symposia and conferences, for rigorous assessment and constructive criticism of work, for help in improving its quality, for weeding out defective work, for a process of recognition that is appreciated, and so on. In short, without the environment of an actively interacting scientific community, there cannot be the natural selection of scientific ideas and data which alone will ensure that the fittest theories and experiments survive.

Natural selection of ideas implies competition and diversity. It cannot arise if there is a monoculture of views. Truth cannot emerge if there is an absence and/or exclusion of dis-

sent,<sup>2</sup> and certainly not if dissenters are branded anti-scientific and anti-national. It is against this background that one notes that there are no major scientific controversies within the Indian scientific establishment. Bitter enmities between some leaders of Indian science are well known, but they are only due to conflicts of ambitions and careers; they are not on scientific issues. The only controversies that have arisen – the Bhopal gas leak, the Sardar Sarovar project, nuclear power – have arisen from scientists who are outside the establishment or are treated as renegades and ignored.

**T**he standard way of avoiding genuine controversy and peer review is to exclude unorthodox views from seminars, committees, journals and other forums (including the peer-reviewing process). So, one finds internationally acclaimed experts not being invited to meetings on their subject because they hold 'unacceptable' views or they are not part of the hierarchy. The dialectic of truth is frustrated even in so-called institutes of 'advanced' studies. Of course, this distortion of scientific tradition cannot survive with transparent and democratic functioning. That is why there is a striking lack of transparency, undemocratic functioning and manipulation of peer review.

Underlying all this violation of the scientific tradition and its codes of behaviour is the fact that 'he who pays the piper calls the tune.' Government and quasi-government sources are responsible for the overwhelming

2. Appreciation of the importance of dissent can be found in most unexpected quarters. *The Hindu* of 5 July 1998 (p. 7) carries a report that the CIA has an officer in charge of 'contrarian thinking' whose failure 'to challenge the experts of the agency and other intelligence agencies' was the 'key incident' contributing to the 'worst intelligence failure' in recent times of the US not predicting the Indian nuclear tests.

share of science funding so that scientific activity depends strongly on this funding, and almost all scientists are on the government pay-roll or perk-roll. There are also a number of cash prizes and awards which act as further inducements to conform, rather than dissent. No wonder there was a stampede of scientists to applaud the nuclear tests and prove their patriotism as perceived by the establishment. Fortunately, despite this pressure for conformity, there were scientists who dissented and their numbers have grown with the waning of the euphoria.

**T**he nuclear tests and threat of weaponisation have exposed serious weaknesses in Indian science. They have shown that Indian science is responding more to the militaristic and consumption ambitions of the elite than to the problems of the poverty-stricken Indian masses. Rather than be a force that balances the demands of the state and civil society, the tests have revealed that Indian science has become a servant of the state whilst pressuring it to advance the vested interests of Indian science and its scientists. The tests have revealed that the science-state nexus is strong.

Indian science has betrayed the humanistic heritage left behind by Mahatma Gandhi and Lord Buddha. Sheltering behind the argument that science is amoral and neutral, Indian science may become an instrument of violence, oppression and evil. It has not encoded itself with life-affirming values. Immediately after the nuclear tests, the majority of Indian scientists echoed the official line in a regimented fashion. They did not show the independence of perspective and diversity of views characteristic of a community of interacting scientists with the well-established traditions of science.

Is there hope for Indian science? Yes, and it is to be found in the movements of dissent that emerged from many scientific institutions after the nuclear tests.<sup>3</sup> If these 'nuclei' grow and coalesce, then there is hope for a 'phase transformation' through which the character of Indian science will change. Then, the poor and the meek shall inherit Indian science. The state will be enriched by having a significant fraction of scientists reflecting independent views through the institutions of civil society. The morality of Indian science will become a tribute to the legacy of Gandhi and Buddha.

Now that the tests are over, Indian scientists must move forward. They must stop (a) the jingoistic exploitation of the event by forces with short-term political interests, (b) the erosion of democracy, (c) the further diversion of scientific talent away from the problems of the poor towards military applications of science and (d) an arms race with our neighbours. They must contribute to the process of international disarmament. And above all, they must turn their attention to the historic mission of giving all Indians – particularly the underprivileged – a better life at least in the next century.

**T**hey have several roles as intelligent people privileged with technical training:

1. They must spread awareness of the enormous consequences of the path the government may choose from the nuclear option to tested weapons to deployed weapons to weapons on hair-trigger alert. For example, the effects of one primitive Hiroshima-type bomb on Bangalore or Chennai or Calcutta or Delhi or Mumbai must

3. See the website <http://www.geocities.com/CapitolHill/2959> of *Indian Scientists on the Nuclear Tests*.

be estimated and publicised. Independent calculations must be made of the financial costs of the ruinous path the country is being urged to choose.

2. They must build an independent peer group outside the establishment to verify the claims being made. Secrecy stifles independence, erodes excellence and breeds mistakes (and even lies!). For example, independent estimates of the costs of nuclear power have already revealed serious flaws in DAE's costing. No wonder that secrecy is an important weapon used by insecure establishments to prevent rigorous peer review.

3. They must reorient the thrust of Indian S&T. Unfortunately, this demand leads to the spotlight being turned on fundamental research which is asked to justify its usefulness. But, fundamental research accounts for less than 10-15% of the total expenditure. This share should be given – no questions asked – to the fundamental scientists. In return, all that must be insisted upon is that they set up and implement rigorous quality control measures and strive for excellence. The real accused is applied research and technology which consumes the bulk of the R&D funds. It must be carefully ensured that its thrust corresponds to the country's problems.<sup>4</sup> In the process it must not be forgotten that India is a dual society with a powerful elite and disempowered masses.

4. Scientists must be involved in new coalitions of people against the militaristic turn in the affairs of the nation. They must join forces with peace activists, development workers, environmentalists, women, dalits – in fact, all those who are concerned about the future

4. That this is possible even under present conditions was proved by several governmental and autonomous institutions as well as non-governmental organisations in the late 1970s and the 1980s which evolved innovative efforts and methodologies to re-unite science and the people.

# Indian science after Pokhran II

T. JAYARAMAN

THE political stock of Indian science and technology today appears to have reached an all-time high. Following Pokhran II, praise has been showered on Indian scientists and engineers by the nation's political leadership, the media and the public at large.

It would seem that even if India has not succeeded in bombing its way into the nuclear weapons club, Indian science and technology has certainly bombed its way into public favour. Even as parliamentary criticism has mounted against the motivation, wisdom and timing of the BJP-led government's decision to test, little criticism has been directed at the atomic energy and defence research establishments. The claims of high scientific achievement have been accepted without notable challenge, nor has there been any significant criticism of their political role in the abrupt and

adventurist reversal of India's established nuclear policy line.

In fact, it has been an integral part of the government's strategy to use the scientific argument, and the general public appreciation of Indian science and its successes, to justify its reactionary departure from India's established nuclear policy. Initiating the parliamentary debate on the nuclear issue, Prime Minister Vajpayee claimed that India's newly acquired nuclear weapons state status was 'an endowment given to her by scientists and engineers.'

The new upbeat attitude to Indian science and technology seems also to be a significant contributory factor to sustaining the conviction that economic sanctions could be weathered without much damage. Even the private sector, long known to have contributed virtually nothing to S&T research in

India and to prefer foreign collaborations to developing their own technological capabilities, has expressed support for indigenous capabilities in terms that have hardly been heard before.

This chorus of support for Indian S&T, and the apparent self-confidence projected by the atomic energy and defence research establishments following the nuclear tests, has created genuine confusion among sections of public opinion that would otherwise have reacted more sharply to the sudden reversal of the earlier nuclear policy. It is important therefore to examine, in some detail, what Pokhran II reveals about the state of Indian science and technology.

It is argued in what follows that contrary to the popular perception, Pokhran II has exposed serious weaknesses in the fabric of Indian science and technology. The political attitudes of the atomic energy and defence research community after Pokhran II betray a backward understanding of science and its role in society. The attempt of the leadership in these sectors to encourage and glorify the programme of nuclear weaponisation constitutes a challenge to the accepted political paradigm of Indian S&T that views science and technology as an integral tool in the task of development. Today, there is the genuine possibility of an unacceptable militarisation of sectors of Indian science and a serious distortion of the priorities that science and technology must necessarily have in a developing society.

If we cut through the official and media hype and go beyond the boastful claims of the atomic energy and defence research establishments, it is clear that the nuclear weapons tests have presented, unarguably, the most meaningful political and moral chal-

lenge to Indian science and technology in the post-independence period. It is a challenge to which the Indian scientific and technological community as a whole has been unable to respond in any serious fashion, exposing serious weaknesses in their development as a profession, in the broad sense of the term.

At the level of scientific credibility itself, the validity of two significant scientific claims made with regard to the nuclear weapons tests of May 1998 have not yet been adequately established. The first important claim is that one of the weapons tested on 11 May was actually a thermo-nuclear device; the second is that our nuclear weapons specialists have now the capability to undertake sub-critical testing.

The major suspicions about whether India actually has a thermo-nuclear weapon, voiced mainly in the foreign media, centre essentially around the low explosive power of the devices. In general, the data appears consistent, according to foreign experts (for an early example, see *The New York Times* article by William J. Broad, reproduced in *Frontline*, 19 June 1998) with a 'boosted' fission device. However, the DAE has chosen to aggressively counter the doubts with an explicit claim that it was indeed a genuine hydrogen bomb with two explosive stages, a 'secondary fusion device' with a 'fission trigger'. While it is possible that Indian scientists have leap-frogged directly from atomic weapons to low-yield thermo-nuclear devices, bypassing the intermediate stages of 'boosted' fission devices and megaton thermo-nuclear bombs, the situation has not been adequately clarified.

Conflicting signals have emerged from the scientific and political establishments after the first few days.

Peculiarly enough, while the DAE has been forceful in claiming a thermo-nuclear explosion, it has not really pressed a claim that it has, in fact, tested an advanced third-generation device. Strangest of all, the prime minister's *suo moto* statement of 27 May to Parliament is completely silent on the subject of a thermo-nuclear device having been developed. The paper submitted by him to Parliament on 'Evolution of India's nuclear policy' makes only a passing mention of the thermo-nuclear test, while acknowledging other scientific advances like the development of the capability of sub-critical testing.

The second claim, relating to the development of sub-critical testing capabilities, has also been challenged by a special correspondent in an important, technically detailed article in the 17 July 1998 issue of *Frontline*. The basic point is that five tests appear insufficient to justify the claim that henceforth sub-critical tests and computer simulations alone will be sufficient. This is particularly because the dynamics of the explosion in this range of power are extremely complex and appear to require many more sub-kiloton tests before the ability to successfully use sub-critical tests can be acquired. It is quite possible, the correspondent states, that more 'tests' would be subsequently needed in the pursuit of a weaponisation programme.

Apart from the validity of the specific claims made with regard to the nuclear tests, it is important to objectively assess what the claims of high achievement in these tests amount to in comparison with other technological challenges, both in the nuclear field and other sectors. Here an obvious point has been missed in the media and official hype surrounding Pokhran II. The maintaining of

controlled nuclear reactions under safe conditions, as is done in the several different kinds of reactors under operation in this country, is a far greater challenge than the development of nuclear weapons. A fast breeder reactor (of the kind now operational at the Indira Gandhi Centre for Advanced Research – IGCAR – Kalpakkam) is a far greater technical challenge than a nuclear weapon. One may pick other examples from other technological sectors. Several obvious examples are available from space research where the indigenous development of communication satellites and the work towards the development of a geo-stationary launch vehicle are two outstanding examples.

**N**uclear weapons technology, it must be made clear, is proven technology. The basic principles of its functioning and design are known and it has been established that these principles are correct. Fifty years later, it is a matter of getting the details straight; the problem is essentially one of engineering design. The Pokhran II tests may of course have involved new elements in this field or innovative ways to produce the fissile materials used, but none of these can be used to describe the tests as an 'extraordinary' achievement.

It is clear therefore that the celebration of the 'scientific achievements' of Pokhran II had more to do with jingoism and the feeling that India had broken into the club of nuclear weapons powers rather than any objective evaluation of the degree of scientific advance involved in conducting these tests. It is worth noting that much of nuclear weapons technology is secret in nature, and this contributes something extra to the feeling of triumph that accompanies the acquisition and mastery of such technology. In any case, the exagger-

ated claims of 'achievement' were sharply cut to size following the Chagai nuclear tests by Pakistan.

Turning to the political role of the atomic energy and defence research establishments, it is now increasingly clear that they played a pro-active role in building up pressure to conduct the tests. Former Prime Minister H.D. Deve Gowda, in his letter of 15 May 1998 addressed to Prime Minister Atal Behari Vajpayee (reproduced in *People's Democracy*, 24 May 1998), states clearly that it was the scientists who requested the tests during his tenure, just as they had done with his predecessor, P.V. Narasimha Rao, in 1995.

In a revealing press interview (published in the *Deccan Herald*, 4 March 1998), on the eve of the BJP coming to power, R. Chidambaram, Chairman of the Atomic Energy Commission, claimed that nuclear tests were a 'necessity'. Even while acknowledging that India's existing nuclear weapons capability itself provided a deterrent effect, he nevertheless argued that tests were necessary in order to provide a database for further research. Stating that theoretical work alone on weapons was not enough and that practical testing was needed, he added, 'If you are weak, people will try to take advantage of it.' It is clear that Chidambaram's insistence on the necessity of actual tests was in fact an advocacy of nuclear weapons.

**W**hile the actual history of the development of India's nuclear option and the steps leading to its being exercised are yet to be traced in detail, it is clear that the atomic energy and defence research establishments had, for some time prior to Pokhran II, actively advocated nuclear weaponisation. This is in itself a matter of serious concern. But it is even more disturbing when we consider the nature,

the intellectual level and quality of the political stances and attitudes that the atomic energy and defence research establishments display on nuclear weapons.

**S**everal leading scientists have, after the tests, rivaled each other in a display of boastfulness and jingoism. Abdul Kalam claimed that the nuclear threat had been vacated while Raja Ramanna claimed that the nuclear tests had provided security to India. Chidambaram himself returned to his vision of a strong India in an interview to *Frontline* (5 June 1998). His reply to the question, 'Should we have nuclear weapons or keep the option open?' is worth quoting in full:

'No comment.... The most important thing is that India must become strong. The greatest advantage of recognised strength is that you don't have to use it....everybody knows you are strong. Only when people see you as a weak country, they pressure you. We are a big country. We must learn to behave like a big country of one billion people. We should constantly remind ourselves of our strength.' This is a remarkable statement, marked both by hawkishness as well as a dangerously simplistic understanding of politics.

Kalam has not lagged behind in similar remarks. At his first press conference post-Pokhran, he broke off a technical exposition to remark on 'how a nuclear-armed India will be free of the fear of foreign invasions which have constantly remoulded the ancient Hindu civilisation' (*The Times of India*, 26 May 1998). He added: 'For 2,500 years India has never invaded anybody. But others have come here, so many others have come.' Whatever the voting preferences of Chidambaram and Kalam in terms of political parties, it is clear that their views on nationalism are

remarkably close to the ultra nationalism of the BJP and the Sangh Parivar.

There is another equally disturbing aspect of the attitude of the atomic energy and defence research leadership. It has displayed a marked enthusiasm for weapons, shorn of the sobriety that characterises statements on nuclear weapons by scientists (including those who are involved in arms control and defence related work) the world over. Chidambaram, in the *Frontline* interview referred to above, says about Pokhran II: 'This was my ambition for many years. This has now been achieved.' Kalam is moved to poetry by the tests. Addressing the gathering at a function to felicitate him (*The Times of India*, 28 June 1998), he claims: 'I heard the earth thundering below our feet and rising ahead of us in terror. It was a beautiful sight. It was a triumph of Indian science and technology.'

It is important to emphasise that what is at issue is not simply language. The enthusiasm displayed in these statements seems more like an attempt to play the role of latter-day Oppenheimers and Tellers. The point is that fifty years after Hiroshima and Nagasaki, and after all that has happened in the realm of nuclear weapons since then, such statements are simply expressions of an anachronistic and backward attitude to science and society issues. The engineering details of nuclear weapons may be classified material. But the debate over the political, social and moral aspects of nuclear weapons has spawned a vast literature, unclassified and easily accessible, that does not seem to have made any impression on these personalities.

Other sections of senior scientists of the atomic energy and defence research sectors of the Indian scientific community have done no better

in their reactions after the nuclear tests. The most common sentiment, expressed both in public and in off-the-record statements to journalists, is that they are happy that they have been given a chance to prove their competence. This is a naive attitude that entirely misses the point about the social responsibility of science and scientists. Such an attitude speaks not of political innocence but of the lack of any sophistication in understanding the implications of science for society.

It is thus that one needs to examine the question of the distortions that are likely to arise in the priorities of Indian science. The manner of distribution of resources, scarce as they are, between various sectors of S&T in the country is in essence a political choice. Given the political stances of those in Indian science who are in high favour today and the BJP-led government's own attitudes, the outlook for science causes serious concern.

Any move towards full weaponisation would entail the diversion of resources from other sectors to atomic energy and defence research. While the first post-Pokhran budget shows no definite signs of a massive investment for weaponisation, one must nevertheless note that the increase in expenditure in S&T has gone almost exclusively to the atomic energy and space sectors. Other ministries that cater to the requirements of the rest of Indian science have had to be content with very modest increases that will simply cover rising costs. The university sector in S&T research, the hardest hit resource-wise in recent times, has little to look forward to.

But the real damage could well happen over a longer time scale. Chidambaram has spoken of the need in India of a military-industrial complex (sic!): 'The sinews of S&T which spur development are also the founda-

tion on which national security (rests)... India needs to build up an MIC which can ensure security on the one hand and catalyse development on the other.' (quoted by Praful Bidwai in *The Times of India*, 1 July 1998). These are notions that are obviously contestable and need to be firmly opposed.

First, the Indian defence forces have always been heavily dependent on imported technology and equipment. The argument that military requirements need to be satisfied immediately by imports will continue to win over any argument about depending on indigenous technology. Sanctions may force some changes but this attitude will not go away so easily.

Second, there are several peaceful S&T projects which, if taken up, will catalyse technological development far more effectively. Nuclear power reactors, being more complicated systems, require a greater variety and range of technological inputs and will obviously fit this catalyst role much better than nuclear weapons. Even a blue-sky research project like building a particle accelerator could be a better choice compared to weapons. Similar arguments may be made by comparing missile development with the development of capabilities to launch, build and maintain geostationary satellites.

Third, technology development driven by military S&T requirements could hardly be expected to be oriented towards solving the basic problems associated with underdevelopment and the pursuit of sustainable integrated development strategies. Only in the reckoning of Prime Minister Vajpayee (and his friends in the Sangh Parivar), who cynically described India's nuclear weapons as 'India's due, the right of one-sixth of humankind,' who announced from the Pokhran

test site the slogan of *Jai Jawan, Jai Kisan, Jai Vigyan* and who declared 11 May 1998 as National Technology Day, would Chidambaram's strategy for development be welcome.

**C**learly, the original Nehruvian vision of science as an integral tool in the task of development has met its severest challenge so far. Even the sharp critique of this vision that emerged in the days of liberalisation and so-called economic reform did not pose the dangers to indigenous S&T that appear in today's scenario. The Nehruvian vision had its share of naivete in its underplaying of the role of socio-political change as an important aspect of development (land reforms were never as important as the Green Revolution). But it had two, not inconsiderable, merits. The first was in having a humane and peaceful worldview as its fundamental premise and the second was its strong link to secular and rational thought. Within this paradigm, from the viewpoint of democratic and progressive public opinion, the investment in advanced science and technology was an investment for the future, an attempt to keep up with the knowledge explosion of the twentieth century, even as the basic tasks of development were attended to.

The new paradigm being foisted is one that rejects both the fundamental premise of peace and humaneness and encourages links with irrational jingoism and an anti-secular outlook. Advanced science and technology in India is sought to be associated with military might and the dreams of a political formation, the Sangh Parivar, that bases its worldview on fundamentally irrational premises.

But even as this attempt is made the rest of the scientific community in India, outside the atomic energy and defence research sectors, has

remained a silent spectator. There is some evidence, noticed particularly by observers inside the scientific community, that the silence hides a deep unease at the unfolding pattern of events. But very little of this has been visible. The interventions by senior scientists in the post-Pokhran debate have been markedly limited, characterised by an unwillingness to come to grips with the central issue of the correctness or otherwise of the decision to test and the subsequent path of nuclear weaponisation. Some of them have weakly defended the claims of scientific achievement, a defence that must appear to thinking laymen and non-scientists as merely an unwillingness to criticise their colleagues.

**I**n all countries with a developed scientific community, the national academies of sciences and engineering have seriously engaged with the issues raised by nuclear weapons, and have expressed their independent evaluation of what their country's nuclear policy should be. In striking contrast, the academies in India appear to have been stunned by Pokhran II into silence. Even while the declaration of nuclear weapons status by India has led to grotesque celebrations, India's scientific leadership, has not stepped out in public to speak up for sobriety and educate citizens on the scientific truth of the horrors of nuclear war.

The few voices from the scientific community that have spoken up come mainly from young scientists in the network of national laboratories and some others from institutions of higher education across the country. One hopes that these voices, though still a minority, will contribute actively to eventually help turn science in India more firmly in the direction of peace and development.

# Security, morality and national pride

VINOD RAINA

AS the dust (euphoria) from the five nuclear tests at Pokhran in mid-May settles down, the real issues (like the consequent radioactivity) need serious and sustained attention. The future of millions in the sub-continent depends on our ability to grapple with competing interests, within and between the two countries, India and Pakistan, in a peaceful manner.

Among a host of reasons that have been advocated favouring nuclear weaponisation in this country, two stand out – national pride and security. Consider national pride first. Jingoistic scenes immediately after the tests and statements by national leaders and sections of the national media suggest the tests indicate a great achievement of our science and scientists, one that has enhanced our national pride immensely. Whereas the prime minister suggested adding *vigyan* to the two prevailing *jai's*, *kisan and jawan*, The Times of India editorially saw the tests as the triumph of *gyan vigyan*. As a *jai vigyan* and *gyan vigyan* activist, I find it compelling, as would thousands of my co-activists of the People's Science Movement (PSM) working in different parts of the country, to respond to such exhortations. If science and scientists are to be glorified by the *jai vigyan* slogan, should it be for reproducing an old technology meant for mass destruction? Likewise, does arming oneself with such weapons indicate *gyan* (wisdom)?

At the heart of the PSM movement in the country is the realisation that science has been used for destruction, whereas the need is to use it for people's development—for providing

education, drinking water, basic health, security to small agriculturists and manufacturers, local area planning, watershed development and so on. The PSM movement uses the term *gyan vigyan* precisely to denote that science without wisdom is destructive. That these terms have been appropriated by politicians and their supporting media to glorify weapons of destruction needs to be strongly protested against. Do these nuclear tests indicate such a stupendous scientific achievement that we ought to feel unbounded national pride? And is raising moral questions about the possession of weapons of mass destruction tantamount to nurturing an anti-national feeling?

A cursory look at the history of atomic physics would reveal that most of the seminal and path-breaking scientific work that led to the bomb (nuclear fission) was completed by 1940. The technology was worked out by 1945, confirmed first by the successful test at Alamogordo and later by the devastation at Hiroshima and Nagasaki. Many scientists saw James Chadwick's discovery of the neutron in 1932 as a key to atomic fission, and speculation that the powerful forces holding together the nucleus of the atom could be released surfaced immediately thereafter.

Having been rebuked for not attending a meeting of a British committee of experts on defence against enemy submarines, one of the greatest among the atomic scientists and head of the Cavendish Laboratory where Chadwick worked, Ernest Rutherford retorted thus, 'Talk softly, please, I have been engaged in experiments

which suggest that the atom can be artificially disintegrated. If it is true, it is of far greater importance than war.'

Engaged in rivalry, sometimes bitter, in the interpretation of experiments regarding artificial radioactivity with their German counterparts Otto Hahn and Lise Meitner, the French couple Joliot and Irene Curie while receiving the Nobel prize in Physics in 1935 commented, 'We are justified in reflecting that scientists who can construct and demolish elements at will may also be capable of causing nuclear transformations of an explosive character...' The possibility struck the Hungarian physicist Leo Szilard, who hated war and military, as a thunderbolt: 'It occurred to me in October 1933 that a chain reaction might be set up if an element could be found that would emit two neutrons when it swallowed one neutron. At first I suspected beryllium, then some other element like uranium. But for some reason or the other the experiment was never carried out.'

**B**ut many others did carry out the experiments, notably Enrico Fermi at Rome. Though they did not realise that they were witnessing nuclear fission for a couple of years, the realisation that it was possible and had already been achieved finally dawned on the awe-struck scientists spread all over Europe and many who had taken refuge in America to escape Hitler's fascist persecution and war.

The technology of the atomic bomb is more than 50 years old, and predates the transistor, the chip and obviously the computer, jet propulsion for both aircraft and missiles, lasers and the lot. On the threshold of the 21st century the science and technology of the atomic bomb, both of the fission and fusion kind, along with electricity, motor transport and wireless transmission, is old technology.

One wonders, therefore, why political leaders and the somewhat irresponsible media are projecting the 1998 tests as a matter of great scientific achievement and national pride.

**T**he sense of achievement, certainly in the political and government controlled technocratic quarters, may be an expression of the success of the clandestine nature in which a nuclear programme has to function in countries like India and Pakistan in the prevailing international nuclear regime, replete with mandatory disclosures and checks on fissile materials and nuclear facilities. But that clearly needs to be distinguished from glorifying scientific achievements. Fooling the American spy satellites from observing the preparations at the test site may be of great tactical value militarily, but it by no means measures up as a great scientific achievement. Maybe the confusion is deliberate, since the clandestine nature cannot be publicly acknowledged. Projecting it as 'a great scientific achievement' is a good cover to fan nationalistic passions and try and win mass support for something that is otherwise morally and ethically abhorrent.

The moral and ethical questions about nuclear weapons are irrevocably entwined with their scientific history, existing much before they struck home in full force after the horrors at Hiroshima and Nagasaki. The very scientists who pieced together the fission puzzle were greatly perturbed by what they were doing. In their histories one discerns, if at all, a muted sense of achievement and glory in their doings and more concern for the consequences. It must be remembered that they were working at a time when fascism was taking over Europe and many of them, concerned that rampaging Germany may make the ultimate weapon and put a permanent

stamp of fascism on the entire world, in their error, gave the secrets to the Allies, and then there was no stopping. One such scientist, Paul Langevin, tried to console a student of history who had escaped Germany thus, 'You are taking it much too seriously,' said he. 'Hitler? It won't be long before he breaks his neck like all other tyrants. I'm more worried about something else. It is something that, if it gets into wrong hands, can do the world a good deal more damage than those fools who will sooner or later go to the dogs. It is something that – unlike him – we shall never be able to get rid of: I mean the neutron.'

Leo Szilard was the most energetic among the atomic scientists to make his community realise the possible consequences of splitting an atom. As early as 1935, he approached a number of atomic scientists and asked them whether it would not be advisable, in view of the dangerous consequences of their present studies, to refrain, at least for the time being, from publishing any future results of their investigations. His suggestion for the most part was repudiated.

**D**espite this many of these precursors of post-World War II science, who took the entire world for their province, considered the moral consequences of splitting the atom deeply. 'Deny the powerful and their warriors entry to your workshops,' they warned the coming generation of research workers, 'for such people misuse the holy mysteries in the service of power.' Little did they realise that their suggestion to President Roosevelt to counter a possible German atom bomb would lead to the Manhattan project actually fabricating such a bomb to be used, not against a defeated Germany, but a collapsing Japan, and forever enable the powerful and their warriors not only entry

into their workshops, but to take over and control them.

**T**hese snippets from the history of atomic physics should be adequate to indicate that making atomic weapons at the end of the 20th century is merely rehashing an old technology of mass destruction that always works – there is no record of an atomic test that failed. To gloat over it as a great scientific and national achievement without any sense of moral outrage which has been felt by millions since 1945, including by the very scientists who discovered the process, is evidence of a deplorable sense of human values among the powers that be and their warriors in a country where the same powers make such a fanfare of celebrating Mahatma Gandhi's centenary.

There is enough reason to be proud of the scientific enterprise within the country, both in basic and applied sciences. Whether in the area of power, transport, agriculture, health, or basic sciences, the country's scientific infrastructure has shown that it has the ability to function in a self-reliant manner, if allowed necessary support and freedom of functioning. But it is a matter of serious concern that it is precisely in these areas that our abilities are being dented to accommodate competing foreign investments, while the ruling powers are generating a mass hysteria to gloat on our ability to manufacture weapons of mass destruction at enormous costs.

Providing basic health, clean drinking water, sustained power and domestic energy, adequate food and proper education to all the citizens of the country are far greater scientific challenges than manufacturing nuclear weapons and their delivery systems. Sadly, whereas we do have the requisite scientific ability to do so, for which we truly feel proud, the political agendas are at complete vari-

ance with our abilities and people's needs.

National security is the other major reason for opting for nuclear weapons – Pakistan and China cited as immediate threats. Many questions have been and will continue to be raised about such threat perceptions justifying nuclear weapons. If the situation of war in 1945 justified for America the actual use of the weapon, the justification during peacetime is centered on the concept of deterrence. The long experience of the Cold War and the disintegration of the Soviet Union ought to have been a real lesson for countries like India and Pakistan. The Soviet Union did not finally dissolve due to nuclear bombardment, but due to 'economic weapons' – the costs of manufacture and maintenance of a huge arsenal and all that goes with it, helped reduce it to a basket economy from which the region is yet to recover.

**I**t ought to be obvious that sovereignty is no longer attacked only militarily, but that in a market-based globalised world, it is being increasingly undermined, particularly in countries that have opted for a non self-reliant path and are internally weak, through trade and economy. Heavy investments in defence and the maintenance of a nuclear arsenal can only enhance the economic insecurity of a country like India, while providing an illusion of territorial invincibility. That economic insecurity can lead to disintegration has already been witnessed. Turning the argument around, suppose a country with nuclear weapons attacks another without such weapons, thereby lacking capabilities of deterrence, will that remain a bilateral war? Wouldn't economic compulsions force a distant nuclear weapons state to retaliate against such actions? And is that not deterrence?

If an economically strong country like Japan with so much more at stake, surrounded by nuclear weapon states and unfriendly neighbours, opts for a non-nuclear security option, what compelling reason does India have for nuclear security? That Japan has a security pact with the United States should make it feel more insecure than secure, given their economic conflicts and competition. Yet, Japan continues to exist as a world economic power. Will the Kashmir question be resolved faster now that both governments have demonstrated their nuclear potency? The immediate fallout seems to indicate that the Kashmir issue has got worse for India since third party mediation is now receiving stronger support.

**T**he arguments follow familiar terrain regarding the question of security. Instead of repeating them, it would be more meaningful to re-examine the very concept of security. Issues surrounding the Second World War and the ensuing Cold War phase of international politics have hegemonised the notion of 'security' in the latter half of the present century. Briefly, the two terms, peace and security, have predominantly been used in the context of external aggression, implying that avoiding war between nations is tantamount to sustaining peace, and that the ability to avoid or stand up to external aggression implies defence of the nation, or security. From such a viewpoint, militarisation and war preparedness are seen as acts of defence and security maintenance, rather than as intent of potential aggression, even though the two are clearly interchangeable, and have proven to be so.

How exactly must we understand peace? To see it as opposite of war is too restricted a meaning. There is little doubt that conditions of war, whether in Bosnia, Afghanistan or

Iraq, do create a great deal of insecurity in large populations. Their everyday peace is replaced by a constant worry regarding possible loss of life, property or injury, to themselves or to their loved ones. Peace among warring nations or communities does, obviously, provide a sense of relief and security to the concerned populations.

**B**ut do communities or large populations necessarily live secure lives at times when they are not engulfed by war-like conditions? The answer has to be no. War is an extreme form of conflict and produces special conditions that we associate with the term war. Conflicts can and do exist without war-like conditions, producing varying degrees of insecurity and lack of peace in communities. It is, therefore, essential to make sense of the terms peace and security in conditions where war is absent. Peace and security are conditions under which people and nations may improve their quality of life, live without fear, worry and stress, are secure from injury and loss of life, maintain good health, and pursue vocations, both productive and cultural, in harmony with nature and other groups and communities. Even in the absence of war there is little peace and security of this kind in countries like India and Pakistan.

If the United Nations, particularly through its Security Council, is the agency for ensuring peace among warring nations, development is propagated as the vehicle to utilise such peaceful conditions to make the life of people more secure—from hunger, disease, back-breaking labour and general poverty and impoverishment. The post-war years have seen a blossoming of development with, yes, many localised armed conflicts, though nothing like the Second World War. Yet peace and security eludes large populations of the world. Secu-

rity during peacetime is therefore far more elusive than in conditions of armed conflict.

This is perhaps why the United Nations, cognisant of the fact that human security in contemporary times has been eroded, and has to be explored and ensured in many dimensions, embarked on major interventions in recent years, such as the summits on environment in Rio, women in Beijing, social development in Copenhagen and human rights in Vienna. This is an affirmation of the fact that human security involves all these aspects: environment, food, gender, human rights and basic needs like health, education and welfare. Since these conditions were expected to be met and fulfilled through development, it is therefore a tacit acceptance of the fact that world development as pursued in post-war years has not really ensured such security for large populations. The question of lack of peace and security would, therefore, appear much more linked to the nature and form of development pursued in contemporary times than merely to conditions of armed conflict and war.

**I**t is this question we need to address when thinking of security rather than jingoistic notions of war, which have unfortunately been fanned due to the nuclear weapons programme of the two neighbouring countries. It is a fact that as long as there are countries like the P-5 who enjoy a nuclear status, the world cannot be free of a threat from nuclear war. But complete disarmament cannot be achieved by arming oneself; it can only induce others to do so. And as stated earlier, it is the international controls on availability of fissile materials and technology rather than any great scientific feat that may have hampered other countries from going nuclear, though as has been

demonstrated, particularly by Pakistan, clandestine operations can overcome many of these obstacles.

**E**ven though the present government has given reason to other countries to think of pursuing a nuclear rather than the path of disarmament, it needs to be stressed that a vast majority of Indian people, represented not only by the People's Science Movement but many other movements, do not support such an action. The underlying argument that it has now ensured greater security for the people is highly questionable; that the costs for providing such illusory security shall actually affect true security is already apparent.

The parliamentary bill to declare education as a fundamental right, which was to be introduced in the current session, has been quietly shelved. The financial implications of the bill, somewhat undervalued by a previous committee, required that the government allocate Rs 40,000 crore towards education during the ninth plan. Apparently, the present government feels that such a financial commitment is not feasible, resulting in the bill being shelved.

If the Indian state cannot commit to provide the very basic security that comes with education because of a lack of funds, does it have any right, moral or legal, to embark on an illusory but resource depleting security programme based on weapons of mass destruction? Despite the highly publicised initial jingoism, signifying that the Indian power elites and their city-based advocates had finally found a Viagra for their missing potency, it will hit them hard when ordinary people reject such medication at the hustings the next time around, simply because people need and seek food, gender and social security rather than nuclear weapons based national security.

# The legal status of nuclear weapons

M. SIDDHARTH

ON 8 July 1996, the International Court of Justice (commonly referred to as the World Court) broke the legal silence surrounding the issue of nuclear weapon threat or use. This was an outcome made possible by a prior request of the United Nations General Assembly to the World Court. In keeping with Article 96, paragraph 1 of the UN Charter, the UNGA had requested the premier Court to respond by means of an advisory opinion to the following question: 'Is the threat or use of nuclear weapons in any circumstance permitted under international law?'<sup>1</sup> The Court ruled that nuclear weapon threat or use is 'generally illegal' and that there exists an

obligation to '...pursue in good faith and bring to a conclusion negotiations leading to nuclear disarmament in all its aspects under strict and effective international control' (831). This legal development is indeed a welcome source of support to the ongoing international citizen's campaign aimed at delegitimising these weapons of mass destruction.

However, the finding of 'general illegality' suggests that the process of a comprehensive outlawing of nuclear weapons under all circumstances is far from complete. In its most controversial paragraph, 105(2)E, the Court recorded that it '...cannot conclude definitively whether the threat or use of nuclear weapons would be lawful or unlawful in an extreme circumstance of self-defence, in which the very survival of a state would be at stake...' (831). Nevertheless, the Court, in the main text of the majority opinion qualified the criteria determined by international law for self-defence to be invoked. The Court

\* The author wishes to acknowledge the valuable comments from Kanti Bajpai and B.S. Chimni.

1. International Court of Justice: Advisory Opinion on the Legality of the Threat or Use of Nuclear Weapons. 8 July 1996, General List No. 95. *International Legal Materials*, Vol. 25, No. 4, 1996, pp. 809-938, p. 819. All parenthesised entries which follow are from the same source.

cited Article 51 of the UN Charter, which requires that 'measures taken by Members in the exercise of this right of self-defence shall be immediately reported to the Security Council and shall not in any way affect the authority and responsibility of the Security Council under the present Charter to take at any time such action as it deems necessary in order to maintain or restore international peace and security.'<sup>2</sup> The Court also upheld the view that '...a use of force that is proportionate under the law of self-defence, must, in order to be lawful, also meet the requirements of law applicable in armed conflict which comprise in particular the principles and rules of humanitarian law' (822).

**T**he World Court played a useful role in examining all legal provisions in international law which were viewed as relevant in the rendering of the July opinion. This involved a detailed consideration of the conventional and customary bases of international law, the principles of international humanitarian law, the issue of force in international relations, the dangers posed to the environment by nuclear weapons and, finally, the question of threats in international engagement between states. Although all these elements remain important to the advisory opinion, what singly retains its fundamental salience is the Court's vindication of the principles of international humanitarian law in armed conflict.

International humanitarian law consists of an amalgam of the Hague Conventions which seek to regulate armed conflict and the Geneva Convention which protects victims of war

as well as civilian populations. The Court cited relevant provisions which serve as a useful reminder of a state's obligations during armed conflict. According to Article 22 of the 1907 Hague Regulations, 'the right of belligerents to adopt means of injuring the enemy is not unlimited' (827). The Court also drew attention to the 1868 St. Petersburg Declaration which prohibits the use of weapons 'which uselessly aggravate the suffering of the disabled men or make their death inevitable' (827). In similar vein mention is made of Article 23 of Convention 4 of the 1907 Hague Regulations which prohibits the use of 'arms, projectiles or materials calculated to cause unnecessary suffering' (827).

Besides these provisions, what is of significance is the Court's reaffirmation of the 'intransgressible' principles of customary international law. These include the need to maintain a distinction 'between combatants and non-combatants...consequently never use weapons that are incapable of distinguishing between civilian and military targets' (827).

**S**econd, the Court recognises that, 'It is prohibited to cause unnecessary suffering to combatants: ...accordingly prohibited to use weapons causing them such harm or uselessly aggravating their suffering' and third, 'In cases not covered by this Protocol or by other international agreements, civilians and combatants remain under the protection and authority of the principles of international law derived from established custom, from the principles of humanity and the dictates of public conscience' (827). The Court also makes mention of a query raised by a 'small minority', '...that these principles and rules had evolved prior to the invention of nuclear weapons and that the Confer-

ences of Geneva of 1949 and 1974-1977 which respectively adopted the Geneva Conventions of 1949 and the two Additional Protocols thereto did not deal with nuclear weapons specifically' (828). The Court, however, confirms that '...there can be no doubt as to the applicability of humanitarian law to nuclear weapons' (828).

**T**he Court also endorsed the continued relevance of the principle of 'neutrality' which was '...aimed at preventing the incursion of belligerent forces into natural territory, or attacks on the persons or ships of neutrals' (829). This law, in the opinion of the Court, is viewed as of '...fundamental character similar to that of the humanitarian principles and rules, is applicable (subject to the relevant provisions of the United Nations Charter), to all international armed conflict, whatever type of weapons might be used' (829).

India, among several other states, affirmed the request for a rendition of an advisory opinion by the World Court in response to the United Nations General Assembly Request. The Indian memorial submitted to the Court supported any move towards a finding of total illegality of these weapons of mass destruction. It held '...that declaring the threat or use of nuclear weapons as illegal or unlawful would be a greater deterrent against any irresponsible use than treating such use as legal; and further where such illegal use is still resorted to, the international community would at least have at its disposal the right to condemn the user and demand cessation of the wrongful act and attach such other legal consequences as are prescribed in the law of state responsibility.'<sup>3</sup>

3. Indian Memorial Submitted to the ICJ - Status of Nuclear Weapons in International

2. Charter of the United Nations and Statute of the International Court of Justice, United Nations, New York, Chapter 7, Action With Respect to Threats To The Peace, Breaches of The Peace, And Acts of Aggression, Article 51, pp. 27-28.

India's support for a finding of total illegality apart from being endorsed by a number of non-aligned movement (NAM) states also found support among sections from within the Court's own jury. The Sri Lankan judge Christopher Gregory Weeramantry, in an 88 page dissenting opinion appended to the majority opinion argued meticulously in favour of the view that '...the use or threat or use of nuclear weapons is absolutely prohibited by *existing law – in all circumstances and without reservation*' (923).

Ultimately, it is important to recognise that the World Court Advisory Opinion is indeed a positive development in the direction of outlawing these weapons of mass destruction. The Court emphasised '...that it's reply to the question put to it by the General Assembly rests on the totality of the legal grounds set forth by the Court above (paragraphs 20-103), each of which is to be read in the light of the others. Some of these grounds are not such as to form the object of formal conclusions in the final paragraph of the opinion; they nevertheless retain, in the view of the Court, all their importance' (831).<sup>4</sup> Thus, while the Court did not explicitly state that nuclear weapon threat or use is prohibited under all circumstances, it did eliminate situations of nuclear weapon threat or use by affirming that the principles of international humanitarian law do operate in any armed conflict and that '...the use of such weapons in fact seems scarcely reconcilable with respect for such requirements' (829).

## Document

*The Indian memorial submitted to the ICJ—status of nuclear weapons in international law: Request for advisory opinion of the International Court of Justice.*

THE question whether nuclear weapons could be lawfully used in an armed conflict is regulated by international law, and in particular the law of armed conflicts and by principles of international humanitarian law. Under international law, use of force is prohibited in international relations. The prohibition contained in Article 2(4) of the UN Charter is so comprehensive and fundamental as to be regarded as a *jus cogens* or an obligation of an absolute character. On the basis of this principle it appears clear that any use of nuclear weapons as a measure of use of force to promote national policy objectives would be unlawful.

Most proponents of use of force, without denying the absolute character of the obligation contained in Article 2(4), contend that use of force by way of exercise of an inherent right of self-defence, which is preserved and protected under Article 51 of the UN Charter is admissible. However, the content and the circumstances under which the right of self-defence could be exercised is specified in the UN Charter itself and is related specifically only to an 'armed attack' in the

first instance. The same has to be reported soon thereafter to the Security Council and is subject to its right to take appropriate steps under Chapter VII upon a determination of the existence of a threat to peace, breach of peace, or an act of aggression.

It is further agreed that any use of force in self-defence has to be proportional to the means and ends involved or to the original wrongful use of force. However, the right of self-defence is to be regarded as a provisional measure or a remedy and hence as soon as other means or measures become available, the resort to self-defence through use of force has to cease.

Even though an opinion is expressed that the reference to inherent right of self-defence in Article 51 provides the basis for states to undertake a preventive action in self-defence in the form of self preservation, this, according to a more prevalent view, is not supportable. According to the prevailing view, the qualification of the right of self-defence by the word 'inherent' in Article 51 serves only to emphasise that the right is available to every state regardless of whether it is a UN member or not. Further, according to this view, the fundamental purpose of the UN Charter is to restrict the use of force by states to the utmost extent necessary, keeping in view Article 1(1) and Para 7 of the Preamble of the UN Charter. (See *Encyclopaedia of Public International Law*, Max Planck Institute, vol. 4 (N-2). North Holland Pub. Co., p. 272.)

It is even suggested that where one state preannounces an armed attack against another state, a hardly conceivable practice, preventive self-defence would be lawful!

In view of the above and given the strict limitations on the non-use of force and the right of self-defence, it is our view that use of nuclear weapons in any armed conflict as a first

attack would be unlawful under international law.

The question then for consideration is whether the use of nuclear weapons would be lawful as a measure of reprisal or retaliation if the same is used by an adversary in the first instance. Reprisals or retaliation under international law are also governed by certain specific principles. First, reprisals to be valid and admissible could only be taken in response to a prior delict or wrongful act by a state. Second, such reprisals must remain within reasonable bounds of proportionality to the effect created by the original wrongful act. However, reprisals could not involve acts which are *malum in se* such as certain violations of human rights, certain breaches of the laws of war and rules in the nature of *jus cogens*, that is to say obligations of an absolute character, compliance with which is not dependent on corresponding compliance by others but is requisite in all circumstances unless under stress of literal *vis major* (see G. Fitzmaurice, 'General Principles of International Law', vol. 92, *Recueil des Cours* (1957-II), pp. 119-120).

In other words, a nuclear weapon could not be used by way of reprisal against another state if that state did not commit any wrongful act or delict involving use of force. Second, when a state commits such a wrongful act or delict, the use of force by way of reprisal would have to be proportionate and as such if the wrongful act did not involve the use of a nuclear weapon, the reprisal could also not involve the use of a nuclear weapon.

Third, even where a wrongful act involved the use of a nuclear weapon, the reprisal action cannot involve use of a nuclear weapon without violating certain fundamental principles of humanitarian law. In this sense, prohibition of the use of a nuclear weapon

in an armed conflict is an absolute one, compliance with which is not dependent on corresponding compliance by others but is a requisite in all circumstances.

In view of the above, use of nuclear weapons even by way of reprisal or retaliation, appears to be unlawful.

In any case, if the wrongful use of force in the first instance did not involve the use of nuclear weapons, it is beyond doubt that even in response by way of retaliation, states do not have the right to use nuclear weapons because of their special quality as weapons of mass destruction. It is also clear further that any wrongful act not involving use of force at all under international law could not be redressed or attempted to be met with any use of force, with or without involving nuclear weapons.

This brings us to the question as to the legality of the use of nuclear weapons in an armed conflict on the ground that it is open as a measure of last resort under limited conditions and as a matter of military necessity. A basic principle of the law of armed conflict and particularly the international humanitarian law, which is contained in Article 22 of the Hague Convention IV (1907) states that 'the right of belligerents to adopt means of injuring the enemy is not unlimited'. Their right in particular is conditioned by Article 23 of the Hague Regulations prohibiting the use of poison or poisoned weapons; the 1925 Geneva Protocol prohibiting projectiles, asphyxiating, poisonous and other gases which incidentally prohibits also the use of weapons which could cause genetic disorders and illness which is likely to prolong for a considerable amount of time; and by the basic principle enshrined in the Declaration of St. Petersburg of 1868 prohibiting any weapon 'which uselessly aggravates the sufferings of disabled men or render their death inevitable.'

Moreover, the very purpose of international humanitarian law is to forbid 'indiscriminate attacks' and demand protection of civilians. 'Indiscriminate attacks' are generally defined as those that are not directed at any single military objective, those which employ methods or means of combat which cannot be directed at a specific military objective and those with effects which cannot be limited. In other words, indiscriminate attacks are those of a nature to strike a military object and civilians and civilian objects without distinction.

In addition to the above, the relationship between military advantage and the collateral damage involved also determines the legality of use of a weapon or a method of warfare employed. If the collateral damage is excessive in relation to the military advantage, the attack is forbidden.

Keeping the above considerations in view, it is easy to come to the conclusion that the use of nuclear weapons in an armed conflict is unlawful, being contrary to the conventional as well as customary international law because such a use cannot distinguish between the combatants and non-combatants on the one hand and could cause excessive injuries to the combatants making their death inevitable and could even cause widespread and long-term damage which in some cases could even result in what is called a 'nuclear winter'.

However, an opposite view was expressed by some that the law of war or the humanitarian law could not be deemed to prohibit the use of nuclear weapons as that law grew up mostly only touching the old and more marginal weapons. They claimed that nuclear weapons being weapons of modern warfare are outside the scope of such a law. It is also their view that recent attempts to outlaw some newer method of warfare by implications did not outlaw the use of nuclear weapons

in an armed conflict. Citing that almost all states are urging the conclusion of a convention to outlaw the use of nuclear weapons in an armed conflict, it is also argued that in the absence of any such convention their use is not prohibited. In the same connection the use of such nuclear weapons on Hiroshima and Nagasaki is also cited as an example of such legitimate use.

On the basis of above arguments, it is contended that international law does not provide for any blanket prohibition against the use of nuclear weapons and the legality of any specific use could however be appraised only in the total context of such specific use.

The above arguments in favour of the legality of use of nuclear weapons are convincingly contested. First, it was pointed out that the development of humanitarian law and the specific principles indicated above which have the status of customary international law do not distinguish between major or minor methods of warfare or between major or marginal weapons. Second, some of the earlier opinions regarding the legality of nuclear weapons were not based on information and knowledge now available about the devastating effects of the use of nuclear weapons and their incompatibility with the fundamental norms of humanitarian law. Third, more recent efforts which reiterated that customary law developed on the basis of the earlier declarations or conventions also did not make any distinction between various weapons or methods of warfare. Fourth, the international community often engaged in further clarification, codification and progressive development of the law even when the principles involved in such an exercise are already regarded as well-established in international law.

Examples of this kind of exercise are many and by way of illustration

of 1982 UN Convention on the Law of the Sea, various declarations and treaties concluded reiterating the UN Charter principles and the international humanitarian law itself could be mentioned. Fifth, the use of nuclear weapons over Hiroshima and Nagasaki does not make the use lawful if their use is otherwise prohibited by the law. On the contrary, the use of chemical weapons in World War I led to the negotiation of the Geneva Protocol outlawing their further use. The same should apply to nuclear weapons. Violations of international law like any law would only highlight the importance of complying with such law and do not make legal what is otherwise illegal.

The use of nuclear weapons in response to attack by a conventional weapon would not only patently violate the principle of proportionality, but also a nuclear response to nuclear attack would violate the principle of discrimination, humanity, environmental security and probably the principle of neutrality as such an attack would not distinguish between combatants and non-combatants—causing civilian casualties, ravaging the natural environment and contaminating the territory of neighbouring and distant neutral countries. Nuclear deterrence had been considered to be abhorrent to human sentiment since it implies that a state, if required to defend its own existence, will act with pitiless disregard for the consequences to its own and adversary's people.

Another question which arises in relation to the theory of deterrence is whether the keeping of peace or the prevention of war is to be made dependent on the threat of horrific indiscriminate destruction which justifies the stockpiling of such weapons at an enormous expense, in the hope that they will merely act as a deterrent but will not in fact be used. However, those who do not have such weapons would all the time be racing to build

them and those who already have nuclear weapons would continue to develop even more destructive weapons to maintain the superiority necessary for deterrence, and this would keep humanity in the perpetual fear of total destruction. A better and saner way to secure everlasting peace would be to ensure that not only are such weapons never used but also not made. The security of all nations would best be safeguarded by a nuclear weapon free world. If peace is the ultimate objective there can be no doubt that disarmament must be given priority and has to take precedence over deterrence.

The consideration of the question of legality of use of nuclear weapons is incomplete without consideration of the manufacture, production and stockpiling of nuclear weapons. Since the production and manufacture of nuclear weapons can only be with the objective of their use, it must follow that if the use of such weapons itself is illegal under international law, then their production and manufacture cannot under any circumstances be considered as permitted. Besides, the manufacture and stockpiling of nuclear weapons would constitute a threat of their eventual use.

In this connection reference may be made to the Conventions on Biological Weapons and on Chemical Weapons which, recognising the need to exclude completely the possibility of the use of such weapons, prohibit state parties to develop, produce, stockpile or otherwise acquire or retain the prohibited weapons. Those conventions clearly recognise and provide that the only effective way to prevent under any circumstances the use of a prohibited weapon is to ensure that no state undertakes the production or manufacture or retains such weapons.

Accordingly, where states are in possession of chemical or biological

weapons they are required to dismantle or destroy them under an elaborate procedure specified there in with built-in safeguards of international inspection. The need for these conventions was felt because a number of states had made declarations/reservations to the 1925 Geneva Protocol to the effect that they could use the prohibited gases, poisons etc., in case they were subjected to an attack by such weapons.

The Chemical Weapons Convention and the Biological Weapons Convention by prohibiting the production, manufacture etc., of such weapons under any circumstances preclude their use even by way of retaliation in cases where they have been used by one party to a conflict.

Thus, the use of nuclear weapons which is otherwise contrary to international law could only be effectively prevented by eliminating completely their production, manufacture and by ensuring the dismantling of existing nuclear weapons.

The production of weapons which have the capacity to destroy all mankind cannot in any manner be considered to be justified or permitted under international law.

It is also argued that declaring the threat or use of nuclear weapons as illegal or unlawful would be a greater deterrent against any irresponsible use than treating such a use as legal; and further where such illegal use is still resorted to, the international community would at least have at its disposal the right to condemn the user and demand cessation of the wrongful act and attach such other legal consequences as are prescribed in the law of state responsibility.

In view of the above, it is submitted that the threat or use of nuclear weapons in any circumstance, whether as a means or method of warfare or otherwise, is illegal or unlawful under international law.

# Making choices

MANJULA PADMANABHAN

[A bedroom. RANU and JEET are sitting in heavy armchairs facing the audience, staring with intense concentration at a bulky contraption with many wires emerging from its rear panel. It is in the place where the TV would normally be. The machine is on. Both watchers are bathed in the lurid glow from its screen. They both hold remote controllers in their hands, half-raised for action.]

[There is a knock on the door]

JEET: Come in.

[Enter HOMI, in haste]

HOMI: Ah...

RANU: You're very late.

JEET: Where's your clicker?

HOMI: (showing it) Here.

JEET: Come on!

HOMI: What's the score? (taking up a position behind both the armchairs, leaning on RANU's)

RANU: Getting there.

HOMI: (staring) My god...

JEET: (pointing) See that corner? All those towns... green! The choice-window will open in our district any minute now. Every household entered on the grid gets three seconds. That's the state-wise breakdown there (pointing) and just above it, the national position.

HOMI: My god. Forty-nine point seven-four-three-three-three-oh-two... shit. It's going to happen.

RANU: We've been waiting since morning.

JEET: The future of our country after all.

HOMI: The world.

RANU: But it's the country we care about, na?

HOMI: (watching the screen) Uh-oh-(starting to raise his clicker)

RANU: Not yet - not yet -

JEET: It doesn't matter. Choices don't register until that green light goes on.

HOMI: (subsiding) It's hard to believe it's really happening.

RANU: Why? It's been two years since we went nuclear. It was bound to happen some day. Or else - why have the bomb? Like having a gun but refusing it to use it when the robbers come to murder us.

JEET: And just look at this system (gesturing towards the machine). It's fantastic. Nothing could more reasonable or logical or democratic. The citizens themselves make the choice.

HOMI: Oh... I don't know. How many people can afford these things? How representative is it really?

RANU: It represents the choices of informed, responsible and wealthy intellectuals. People who have the resources and the ideals crucial for making a nation strong.

JEET: Like us.

HOMI: Do you really think it makes a nation strong to be doing this?

RANU: (sharply) What – are you one of the faint-hearts?

JEET: Look – look! The window's coming our way!

[All three tense up, their clickers raised]

RANU: Ready now – ours is the first neighbourhood on the grid – there's the map now, the first numbers in our series have been highlighted – there's the outer block... the one next to it... the one in front of it... to the side... the other side.

JEET: Now!

[A small green light on the machine starts to blink. Simultaneously, a beam of blinding white light erupts from the top of the machine. The three watchers activate their clickers. JEET's and RANU's flash green, but HOMI's flashes red. The machine's beam registers three red beams, a loud alarm sounds and the beam switches off.

[Silence in the room]

JEET: Shit.

RANU: I don't understand.

JEET: (not looking around at HOMI) It was him.

RANU: What?

JEET: (speaking softly) Him. Homi. It had to be. There's no other explanation. His clicker cancelled ours out.

RANU: (holds her head) Oh my god. My GOD! You fool! You idiot! I told you not to invite anyone – that's what the installation team warned us about – not to trust anyone at the time of the choice!

JEET: How could I suspect him? Known him since school. Bastard. Traitor. That's what you are. You know that? (his tone is deceptively mild. He addresses HOMI without looking at him.)

HOMI: (he has moved back a pace, but remains calm. Looking towards the screen) Not that it'll make a difference. (nodding at the screen) See? That last number's changed. Gone up.

RANU: But not thanks to us. We wanted to be counted too! It was our right! Our duty!

HOMI: And it was my duty to stop you. Or to try, at least. (looks at his clicker) Didn't think it would work so well.

JEET: (through clenched teeth) Bastard.

HOMI: You people don't understand what it means. You don't realize the horror.

RANU: You're a fine one to talk – who's causing the horror, you or us? Stopping us from doing what's right for the country.

JEET: (suddenly jumping up and around to face HOMI) It's the country's PRIDE, dammit! My father died to save this country from the British! And now – I'm not even allowed to press a bloody button in defence of the nation! Do you understand what you've done? It was my chance to be a hero, to make my mark on history –

and now you've gone and – and – bloody – RUINED it. (makes a sudden lunge and catches HOMI by the throat) I should kill you for this.

[The two men struggle briefly but HOMI is in better shape. He is able to prevent JEET from inflicting any real harm while making no retaliatory moves. The fight does not last long and JEET draws back before making an ass of himself]

JEET: (coldly) You're not worth the effort. Get out of my house this instant. I never want to see you again, hear from you, hear your name.

HOMI: And you won't! (gesturing towards the machine) The way those numbers are rising, in just over an hour and a half, maybe, none of us will be in a position to hear any names. Or anything else for that matter.

RANU: What's this nonsense you keep talking.

HOMI: Radioactive ash, that's what we'll be.

JEET: What d'you think – we're fools? Villagers? Maniacs? Traitor! Get out, get out.

HOMI: (stubbornly) – or worse. We could survive, after all. For a few hours. A few days. Weeks. Not that we'd want to survive. Our skin will be peeling off in sheets. Our clothes will be scorched onto our backs. Our eyes will melt down our cheeks. And the pain. We can pray that there won't be anyone left around to record our pain – but there probably will be. Plenty of remote-controlled recorders – at a safe distance of course – a great distance. There won't be any tourists visiting to see the Taj in a LONG while ... no. There probably won't be much of the Taj left to see. Or anything much else. We'll be the scenic sights soon. Whatever bits and pieces remain. Like the charred corpse that became an icon of the Iraq war. We'll be immortalized, some of us. With our mouths hanging open in screams heard only in nightmares. Made into posters. Carved in black granite. Tasteful memorials of tasteless deaths. Hard to say who among us. Hard to say which parts of us. Unlike Nagasaki and Hiroshima – today there are satellite cameras to watch us at a safe distance, Internet to hear us screaming! Maybe they'll use our voices! Make a famous choral arrangement out of it! Five thousand years of civilization – poof! One and a half billion people – poof! Uncounted treasures of art and culture and natural resources – poof!

[The other two have not been listening to him. RANU is holding her head and JEET is fiddling with the buttons of his clicker. His efforts result in different displays appearing on the screen on the machine. The screen is not visible to the audience, but the changes in light and colour are reflected on all three watchers]

JEET: Oh shut up. (still fiddling) It's not as if anything you're saying is news to us.

HOMI: Then how can you be so irresponsible! HOW!

RANU: (looking up) It's very simple. Only total morons would be unable to work it out. It's either us or them, na? If we don't drop the bomb on them, they will drop it on us. If that is the case, at least let us be first? Na? I mean, it's so obvious.

HOMI: First or last what does it matter! No-one will survive this conflict! No-one will be around to savour this victory! What is the point!

JEET: People like you are such ninnies. Of course some people will die. That always happens – some people are dying all the time. Of hunger, of disease – what's the difference if they die of the bomb instead? At least they'll be dying in the name of the country's prestige!

HOMI: You're not afraid of being the ones to die, are you?

RANU: NOT AT ALL! (holds her head up proudly) If our parents and grandparents could give their lives for the freedom struggle, then we can give our lives for the pride of the nation.

HOMI: There's no pride attached to being the first to drop the bomb on innocent civilians.

JEET: Yet, look at America? Didn't they drop the bomb? Didn't they rewrite history so that they can forever look shamefaced but all the time making more and more bombs themselves? Dropping them god knows, here, there, everywhere – who can say? They're the ones controlling the news with their CNN, their BBC, who can say whether they have been quietly dropping bombs on Russia, Cuba, the moon. But if they can make bombs and drop them, so can we! Huh! These westerners! Think they're so smart! Think they know more than us – with their soft drinks and their chicken burgers! We'll show them.

HOMI: We certainly will. We'll show them how well two desperately poor nations can fall into the traps of cynical arms dealers – and perhaps scientists too – who don't care either way what happens to a billion and a half starving peasants – don't you understand? Nothing that we do is considered proud or glorious in the eyes of the West. They see us as miserable, starving, worm-infested, plague-ridden lepers! And vain and arrogant to boot. And breeding like cockroaches in an open sewer. What do they care if we blow ourselves up? As far as they're concerned, countries like ours, which don't contribute patentable ideas to either technology or entertainment, whose only offering to the planet's wealth is more hungry mouths, whose average quality of life is lower than that of the pets they keep

in their homes – we just don't matter. Who knows? Maybe they've engineered this situation – maybe they want us to cancel ourselves out of existence, make the world lighter by a billion heathen souls – make more place for themselves.

RANU: Poor man or rich – everyone respects a loaded gun.

HOMI: Not if it's being held by a chimpanzee.

JEET: Are you calling us chimpanzees?

HOMI: No, I'm calling us misguided. Misguided! Who d'you think designed those bombs? They did. Who d'you think sells those bombs? They do. Who d'you think dies by those bombs? They don't.

RANU: We've all got to die some day. At least if we die this way, we'll be dying for the nation. That's better than just dying of – of – old age! We'll die as warriors, as martyrs. Let the west think what it likes – we don't care. We've still got to defend the nation.

JEET: And even if we all die – though we won't. There are too many of us. But even if we do – so what? There are enough of us abroad. Enough to keep the nation's flag flying. All those NRIs – they'll be able to come back at last, take over from where we left off – rebuild our glorious heritage from scratch.

HOMI: Glowing with radiation.

RANU: Ahh – you and your sissy fears! They've fixed a thousand problems before this, they'll find some way of fixing that.

HOMI: No-one's found a cure for the common cold yet.

JEET: Who's talking about colds? We're talking about radiation. We can overcome radiation – we've overcome five thousand years of history haven't we? And what is radiation after all? You can't even see it. It's so small. Just some sort of new-fangled rubbish – who knows? Perhaps yoga can cure it. Or transcendental meditation. Our rishis will find supernatural ways of combating radiation. Our legends have the answers to the universe. Ycu'll see – the bombs will destroy a billion people? Who cares – another two billion will rise up to take their place. No-one can say that we Indians don't know how to fill a nation with people!

HOMI: How easy it is to be callous about the lives of others!

RANU: And our children will survive, after all. Most of them, anyway.

HOMI: Yes. I was waiting for you to bring up the subject of your children.

JEET: In the end – that's all that matters. And frankly, let's be crude: those of us who matter, those of us who have invested well and care about the nation's future – we've sent our children abroad. So all right, maybe the

country's been in a bit of a mess recently – but when this-all is over, and both sides have blown themselves up to bits – there'll still be the children. Our children. They'll come back. They'll be proud of what their parents did for them.

HOMI: By sending them abroad, you mean? By protecting them from the hardship of growing up in their own glorious heritage?

JEET: Don't be stupid. When they go there, they're safe from the dangers of growing up here. After all, here there is pollution, disease, this and that. There they will learn whatever there is to learn about modern life, then when they can come back, they can teach it to us.

RANU: (suddenly) Look – just look at the screen! The numbers are climbing like anything!

HOMI: Have you spoken to your children recently about their views on life? Have you ever wondered why they don't write so often any more?

RANU: Just look – even if we couldn't add our votes – at least the rest of the country is going ahead.

JEET: They're busy, that's all.

HOMI: Maybe you should ask them yourself.

JEET: How can we? They're in the States.

[HOMI steps back a pace and knocks on the door. Immediately, two young people enter. They are BOO and DAX, dressed in tank tops and shorts. BOO is a well-fleshed young woman whose hair has been dyed magenta. DAX is six feet tall and wears rings all over his face]

BOTH: (unenthusiastically) Hi, Mom. Hi, Dad.

RANU: (standing up) Bharati! Ishan! Wh-what are you doing here!

DAX: (adenoidally) We just hadta come Mom – we just hadta tell ya that what y'all are doin' is WRONG!

BOO: We learnt all about it in our social science classes.

DAX: And we're, like, really, really PISSED.

[Both parents look bewildered]

BOO: He means, like, it's really UNCOOL to drop bombs, okay, Mom? I mean – hey. Dropping bombs is for nerds, okay? Dad? I mean, I hadta write a paper last week about my home culture and roots and stuff? And this nuclear deal was going down? So my class was like, what's with your country, you know? So you know what? I – I – (pause, shrug) changed my country.

RANU: What...?

BOO: (tosses her head defiantly) I said I was – was – half-black, half-Mohawk! I said that my real parents died when – when we were on the trail and then I was kidnapped by these, like, alien tourists? Who came to see the Niagara Falls? And they took me all the way to India and now – everyone thinks I'm from that dumb

country where no-one does anything but drop bombs all day! Destroying the earth's habitat and all the chipmunks and orangutans and stuff. So I said it wasn't true and that I'd never felt at home in that place and that to prove that I wanted to save the world from all those mad Indians I'd go and tell my, like, foster parents to just stop being so weird. And you know what? My whole class cheered! They even paid for my ticket so that I could come and talk to you guys.

DAX: Yeah, Dad. The same for me. It's really weird. It's really spooky. I mean, bombs. Who needs them? I said I was from Tonga. Or Siberia. Anywhere but India – India's like bad news, Dad. I'd be lynched if I said my own parents were sitting here dropping bombs on the opposition.

BOO: We just thought we'd come home and tell you that – Mom? Dad? – we really love you, but – hey. We've grown up.

[JEET and RANU are looking shell-shocked]

HOMI: (looking at the screen) How sad. All this effort, all this time – all to waste. (he points at the screen) We've run out of time, all of us.

RANU: Why d'you keep saying things like that!

HOMI: (pointing again) See for yourself – we're just minutes away from the fifty-percent mark!

JEET: How little you understand. Reaching the fifty-mark means that fifty percent of all Indians are in favour of dropping the bomb on our enemies! Who's running out of anything? They'll be vapourized! And we'll be safe and fearless!

DAX: What? You mean – you mean – it's happening? Like... now?

JEET: (squaring his shoulders) Some day, my son, you'll think back to this moment and be proud of your father. Of the ideals he stood for. Of the brave, strong and vibrant country that he – and others like him – built, out of the blood, guts and atoms of –

BOO: But – DAD! There won't be anyone left! Nuclear war reformats the planet, Dad! Control-alt-delete, no retry, no save. Grand general failure of the whole programme.

RANU: Bharati – where did you learn to speak to your father in that voice?

DAX: In high school, Mom. The same American high school that you and Dad sweated bricks to send us to. You thought you were sending us for an upgrade but... too bad. They couldn't upgrade us without changing our DOS. Now our systems are incompatible. Error messages every time we open our mouths.

HOMI: (staring at the screen) Such a waste. Such a waste!

JEET: (squaring his shoulders even more) All right. I can't understand most of what you're saying, but never mind. One day, you will understand me. One day, you will stand tall.

HOMI: – and supposing, instead of our striking them when we reach the fifty-mark, they strike us first? Supposing their citizens are also standing in homes just like this one, watching their versions of these machines, watching the numbers mount past fifty – and what if they did all of that just half an hour before we did?

[There is a brief silence – then from the machine, an alarm sounds]

RANU: (in a hushed voice) The fifty-mark.

[Clicks from the machine]

MACHINE: (in a tinny, mechanical voice) Fellow citizens. Thank you for having chosen the safe and democratic option of nuclear war. You will be relieved to hear that this electronic referendum has not been in vain. Fifty percent of all those who invested in this great nation's security by buying the NuclearMate Optimizer have revealed their choice: we shall drop the bomb on our vile oppressors across the border. By the time this message is completed, the warheads will have been armed. Bring out the coconuts. Let this be a time of rejoicing. In one hour, Indian Standard Time, our beloved and ancient nation will heave a sigh of relief. Our enemies will have been vanquished. Our great and courageous leaders, who have been forced to take refuge in nearby Madagascar, will finally be able to return to their homeland in safety. *Jai hind*.

[More clicks. A digital version of the national anthem plays]

JEET: (waits only a brief moment) There! See? What did I tell you? You didn't believe me! (going up to HOMI) You fool! You custard-blood! You cheese-cloth! It's past the fifty-mark and – NOTHING'S HAPPENED!! (goes to DAX) Do you see, my son? The error of your childish, unmanly ways? (goes to BOO) And as for you, young woman, just you wait till I can spare the time to give you a good spanking! That's all you need – a spanking! For being a stupid, stuck-up, misguided lump of puppyfat! Don't you worry! We'll settle your hash in no time! Yes –

HOMI: (coldly) You heard what the thing said. One hour. It takes one hour for us to deliver our weapons to their side. That means it takes them one hour too. That means, if they had the same bright idea that we did, then even as we speak, their planes are streaking towards us. (consults his watch) That means we have fifty-seven minutes before we know if their referendum was timed exactly in phase with ours.

BOO: (consulting her watch) Fifty-six.

DAX: (consulting his pager) Fifty-five point five.

HOMI: (smiling slightly) Fifty-five...

JEET: You're all mad! Mad as hatters! We've won, I tell you! WON! There'll be peace on the subcontinent at last! No Members of Another Community within fifty yards of any horizon! Overnight, even the miserable specimens who should have left for their homeland across the border when they had the option will be forced to recognize the error of their ways, yes! And they will bow their heads in shame before our gods! And crawl away into oblivion, yes – because, what else can they do, when we don't accept converts? And at last we will be one nation! Forever and ever, AMEN!!!

[From outside, a faint drone]

RANU: Shh! What's that?

HOMI: (no longer smiling) Aircraft. Fighters.

DAX: (hushed voice) Oh... shoot. Planet reformat.

HOMI: (to JEET:) So it seems you were wrong after all.

JEET: I don't care! I don't care if we all go up in smoke! I don't care, yes, even if I lose my children! They seem to have become worthless shits – and the world won't miss them! At least we weren't cowards! At least we didn't lose nerve in the face of a challenge! We showed the world what we could do – and now we've done it! Let the world tremble in fear! Let them mess their pants!

HOMI: If there's anyone left.

RANU: You thought we'd be destroyed as soon as the counter reached the fifty-mark. But we're still here. So you were wrong about that. You might be wrong about everything else too.

[The drone is louder]

BOO: (turning to her brother) Do you believe in heaven, Dax?

DAX: Yeah. Maybe. Depends.

[The drone is louder still]

JEET: You're all pampered, cotton-witted, pumpkins! Nothing's going to change, you'll see! These are just our own jets, flying overhead on their way to deliver the bombs!

BOO: See you there then? (she holds out her hand to him)

DAX: (takes her hand fondly) Yeah. It'll be cool.

JEET: And when it's all over and we can all look back on this shameful episode, you'll be GLAD you were Indian! You'll be GLAD you came back to your motherland! You'll be GLAD you belong to a forceful, virile nation! You'll be GLA –

[Total blackout]

# Comment:

## Duodecennial

MANY moons ago I sat near the Bodhi tree at Bodhgaya and watched over a lakh Himalayan Buddhists quietly mumble through labour pangs of enlightenment. Some were circumambulating, chanting their *mantras*, rosaries slipping fast through their fingers and prayer wheels rumbling with infinite patience. Others clanged cymbals whose notes either pierced one's ears or shook one's bones. Thousands of monks and laity from the four directions prostrated with gymnastic fury to the Buddhas of the four quarters. Thousands of butter lamps and clutches of incense smoked out the base of the temple. The spire which rose out of smoke and

light seemed like a rocket, fuelled by devotion, about to take off.

Away from the temple the kids played, men drank and gambled, women slogged at their daily grind. They were there to participate in a ten day initiation ceremony presided over by the Dalai Lama. The deity whose blessings, power and knowledge they sought was *Kalachakra*, the Wheel of Time. Near the Bodhi tree, presumably where Gautama, a prince of the Sakya clan was enlightened, a carved image in stone of the Starving Buddha watched his devotees shuffle past. Gautama Buddha, the Compassionate, successor to

Rama in the Vishnu *avatar* cycle must have felt pleased. Four moons later, which legend tells us is the moon under which the Buddha was born, reached enlightenment and gained immortality, he was certainly not smiling. The wheels of time were rolling. This was January 1974.

On the full moon of May 1974, one year before Indira Gandhi, a woman besieged by her own hallucinations, decided to castrate India, the Government of India conducted its first fatal affair in Pokhran. Then as now, two duodecennial cycles later, there was orgiastic jubilation. Ours was a nation which would stand up and be noticed, a nation whose potency no one could doubt, a nation which would flaunt its credentials to its bigger neighbour. 'Remember one duodecennial cycle ago when you humiliated us with the size and might of your guns, never again.' The frenzied prime minister of India expected the nation to want more, more of the same delight, more of the same willingness to go out and conquer. But the nation had other ideas; banal thoughts of *roti, kapda aur makan*, and the right to exercise its democratic prerogative. It was time for the angry young man to erupt.

The legend of Amitabh Bacchan began with the release of *Zanjeer* in 1974. The hero spoke little, sang no songs, and with celluloid ease Inspector Vijay dispensed justice as his Muslim brother in arms, Pran, sang, *Yari hai iman mera/ yar meri zindagi/ Pyar ho bando se ye/ Sabse badi hai bandagi*. A brooding Vijay is haunted by a recurring nightmare, a white charger galloping with menace towards him. The menacing nightmare of a horse is an unashamed inspiration from the film *Death Rides a Horse* with that arch baddie Lee Van Cleef. The white horse as a symbol of Armageddon is of course nothing original, specially in the Hindu psyche; Kalki, the tenth avatar, successor to the Buddha, rides a white horse and with celestial lightening and thunder he brings down the curtain on *Kali Yuga*, and with that annihilates the curse of Time. There is no tomorrow.

There was an elegant angry man, relatively young then, whose rage was not dampened by the thought of The Day After; a man who put to sleep Madame G's euphoria, and that too only a month after her little bomb. He was not over forty years old and so one trusted him. His oratory was incendiary, his charisma virile, and like Inspector Vijay he had little patience for bureaucracy. He was a man on the fast track.

It seemed at the time as if everyone wanted to run faster than they could walk. The Left, which was more red then, the Right, which was less saffron, and even

those who were ideology-free like the ruling hawks were in a hurry to reach political *nirvana*. They all had one common love, the bomb. The Left loved it because their fraternal comrades had a few lying around. The Right because it was a symbol of patriotic prowess, and the ideology-free for the simple reason that to have one is better than not to. The angry young man of virile disposition was magnificent, spouting pink rhetoric, a pacifist who loved to bomb. In April '74 he was busy shunting forces across the country. He was the tiger (skt. *vyaghra*) who roared in the face of Durga.

In the same month, millions had gathered at Hardwar for the *Mahakumbha mela*. They came from all corners of India seeking salvation, bearing tales of local discontent, uprisings, and repression. The naked listened to the clothed. The enlightened sighed gravely to the idiot savant. Things were truly miserable, *kumbhapunya* notwithstanding. There is a theory that in times of depression a person sublimates his/her sexual energy and mutates love, sensitivity and joy into hate, callousness, and self-obsession... the Inspector Vijay syndrome.

All these qualities are, of course, glossed over with the sheen of patriotism and the rhetoric of progress and change. A near perfect model for this in 1974 was the angry young Sanjay Gandhi who, protected by his mother's veil, ran rampant through the dank corridors of power with half-cocked notions for a nation's salvation. At the *Kumbha* the naked ones were not impressed with Sanjay's posturings, certainly not by a portly Babaji called Avidyanath, who was far too preoccupied with internecine warfare in the Nath sect. His Gorakhpur *math* had become a den for criminal activities and the politicians of change, in his case the Jan Sangh, were demanding accountability. His angst, however, was not shared by the babajis who sat round the *dhunis*. They smoked their way to glory and forgetfulness; a *brahmachari's* lot is not an easy one.

Mahant Avidyanath has come a long way since then, both in his rotund dimensions, his wealth, and his preoccupations. The man, even though he is called a saint, is preoccupied not with the yogic tradition of Goraknath, but with a spire in Ayodhya; the celibate in search of a *parivar*. At the *Kumbha mela* in Hardwar in 1998, I was witness to a congregation where *asuraic* chill crept into one's marrow. It was a closed door affair, with only members of the sect present. Fascists always sound reasonable. Simplistic arguments are persuasive because they only address insecurities and offer instant solutions. 'Till we rid the nation of the alien

religion of Islam the Hindus will never be free. Kill a Muslim if you have to, it is not a sin. We have a government today that will protect you. I guarantee you that,' the fat 'saint' croaked while the lumpens in their garb of the ascetic listened.

Today, there is more money than Kuber can dream of in the temple and *sadhu* coffers, and it is difficult for a babaji with ambitions to marble his ashram to raise a voice of yogic dissent. Under the two acre tents on the left bank of the Ganga, at Hardwar, in hushed pious tones the mendicants in silk robes harangued the faithful to build a temple of mortar and stones. There is a homilie in the *tantras* which says that one is a worshipper of Shakti, the primal force of creation, within oneself, with Shiva as the vision, bearing the calm and peaceful countenance of a Vaishnava.

At the 1998 Kumbha a Naga baba of unfamiliar antecedents took it upon himself to build a temple on a small and shifting sand bank facing the grandest *haveli* on the waterfront. The sparkling white three storey mansion, with its own private *ghat*, was built by Sriman Rai Bahadur Das Jugal Kishore Birla Pilaniwala as a *dharamsala* in the thirties. Today, it is the spiritual retreat of the Khaitan family which bases itself in Calcutta, Jhunjhunu and Mumbai. It mostly lies empty, but not neglected. The family retainers clean and polish the cavernous halls of marble and teak. The thousand volumes in an eclectic library are stacked behind glass-fronted bookshelves. A portrait of The French Mother of Pondicherry looks sternly down at the works of Romain Rolland, John Le Carre, Jackie Collins, Enid Blyton and, of course, Sri Aurobindo.

There is an apocryphal story that an elder of the Birla clan was told by a soothsayer decades ago that as long as the family had a temple in construction its fortunes would never sink. For three days I watched the baba, naked with his matted locks carelessly flying in the breeze, build the temple with boulders dug out from the riverbed, piled on top of each other to form a four foot high Mount Kailash. With the placing of each boulder he would dance the jig of a madman howling to an invisible god. On the day of the Mahakumbha, 14th of April, the babaji consecrated his temple, sought Shiva's blessing and left the temple in the hands of the melting snows of the Himalaya.

For the angry young man of virile disposition from 1974 the wheels of time have turned. Not only has he aged, we all do, but his politics has taken on ancient hues, a medieval mind that seeks revenge for the failings of one's ancestors, a mind that views power as patriotism, the mind of an ageing Inspector Vijay.

When on the full moon in May this year he and his band of post Viagra politicians detonated the bomb, they, with one turn of the wheel, brought every human being in the subcontinent closer to a collective death; our individual destinies disregarded for the greater good of what I am not sure. Perhaps Inspector Vijay who has now graduated to a grey *Major Saab* has an answer. Alas no. His career has bombed and all he can sing is, 'A Punjabi lass has stolen my heart. A cracker of a Punjabi girl. I feel great.' There is probably many a Punjabi girl in Lahore wistfully cooing to the latest avatar of Amitabh, the postman from Mirinda, 'May your strong blow gently caress my soul.'

The vyaghra is a potent symbol, not only in this country, but across the world. The vyaghra has sold Esso Oil, an up-country tooth powder, a Chinese underwear brand, an American baseball kit firm and of course, the famous balm from Singapore. This animal, whose innards, penis, anus, tooth and nail keeps the Chinese nation on its horns is poached and sold to middle Indian traders, the same lot that roars patriotism at the drop of a *topi*. They are in keeping with our hoary tradition. Shivji sits on a vyaghra's hide, Durga rides her mount, a vyaghra, and taxis and hovels in Bombay have leaping vyaghra's flying out of their windows. The Royal Bengal vyaghra, an endangered species, is rarely seen in the mangrove swamps of the Enchanted Forest today, and yet is the most prolific maneater.

The angry old man, once young and of virile disposition, today spouts mushrooms of vyaghra rhetoric while the Royal Bengal vyaghra's who roamed with the bears in the '70s now meow pacifism. Two duodecennials later the wheel of time has turned many times round. We are a subcontinent, divided by an imperial conspiracy, hell-bent on annihilating ourselves to overcome our impotency. To quote, and very partly translate, a sage-like Englishman, if only for the sake of irony, William Blake's 'The Tiger':

Vyaghra! Vyaghra! burning bright  
In the forests of the night,  
What immortal hand or eye  
Could frame thy symmetry

When the stars threw down their spears,  
And watered heaven with their tears,  
Did he smile his work to see?  
Did he who made the Lamb make thee?

**UNDERWORLD** by Don DeLillo, Picador, London, 1998.

THE Concise Oxford Dictionary defines 'epic' as 'an imaginative work of any form, embodying a nation's conception of its past history,' and in this sense Don DeLillo's *Underworld* is a true American epic. It is a monumental novel, not simply for the time span it covers – from 1951 to 1992 – but because DeLillo, perhaps more skillfully than any other living writer, gives us a sense of not size itself but size's relativity: scale. The slippery conjunction of minutiae of ordinary lives – the 'frail bundle of soma and psyche' which we are – and the almost inconceivable vastness of things which give History its capital 'H': the atomic bomb, the Cuban missile crisis, the dynamics of global capital, AIDS, the production and destruction of waste, environmental pollution – and those words which no longer connote places but events – Vietnam, Chernobyl, Hiroshima, to which dark list we can now add 'Pokhran'.

The other definition of 'epic', which concerns the grand deeds of legendary figures, is as far from the book as it's possible to get, for though DeLillo's is peppered with real historical figures – from Frank Sinatra and J. Edgar Hoover to a staggeringly vivid rendition of stand-up comedian Lenny Bruce, hell's court jester – none are spared the same, surgically precise delineation

of their thoughts, gestures, kinks of character, quirks of speech as the 'ordinary' or non-famous characters who teem through these pages. As Paul Quinn writes, 'No one currently writing has peripheral vision more penetrating than DeLillo's.'

It's well-nigh impossible to paraphrase DeLillo. The way he writes dialogue concedes nothing to 'good literary style'. Instead, he notes and jots, skips and forgets, meanders and interrupts. The impression is that we are not reading but overhearing the accidental, amateurish reality of people's lived lives: imperfect, unplanned, all too human, but not without their moments of wayside grandeur, bravery, loves and loss.

DeLillo launches his narrative on 3 October 1951, the day that the Giants and the Dodgers played a historic game of baseball in New York City. Also, the day that Russia exploded its first nuclear bomb triggering the start of the Cold War. The ball which was hit into the stands to win the match is caught by a young, black kid, Cotter Martin. From the time it leaves his hands that same night, we follow its elusive trail from person to person, down the years. It is finally tracked down by Marvin Lundy, a tireless collector of baseball memorabilia, after 22 years of painstaking searching. Lundy, whose own memory for words is slowly slipping away, has his own theory as to why such an important baseball match was so inexplicably badly attended:

“...Because certain events have a quality of unconscious fear. I believe in my heart that people sensed some catastrophe in the air. Not who would win or lose the game. Some awful force that would obliterate—what’s the word?”

“Obliterate.”

“Obliterate. That would obliterate the whole thing of the game...”

“In other words.”

“In other words there was a hidden mentality of let’s stay at home. Because a threat was hanging in the air.”

“And you’re saying people had an intuition about this particular day.”

“It’s like they knew. They sensed there was a connection between this game and some staggering event that might take place on the other side of the world.”

He also points out that the core of the nuclear bomb is the exact dimensions of a baseball. Both things seem coincidental to a rational mind, and yet, like Brian Glassic to whom Lundy’s explains his unlikely theories, the reader is also caught believing it to be ‘lyrically true... unprovably true, remotely and inadmissably true but not completely unhistorical, not without some nuance of authentic inner narrative.’

It boils down to this: ‘Everything is connected in the end.’ This may, or may not be logical, but it rings lyrically true, and *Underworld* is in many ways the statement’s authentic inner narrative. It is, in part, the suspicion that a butterfly landing in England causing a building to collapse in China is not a piece of philosophical whimsy, but a provable fact: an aerosol sprayed at a Californian armpit chips another few millimetres from the ozone layer, and an extra drip of melt water drops from the tip of an Antarctic iceberg.

The central character in the book, if indeed it can be said to have one, is Nick Shay, a waste management executive, for whom waste disposal is not just a job—it is a calling, a philosophy, an index for understanding the world in which we live:

‘We were... waste giants, we processed universal waste. Waste has a solemn aura now, an aspect of untouchability. White containers of plutonium waste with yellow caution tags. Handle carefully. Even the lowest household trash is closely observed. People look at their garbage differently now, seeing every bottle and crushed carton in a planetary context.’

The problem of nuclear power, as DeLillo forcefully reminds us, is not just that it results in bombs

capable of terrifying devastation, but that the waste generated is just as deadly. It is perhaps no coincidence that the deity from whom plutonium gets its name, was the god of the dead and ruler of the underworld.

In the light of the nuclear tests in the Rajasthan desert, the events described in *Underworld* have an eerie resonance. Klara Sax, a world-famous artist and one-time lover of Nick’s, is working on a massive project—the installation and painting of 230 B-52 long-range bombers in the Arizona desert. When asked why she chose the desert setting, she replies, ‘It’s only logical of course. And it enables us to show our mastery. The desert bears the visible signs of all the detonations we set off. All the craters and the warning signs and no-go areas and burial markers, the sites where debris is buried.’ The images hit even closer to home when Matt Shay, Nick’s younger brother, explains to his girlfriend: ‘Go to the desert or tundra and wait for the visionary flash of light, the critical mass that will call down the Hindu heavens, Kālī and Shiva and all the grimacing lesser gods.’ Is it entirely unconnected that Oppenheimer and Teller used to quote Hindu scriptures to each other as they set about harnessing this divine/demonic power? ‘They are everywhere at the same time, endlessly connected, and you half believe the most implausible things because you’d be stupid not to.’

The ‘curious connection’ between weapons and waste comes to a head when Nick and his colleague Brian Glassic visit a test site in Kazakhstan where Viktor Maltsev, another waste disposal expert, offers them a chilling solution to the ever-increasing problem of waste:

‘He (Viktor) says waste is the devil twin. Because waste is the secret history, the underhistory, the way archaeologists dig out the history of early cultures, every sort of bone heap and broken tool, literally from the ground.

All those decades, he says, when we thought about weapons all the time and never thought about the dark multiplying by-product.

... That’s why we have this idea. Kill the devil. And he smiles from his steeple perch. The fusion of two streams of history, weapons and waste. We destroy contaminated nuclear waste by means of nuclear explosions.’

The connections drawn by DeLillo are not the cause-and-effect ones of Newtonian physics, but are subtle, multivalent, nuanced and supra-logical, more in keeping with this age of quantum mechanics and chaos theory. They turn on the slightest gesture, as

infectious as a yawn. As Nick Shay smears lotion on his arms, driving toward Klara Sax's extraordinary desert artwork, he recalls, gesturally, the almost touching naiveté of Edward Teller applying sun-block before watching the first nuclear detonation. In the 'Museum of the Misshapens' in Moscow, deformed foetuses are preserved in Heinz pickle jars – in a vision straight out of Breugel – and the children of the 'down-winders', the human fall-out of radiation sickness, play the same games of 'it' and 'tag' as the children in the Bronx of Nick's (and DeLillo's) own childhood.

"Do you believe it was intentional?" he asks Viktor, surveying their terrible twisted limbs.

"I believe everything. Everything is true. Every time they did a test, hundreds of towns and villages exposed to radiation. Ministry of Health says, Okay we raise limit again. When limit is passed, Okay we raise again. ... Once they imagine the bomb, write down equations, they see it's possible to build, they build, they test in the American desert, they drop on the Japanese, but once they imagine in the beginning, it makes everything true," he says. "Nothing you can believe is not coming true."

Nick's hope that somehow this might be 'intentional' that, in the end, there may be someone to blame, is understandable, and all too human. God, the State, the Enemy – something to suggest that behind this systemic chaos, this microcosmically interlinked splatter of energies which we sort retrospectively to make history, to make sense – there is a will, an intention.

There is an almost touching nostalgia for the bygone days of Cold War enmity, where They were Them and We were Us and the lines between were clear. Matt, who works for a weapons programme of such sophistication that its operations are hidden even from itself, recalls the bomb drills hammered into them at school by the fierce Sister Edgar with a powerful and sad longing for simpler responses and threats you could point to. Though pitifully inadequate, absurd and even surreal, the instructions as to what to do in the event of a nuclear attack – Cover Your Mouth, Don't Touch Things – brought with them a sense of security and belonging: there were, at least, rules which meant that someone was in charge, someone knew what was going on.

When the Cold War thaws, your enemies no longer have faces. Fear goes underground. In the age of the Internet, the place of conspiracy theory is taken by paranoia. Paranoia becomes not a pathological state but the norm, coincidence takes on the force of logic.

It is what happens when Forster's injunction 'Only connect' meets the late 20th century: global capital, the mass transportation of waste, the nuclear threat, mass media events, the spread of AIDS, the network of networks – you end up with DeLillo's underworld of 'only connections'.

The connections are so deep that they defy logic, and twist on faith. Down on the mean streets of the Bronx, a young girl is raped and murdered. When her image appears to glow from a neon advertising board every time a train goes lumbering by, thousands gather in a spontaneous gesture of faith: a latter day Lourdes in the heart of the city. For all its bleakness, the book is not without its moments of hope, nor of humour – though both appear hard-won, and perhaps all the more precious for that.

In *Underworld*, the globalization of capital and its 'evil twin', the problem of waste, are illuminated by DeLillo's spare and lyrical prose for what they actually are: a single Janus-faced god in a world where the old gods have failed.

Like that other American-epic of paranoia, Thomas Pynchon's *Gravity's Rainbow*, whose incendiary narrative explodes around the V2 bombs manufactured in Peenemünde by Nazi Germany, DeLillo's *Underworld* also spirals around bombs – and those not necessarily fired at targets, but exploded underground, whose shock waves rock the very foundations of our earth, and whose sinister half-lives condemn generations to come with their own shadowy, misshapen existence. With his unerringly deft delineation of weapons, waste and the end-of-millennium mushrooming of new forms of religious belief, ritualism and the quest for power on heaven and earth, one wonders what DeLillo would have made of the vision of Hindutva evangelists sprinkling the untouchable, contaminated radioactive dust of Pokhran across our corner of the globe.

Anita Roy

**BLACK RAIN** by Masuji Ibuse (tr. John Bester).  
Kodansha International, Tokyo, 1969.

THE Second World War ended on a crescendo of violence. It showed that the annihilating power of the nuclear bomb could wipe out the entire human race. To protest against such acts of destruction, Masuji Ibuse took twenty years to write *Black Rain*. One of the most powerful novels on the nuclear explosion in Hiroshima and its aftermath, it tells the world of the

potential capacity of groups of human beings to destroy each other. The novel has multifarious strands. Japan, its imperial aspirations and World War II, Hiroshima and the atom bomb, the ancient Japanese customs and the Japanese countryside, the everyday preoccupations of the Japanese people: these are the major and minor chords struck fortissimo or pianissimo, sometimes brought together in discordance but without diminishing the main theme in any way. The dominant theme, always present either in the background or foreground, is one of human destruction, of desolation so utterly foreign to human comprehension that the human eye has to record each little detail of the initial incomprehension of the enormity of the scale of devastation, just to keep asking – ‘What was it that had the power to cause all this?’

Ibuse’s eye has captured the details of immediate, senseless death and suffering, and the lingering deaths brought on by radioactivity. He occasionally peers through the diary of a marriageable young girl, Yasuko; he reads the diary of her uncle, Shigematsu Shizuma and the correspondence between Shigematsu and Dr. Iwatake. He glances at the housekeeping accounts and the basic menu of wartime Japan her aunt Shigoko, kept as a careful housekeeper. It reads like a document of real life, in fact it is more like a documentary in places. Shigematsu and Dr. Iwatake’s experience of the bombing was as real as their records of it and of Japan during the war. *Black Rain* therefore subtly weaves fiction and actual records in polyphonic narratives, all speaking in different keys, each one of them distinct and audible to anyone who cares to listen.

Ibuse tracks his characters down to Kobatake, a village hundred miles to the east of Hiroshima, four and a half years after the nuclear explosion, records Shigematsu’s concern for the non-existent matrimonial prospects of his niece as rumour whispered of the possibility of Yasuko carrying ‘radiation sickness’, and then leaves them to do their own talking. The narratives shift from mundane, everyday occupations, human expectations in wartime situations, to the moment of the ‘terrible flash of bluish-white light’ accompanied by a ‘roar of sound’ outside, that was to change, maim or kill hundreds and thousands of lives. Graceful social gatherings like the tea ceremony carrying all the weight of centuries of tradition, polite conversation on train decks, all grind to a halt.

Yasuko’s concern for a small flower clinging to the rock against which she has taken shelter does not stop her from pressing against it harder. Shigematsu

uncharacteristically finds himself yelling as bodies crush against him as pandemonium breaks out in the suddenly stationary train and the crowd begins to spill into the railway station. A society inured to air-raid shelters, routine radio broadcasts, suddenly paused. It sensed that this time it was different, maybe it was a poison-bomb, a new type of oil bomb, but whatever it was, it was deadly. With it a flaky white powder and black rain that would not wash off descended from the sky. A many-hued, monstrous mushroom cloud with a long twisted stalk sprouted high over Hiroshima and hovered there, ominous and threatening. Human beings suddenly developed extensive burns that stripped the skin off, also oozing lacerations and wounds that did not hurt. Automaton-like human beings with vacant faces wandered around pointlessly’.

There is no space for sentimentality in the descriptions of human suffering. At the surface, the accounts are purely descriptive, flat, an attempt to understand a phenomenon that blasted buildings, houses, thousand-year-old camphor trees and reduced the entire city to a sea of charcoal and rubble. What could turn tin-roofing into unrecognizable, round, metallic dumplings, and hurl tiles and pieces of burning timber from the houses like so many lethal projectiles through the air? What could make a charred fragment of sheet music, after having ‘roamed the void for a whole day and night,’ come fluttering down from the skies? Ironically and eerily the lyrical words extolling the cherry blossom – ‘cherry blossom, cherry blossom in the spring’ – on the fragment might remind one of a 17th century Japanese poet, Basho and of peace:

Under the cherry  
Flower guards have assembled  
To chatter  
Their hoary heads together.

Descriptions of death descending unaware on a city humming with military activities, domestic and business pursuits, are sharp like a surgeon’s knife, as vivid as a skillfully wielded paintbrush. The piled-up bodies of dead school children looking like ‘beds of tulip’ from afar and like ‘the layers of petals on a chrysanthemum’ from up close, bodies charred black, bodies lying in grotesque positions, bodies of young women clasping dead infants, bodies piled six feet high in a destroyed temple site now being used as a ‘Reception Centre for Corpses’, and a sheet of flies and stench over all. Dead bodies floating in rivers mocking life by imitating the movements of life induced by the current in the river, pulsing streams of maggots pouring over the cheeks, eyes and mouth giving an impression

of life and movement in a dead body. Death amidst a scene of 'unremitting desolation' as far as eyes could see.

The human mind, buffeted by the macabre and gruesome visions of death, could only revolt at childhood memories of poems applauding the brave deeds of worms – 'Oh worm, friend worm! Rend the heavens, burn the earth, and let men die. A brave and noble sight.' In 'a hell that is tortured with omnipresent, inescapable odour,' human anger could only rail at the memory of poems learnt in childhood obscenely reveling in death and putrefaction in poetic flights of fancy. With the fantasy turning real in his adulthood, when he saw the worms in action, Shigematsu could only say, 'Revolted man!'

Yet these flashes of anger directed 'at no one in particular' come only at rare moments in the narrative. The absorption with and the exactitude of the details of 6 August 1945 remain understated, emotionless and at the same time stark, successfully conveying the day as a human catastrophe of immense magnitude. The everyday similes, gentle, occasionally humorous, welling from minds that had never confronted destruction and death in such dimensions, oddly weld together the gruesome and the everyday lives with familiar images and comforting sounds. A wife in search of her husband, confronted with unrecognizable faces and unidentifiable voices moaning in unison in pain, was irresistibly reminded of 'a chorus of frogs starting up in a paddy field.' Trained nurses and army lieutenants, loudly professing to do things army-fashion, threw science and rules to the winds and treated burn wounds with cucumber juice, an old wives' remedy, instead of using 'Ringer's solution, glucose, salt-solution or something similar.'

The sadness of a disintegrating society that had been at war too long, where all the established norms of behaviour had been destroyed by the war – inconsiderateness, rudeness of army officials in public places, lack of respect for the dead – all coalesced to show up the war for what it was, a colossal waste of men and morals. The waste, never explicitly stated, was not just in the profusion of dead bodies, but in the manner in which food, a precious necessity in a rationed war economy, spilled out, tumbled out in the dirt, proclaiming wanton waste. As frugal people, they were appalled at the waste, used it to ruminate on the futility of war, used it unconsciously as a cultural statement. Like the cooking-rice pot by Shigoko's side as she sat waiting for her husband in the ruins of Hiroshima. Like the spare conversation refusing to indulge in effusion

when confronted with the return of dear relatives long given up for dead. Emotions held tightly reined in, unclouded by theoretical clap-trap, allow the reader to observe the moral and physical outrage on humanity better.

That even such memories and empathy of observers of the victims caught in the raid grow dim after the passage of four and a half years is noted and registered in a life-affirming, philosophical statement that nothing stays still, life moves on, leaving the more unfortunate behind. The shock, the chill that gripped the Japanese people at the display of instant destruction – like a visible giant hand crushing people like ants leaving a slow death for many survivors in its wake – 'radiation sickness' – could also fade in a mere four and a half years. It was therefore perhaps inevitable that the sedentary lifestyle of the victims of radiation would catch the unfavourable attention of the villagers during the busiest part of the year – harvest time. In a confrontation between the 'lucky' radiation victims unable to justify their existence in the hard physical rhythm harvesting time demanded, and an outspoken widow who openly accused them of malingering, 'the normally mild and gentlemanly' Shokichi said angrily:

The people have forgotten that Hiroshima and Nagasaki were atom-bombed. Everybody's forgotten! Forgotten the hell-fires we went through that day – forgotten them and everything else, with their damned anti-bomb rallies. It makes me sick, all the prancing and shouting they do about it (pp. 29-30).

It is both a protest and a comment on the fleeting memory of the world that could forget such a bitter lesson learnt at a great cost. Shokichi had pronounced the epitaph that can be applied to the world we live in today.

**Anindita Mukhopadhyay**

**MAINTAINING NUCLEAR STABILITY IN SOUTH ASIA** by Neil Joeck. Adelphi Paper 312; Oxford University Press, New York 1997.

**STABILITY IN SOUTH ASIA** by Ashley J. Tellis. RAND Documented Briefing, Arroyo Center, 1997.

MAY 1998 marks a critical moment in the nuclear history of the subcontinent. India and Pakistan renounced their hitherto held positions of strategic ambiguity and made the transition to being declared nuclear weapon states. A crucial question which assumes salience in the light of these developments

relates to the implications of the overt nuclearisation of the subcontinent and more specifically what this entails in terms of regional stability.

Two recent monographs seek to directly address this issue. Although these were written prior to the nuclear tests conducted in India and Pakistan, they were premised on the fact of existential nuclear deterrence in the subcontinent and the recognition of developments (on both sides) in the delivery and deployment technologies associated with these weapons of mass destruction. Since both authors have divergent assessments of the prospect of stability in South Asia, they provide us with the contours of the debate taking place outside the country. They also find echoes within the subcontinent among different domestic constituencies.

A couple of basic assumptions undergird Neil Joeck's appraisal of the prospects of nuclear stability in South Asia. First, there is a recognition of the unlikelihood of nuclear rollback in the near future and second, the development of delivery vehicles (like the short range ballistic missiles) as an important element of the ongoing nuclearisation of the subcontinent. The broad argument the author seeks to make in his work is that nuclear weapons do not contribute to stability in the region and, further, do not eliminate the possibility of nuclear war in a nuclearised environment. Nuclear weapons, he argues, fail to reverse the tide of historical animosity between India and Pakistan and do not explain the absence of a major war in the subcontinent since 1971.

The hypothesis of nuclear instability is further vindicated in the author's assessment by empirical evidence stemming from the Operation Brasstacks crisis in 1987. Scenarios of 'inadvertent escalation', 'misperception' of conflicting parties and an inability to control the 'pace' of crisis – all seek to suggest that nuclear weapon use in war cannot be ruled out. Another factor which Neil Joeck believes will further complicate the situation is the nature of domestic politics in the region. Although the author concedes that India is not likely to be the initial aggressor, as it is perceived to be domestically stable, the same confidence is not expressed in his assessment about Pakistan. He argues that a *pot pourri* of Mohajir Qaumi Movement (MQM) tensions, Sunni-Shia conflict and the Taliban crisis could be potentially destabilising, enhancing the prospect of war in South Asia.

Although none of these scenarios are regarded as 'pre-mediated', Neil Joeck rejects the claim of a natural stability in South Asia emanating from a minimal deterrence in the region. The logical pursuit of the

argument leads him to provide prescriptions which in his view would enhance stability in the region and minimise the risk of nuclear use. The issues of command and control are an important element of this inventory of nuclear management and would involve a series of measures. These could range from decoupling of nuclear warheads with delivery vehicles, storage of nuclear material in diverse sites to prevent unauthorised seizure, and setting up of mechanisms such as the permissive action links to minimise nuclear risk. However, this would only be a part of the package and would have to be complemented by diplomatic efforts. These efforts, the author concedes, have borne results in the past, which is reflected, for instance, in the agreement arrived at by India and Pakistan not to attack each other's nuclear facilities.

Another element which engages Joeck's attention relates to the relationship between conventional forces and nuclear weapons. The line of argument offered is that conventional forces would need to be in a state of preparedness to prevent any asymmetry which prompts a re-evaluation among conflicting parties and prompts escalation. In other words, the argument is that conventional deterrence must underpin nuclear deterrence in order to diminish the prospect of nuclear use.

Neil Joeck's scepticism about the prospects of strategic stability in South Asia is in marked contrast to Ashley Tellis' forecast of a period (10 years or more) of 'ugly stability'. The term 'ugly' is used to convey the pattern of continuous low intensity conflict which prevails in Kashmir. The principal finding of continuing stability in South Asia is explained by a variety of reasons, but at the outset a few comments are in place. Unlike Neil Joeck's monograph, which concentrated its research energies on the question of 'nuclear stability' in South Asia, this volume deals with nuclear stability as part of the broader matrix of emerging political equations in the region as well as in 'Greater Asia', which includes China.

The author's endorsement of short term regional stability in South Asia is based on an appreciation of the political objectives of India and Pakistan in the region and an unwillingness to secure these objectives through a full-fledged conventional war. India, the author argues, seeks a larger psychological goal of great power status within the Greater Asia region (Which included China). Pakistan in marked contrast seeks to resist any such move which it interprets as affirming the Indian quest for great power status in the region and the world. Militarily, Tellis recognises

India's security objectives as primarily those of deterring China and prevailing over Pakistan in case of a conventional conflict. Pakistan's military objectives are directed at retaining its territorial integrity and attempting to secure the 'disputed' territory in Kashmir.

Despite these political and military objectives, India and Pakistan are unlikely to get into a conventional war in the next decade, primarily because the costs of war to achieve these political and military objectives make war an undesirable instrument for a resolution of the disputes between the two states. Tellis distinguishes between different war objectives and the implications these hold for the region. A war of unlimited aims (which is aimed at the total destruction of a conflicting state) is improbable because India does not have the political incentives to go in for such a war, while Pakistan does not possess the wherewithal to undertake such an exercise. Similarly, Tellis argues that a war of limited aims is also unlikely because of a 'structural' inability of both India and Pakistan to control the duration of war. Therefore, the only form of conflict which is likely to persist in the region is one of low intensity conflict of the kind witnessed in Kashmir.

The author further anticipates a conflict between the aspirations of India and China for great power status and envisages future Sino-Indian conflict as a result. This is premised on the pace and success of India's economic reforms. However, the success of such a move could be offset, in the author's view, by a potential rise in Indo-Pak tensions as a result of revisionism in foreign policy goals in the Greater Asia region.

The correlation of nuclear weapons with stability in the subcontinent, in Tellis's consideration, is much more 'ambiguous' than is commonly stated. It is important to recognise that both authors affirm that nuclear deterrence is not an automatic system which falls in place. A careful re-consideration of the size of arsenals, command and control mechanisms, intelligence and warning systems, the articulation of nuclear doctrine and confidence building measures (CBMs) would be crucial to the nuclear stability of the region.

Both monographs represent preliminary efforts to map the transition from a state of non-weaponised deterrence to a position of weaponised deterrence and a prognosis of what this entails for the region. There are a series of complex issues involving the actual practice of deterrence and there is quite clearly no infallible correlation between deterrence and stability. This remains as true of South Asia as of the practice of deterrence by the other declared nuclear weapons states. These works serve as a useful reminder of the

paradigmatic shift which occurred in the nuclear history of South Asia in May 1998, and underline the need to concentrate our collective energies on how best to minimize nuclear risk and avoid situations of unacceptable damage.

M. Siddharth

**THE FATE OF THE EARTH** by Jonathan Schell.  
Alfred A. Knopf, New York, 1982.

LIKE mumps and love, nuclear arms protest has become something that everyone influenced by the western ethos has to get once. It's a part of growing up, involving the cathartic rituals of demonstrations, banner waving and slogans. You get it out of your system and then get on with the more serious things of life. Of course, there are some who never seem to get over this phase, who keep harping on the dangers of nuclear conflict and the urgent need for disarmament, much to the embarrassment, irritation and eventual boredom of those around them. Such persons are generally considered cranks, rather like vegetarians, religious fanatics or people who write for a living. There is something unreal about them.

And the reality is that of course the Bomb is there, part of the backdrop of daily routine, a fact of life like inflation, income tax and the high cost of fuel, and any sharp stab of terror it once might have evoked has long dulled to the mild, reassuring ache of an old wound. Through repetition, the warnings and statistics have become meaningless incantations; nuclear war could end the world; there is the equivalent of three tons of TNT for every human being on this planet; the hands of the Doomsday Clock are only minutes away from midnight. So what else is new? In this epidemic of acedia the spirit of Dr Strangelove, manic archetype of mega-suicide, ranges unfettered in a world grown familiar with the tribal lore of 'nukes', 'overkill', 'the balance of terror' and MAD (Mutual Assured Destruction).

Schell's book is a brilliant, impassioned attempt to exorcise this blind demiurge of self-destruction that seems to have possessed us. The book is something of a phenomenon. It has become an overnight international bestseller, an apocalyptic Bible for a new generation of pacifists. Hailed as a modern-day messiah by his followers, denounced by detractors in the nuclear establishment as a dangerously woolly-headed idealist, the 39 year-old staff writer for *The New Yorker*

\* Reprinted from *The Sunday Observer*, 21-28 August 1982 with permission from the author.

magazine, in which his book first appeared as a serial, has become the central figure of a cult and a controversy.

The extent and intensity of the public chain-reaction is intriguing. Since the first atom bomb was exploded 37 years ago, many critics including Einstein and Bertrand Russell, have questioned the wisdom of unleashing the awesome power that lies trapped in the heart of matter and have warned against the catastrophic consequences that may result from nuclear confrontation. But in the context of the nuclear issue, no scientist or philosopher, no matter how eminent, has had the same impact as Schell. Part of this might be explained by the fact that public consciousness of living on an endangered planet has been heightened by, among other things, the ecological movement, religious and spiritual revivalism and the space programme which has given us, for the first time in history, a view of our common earth as an exquisite, vulnerable entity against the vast indifference of the cosmos.

Moreover, Schell's comparative youth not only makes it easier for him to communicate with readers born and brought up under the shadow of the mushroom cloud but also lends his work the tone of an intensely personal testimony of what it means to have always lived on the edge of the abyss. Though he has spent years researching his material, he is no scientific *eminence grise* surrounded by an aura of asepsis. Nor is he a wild-eyed prophet crying in a self-created wilderness of confused thinking and self-indulgent emotionalism. He is a person in our midst, a deeply thoughtful, profoundly concerned individual, aware that at any time not only could the world as we know it come to an end but that, in the ultimate non-event which nullifies all events and everything else, both past and future, the human race could vanish into extinction.

In the first part of the book 'A Republic Of Insects And Grass', Schell argues that with the invention of nuclear weapons, war has become obsolete since warfare has always been a means to achieve certain ends and in the event of a nuclear holocaust any and all desired goals for which conflict could be engaged in would be destroyed. In sketching a possible scenario for doomsday, he begins with a graphic description of what happened when a 12.5 kiloton fission bomb ('a merely tactical weapon' by today's standards) was dropped on Hiroshima on 6 August 1945 and which transformed 'a city of some 340,000 people into hell in a space of a few seconds.' The blast wave, the fires created by the thermal pulse, the deadly 'black rain' or the mushroom cloud and the radioactive fallout took

a toll of 130,000 people who were killed instantly or died within the next three months. Schell quotes eye-witness reports to evoke a nightmare or surreal horror; a child with a head like 'a boiled octopus', a girl of three trying to get her dead mother to drink water, a naked man holding his eyeball in his hand. Added to the physical destruction, was the psychic devastation of the survivors who had literally witnessed civilization disappear in a flash and who were left the legacy of unspeakable horror and the prospect of watching their future generations maimed and killed by radioactivity related diseases.

But 'what happened at Hiroshima was less than a millionth part of a holocaust at present levels of world nuclear armament.' Schell estimates that between them the two superpowers, America and the USSR, have a total of some 28,500 megatons of explosive power. This amounts to the equivalent of some 2,000,000 bombs of the type used on Hiroshima. Experts agree that this is more than sufficient not just to wipe out all human existence but to so disturb the entire ecosystem of the planet that gradually all life is wiped out and our world becomes, for all time to come, a sterile rock capable of sustaining nothing.

Schell argues that the oft-repeated thesis of a 'tactical' or 'limited nuclear war' is untenable for once the first strike takes place all barriers of restraint and reason would be shattered. He describes the probable effects of the dropping of a one megaton and 20 megaton bomb on New York City. 'If a 20 megaton bomb were air-burst over the Empire State Building at an altitude, the blast wave would (be)... 450 square miles... the zone of heavy damage... would be 1450 square miles.... The fireball would be about 4.5 miles in diameter.... People caught in the open 23 miles from ground zero... would be burned to death.... People hundreds of miles away who looked at the burst would be temporarily blinded and risk permanent eye injury.... The mushroom cloud would be 70 miles in diameter. New York city and its suburbs would be transformed into a lifeless, flat, scorched desert in a few seconds.'

After a while the cadences of this macabre poetry of annihilation become hypnotic, a chillingly apt metaphor for the deadly predicament they represent. Schell quotes an authority to prognosticate the effects on the USA of a strike of 10,000 megaton missiles, a conservative estimate for a pre-emptive strike. Blazing light would 'illumine large areas of the country as thousands of suns, each one brighter than the sun itself, blossomed over cities, suburbs and towns....

Tens of millions of people would go up in smoke. In 10 seconds the physical plan of the United States would be swept away like leaves in a gust of wind. The 600,000 square miles already scorched by the 40 or more calories of heat per centimetre square would be hit by blast waves of a minimum of 5 pounds per square inch, and... substantially the whole human construct in the United States... would be vaporized, blasted, or otherwise pulverized out of existence.' America would be eliminated 'not merely as a political entity but as a biological one', as radioactivity polluted the environment and the ozone layer in the northern hemisphere was depleted by 70 per cent, thus allowing lethal levels of ultraviolet radiation to scorch into extinction all but the most primitive forms of life, represented by insects and grass. In the global madness resulting, other nuclear countries would be likely to be drawn into a conflagration that consumed the world.

Of course the holocaust *may* not occur. But using an inversion of the Pascalian wager regarding the existence of God (if He doesn't exist, the one who wagers loses nothing, if He does exist one has an infinity to gain), Schell argues that considering the stakes, the absolute, irreversible eternity of loss, we, the living, have no moral right to gamble with even the remotest possibility of extinction which he calls 'the second death'. This is the most challenging part of the book and the core of Schell's thesis. In developing his philosophical and psychological argument, he ranges from St. Augustine to Kant, from Kafka to Freud. It is a courageous attempt to think of the 'unthinkable'. The inevitability of individual death is tempered by the consideration that though we must die, what Hannah Arendt called 'the common world' which we share with both past and future generations in a continuum, which gives measure, meaning and direction to human existence and redeems mortality from despair, lives on. We are inheritors of the past and trustees of the future. Extinction cancels past, present and future.

But who will suffer extinction? Not those who were living, for they would be dead. Not the unborn, for they would not be there. Extinction is like a Damocles sword hanging over an empty space. Even that is wrong, for in the emptiness of extinction there can be no metaphor to cast a shadow. We cannot even think of extinction as total emptiness, as emptiness connotes an absence and in extinction there can be no absence since there is no presence. In the face of extinction all categories of thought and feeling are nullified. 'It thus seems to be the nature of extinction to repel emotion and starve thought, and the mind...

descends into a kind of exhaustion and dejection,' says Schell and attributes public apathy to the nuclear peril to this enervation.

The closest we can come to an understanding of extinction is through the historical experience of genocide in which an entire race is sought to be exterminated. Analysing the aftermath of the Jewish Holocaust, Schell shows how it is only through bearing witness to the millions who died that the survivors of the death camps can hope to not only redeem their fact but also to reclaim their own human values which the machine of mass murder had attempted to destroy. Similarly, it is our failure to bear sufficient witness to future generations that has eroded our ethical norms and blurred our aesthetic perspectives: Lacking belief in a future which will justify our ideas and ideals, art becomes a purveying of transient fads and love is reduced to a spasm of momentary gratification. As our 'common world' withers, 'we grow indifferent to one another. We drift apart. We grow cold. We drowse our way to the end of the world...'

In the last, most controversial part of the book, Schell calls on the people, not political or military leaders or technocrats, but on ordinary, everyday people, everywhere, to shake off this suicidal torpor and work in concert towards the goal of salvation. Saying that it is neither 'radical' nor 'utopian' 'merely to want to go on living and to want one's descendants to be born,' he refutes the 'nuclear deterrence' theory, of mutual safety being born out of mutual terror, as being based on a fundamental logical subterfuge. In its simplest form, the theory is based on each power possessing a retaliatory capacity which in turn would prevent a first strike by its presence. Therefore, the sole stated purpose of nuclear arms is to prevent the use of nuclear arms.

But in the event of a first strike occurring in any case, due to a mistake, misunderstanding, technical failure or whatever, the retaliatory capacity, by definition, becomes useless. It can, of course, still be used out of motives of pure revenge. But such a revenge would end the human race and with it end all justifications and motives, including that of revenge. Being aware of this, could any leader sanely consider a retaliatory strike? Possibly or possibly not. But could not the possibility of the latter eventuality tempt an adventurist leadership into launching a first strike? The balance of terror, argues Schell, has the shape of a vicious circle.

In order to 'solve' the dilemma, various nuclear theorists have proposed strategies by which a first strike could be prevented by projecting an 'appearance of

irrational inexorable commitment', a 'rationality of irrationality', or even a 'doomsday machine' which would automatically blow the world up the moment a first strike was launched. Such, says Schell, is the 'logic' of the nuclear 'realists'.

But Schell's own suggested solution sounds at first no less incredible and preposterous. Nuclear disarmament, he feels, is not enough because though weapons can be dismantled, the knowledge of how to make them again cannot be and will always be a threat to the world. For the same reason, even total disarmament is not the answer. The only solution, according to Schell, lies in our realizing that man's usurpation of the power to destroy himself has rendered the concept of nationhood, for the sake of which all wars are waged, obsolete. He submits that unless we learn to view the world as an indivisible entity, both ecologically and politically, we may not have a world for very long. Beyond quoting Gandhi's gospel of love and non-violence and echoing Forster's slogan, 'Only connect!', Schell offers no prescriptions as to how this ideal remedy of a unified world is to be obtained. In a world riven by ideological, religious and racial conflict, deformed by appalling poverty on one hand and prodigal affluence on the other, Schell's panacea may smack of an innocuous nostrum not to be taken too seriously.

It could be argued that this is the most tenuous part of book. Yet, following the line of Schell's reasoning, there can be no other conclusion. For as he says, 'The alternative is to surrender ourselves to absolute and eternal darkness: a darkness in which no nation, no society, no ideology, no civilization will remain; in which never again will a child be born, in which never again will human beings appear on the earth, and there will be no one to remember that they ever did.'

The greatest strength of the book and, paradoxically, its hidden weakness, is Schell's passionate eloquence. His prose approaches a sombre lyricism which, for all its harrowing lucidity, seems to beguile the reader to the edge of the precipice it warns about. It is too early to tell whether the recent resurgence of nuclear arms protest in the west which has coincided with publication of this book, which in turn has helped inspire it, will take deeper, more purposeful root or, as in the past, it will subside as a seasonal disturbance, and whether it will be the fate of the earth that this remarkable work will become a fashionable conversational piece or, worse still, a prop for latter-day Hamlets intent on brooding on cosmic doom.

## THE WORLD OF THE 'UNTOUCHABLES'

Paraiyars of Tamil Nadu

**Robert Deliège**

This book is a very relevant study of untouchability in caste India. Originally published in French, it combines thorough scholarship with meticulous field work among the most Shudra (Untouchable) community within the caste hierarchy in India: the Paraiyars of Tamil Nadu.  
0 19 564230 9 1997 215 x 140 mm  
334 pp. Rs 495 A

## A CULTURAL HISTORY OF INDIA

**A.L. Basham (editor)**

This book presents a comprehensive survey of Indian culture, covering various aspects such as religion, philosophy, social organization, literature, art, architecture, music and science. Thirty scholars, from Britain, India, USA, Canada, Australia, New Zealand and Germany have contributed to this volume.  
0 19 563921 9 1997 215 x 14 0 mm 644 pp. Rs 395 IP

## CHAPTERS IN AN ANTHROPOGRAPHY OF VIOLENCE

Sri Lankans, Sinhals, and Tamils

**E. Valentine Daniel**

This book describes nationalist violence with the sensitivity of an anthropologist and the lyricism of a poet. It records the author's search for terms in which to speak of unspeakable pain and passion. The events described and discussed here pertain to a particular time, 1983, and people, Sri Lankans, Sinhals and Tamils.

# Communication

THE Medico Friend Circle (MFC) is an all India organisation of health professionals who have been actively involved in diverse issues of health over the last 25 years. At their mid-annual meeting in Sewagram they discussed the recent nuclear developments in India and Pakistan. They felt that the health aspects of these developments were as important as their political dimensions, but have hardly been debated in public. In protest against the nuclear tests in India and Pakistan, the MFC presents the following critique of the tests from a health perspective.

The nuclear explosions have violated our moral and ethical sense as health professionals. In all health systems the upholding of life is of highest professional value. Acts which threaten life are against the basic tenets of our profession. The exploding of nuclear bombs and efforts towards the development of weapons of mass annihilation are symbols of the most extreme violence by the state against people. We, therefore, oppose the nuclear explosions in principle and practice.

Is the bomb pro- or anti-health? We are living only 43 years after the bombings of Hiroshima and Nagasaki. Out of the combined populations of the two cities of six lakh, nearly two lakh died in the immediate aftermath of the bombings; children were born with increased birth defects; survivors continue to have increased rate of cancers; and genetic changes may be handed down for many generations to come.

In the last half century 305 nuclear accidents have already occurred, this alone resulting in 1871 cases of acute radiation syndrome and 101 deaths. Nuclear bomb testing (similar to those conducted by our two countries) in the Marshall Islands by the United States in 1954 resulted in thyroid tumours and cataracts.

The storage of nuclear weapons and the maintenance of nuclear preparedness has resulted in 50 such accidents, fortunately none of which have led to radiation fallout. It has been predicted that if a bomb of the intensity used at Pokhran were to be dropped on any major Indian city, it would result in between two and eight lakh deaths within a few days.

The nuclear explosions should be viewed in the light of previous disasters and the human suffering they caused. Obviously the worst possible health damage of being a non-nuclear nation is preferable to the possible hazards of developing, testing and stocking nuclear weapons, not to mention the likelihood of their use under grave provocation.

There is paucity of information about the health consequences of the use of nuclear technology in our country. The government maintains that no radiation was released above the surface of the ground during the nuclear explosions. But were there any studies to assess the health impact after the 1974 and the present explosions? What has been the effect on the underground ecosystems and to the water aquifers?

Even the peaceful use of nuclear power is surrounded by safety concerns and lack of

# In memoriam

## Nikhil Chakravarty 1913-1998

27 June 1998, a day after the twenty-third anniversary of one of the darkest days in the short history of our Republic, Nikhil Chakravarty was no more. He had been ailing for some time with a brain tumor. At 85, his fabled fighting spirit was somewhat tired.

It is routine to speak well of the dead, of how the nation has suffered an irreparable loss. But Nikhilda was unusual—in his unflinching opposition to the Emergency, in his eschewing of state awards, in his gentle, somewhat ironic commentary on the foibles of our political masters. Above all, he epitomised the rare quality of listening to even those he disagreed with, often vehemently.

Here was a one-time teacher, an erstwhile member of the Communist Party turned journalist who practiced his *swadharma* without deviation. In an era in which journalists play at being politicians, advocating favoured (if not partisan) causes, one suspects with an eye on the chair, Nikhil Chakravarty stuck to the straight and narrow. This when he, reportedly, had the ear of more politicians than any in the profession. He knew how to respect a confidence.

He invariably found time for the young, not so well-known, not only in the world of the media, but those active in a variety of causes. Democracy, transparent and accountable, was his abiding commitment, as was the need to surmount narrow nationalism. From the Editor's Guild, the Press Council, Nandia, to finally Prasar Bharati—his effort was to build up each of these institutions as countervailing centres to media hegemony.

The launching of *Mainstream* in 1962 is probably his most enduring legacy. As a small, independent journal, along with the *EPW*, and *Frontier* (and many others), it has striven hard to provide space to dissenting and analytical views—a space which, unfortunately, seems to be shrinking in mainstream media.

Finally, Nikhilda will be missed most, not just institutionally, but personally, as a friend. Warm, compassionate, patient, tolerant of our many weaknesses, and unswerving in the values he held dear. We at *Seminar* remember and salute his memory.

## POSITION ANNOUNCEMENT

### Program Manager Population Program – New Delhi The John D. And Catherine T. MacArthur Foundation

#### THE FOUNDATION:

The John D. And Catherine T. MacArthur Foundation is a private, independent, grantmaking institution created in 1978. One of America's largest philanthropies, it has developed focused programs in selected areas where it believes that targeted philanthropic effort can make a distinctive contribution. Its headquarters are in Chicago, with small program offices in Palm Beach County, Florida, Russia, India, Nigeria, Mexico and Brazil.

Much of the Foundation's work is carried out through two programs, both of which were recently established by integrating several earlier programs:

- The Program on Human and Community Development supports research, policy analysis and advocacy and improvement of operating practice within the United States in three principal topical areas of focus: access to economic opportunity, child and youth development; and building community capacity. It also supports related grants in mental health policy and research.
- The Program on Global Security and Sustainability places priority on work which encourages peace within and among nations, responsible reproductive choices, a global ecosystem able to support healthy societies, and protection of human rights.

In addition, the Foundation supports the widely known MacArthur Fellows Program, as well as an active General Program which funds media-related grantmaking, and other special projects.

The Foundation is committed to an interdisciplinary, collaborative approach to its areas of interest, and promotes a collegial, team-oriented work style. It values creative, independent thinking and seeks to incorporate a diversity of viewpoints in its staff and its grantmaking.

#### THE POPULATION AREA:

The Population Area works to empower women and men to make informed choices about their reproductive choices and sexual health.

#### JOB SUMMARY:

The Population Program of the MacArthur Foundation, a U.S. based philanthropy, seeks a senior program manager based in New Delhi to coordinate grants to NCOs working on reproductive health in India.

#### RESPONSIBILITIES:

- Program and financial management;
- Represent the Foundation at meetings, conferences, forums;
- Review and analysis of project proposals;
- Grant negotiation;
- Monitoring and evaluation and;
- Writing reports

#### QUALIFICATIONS:

- Educational background in Social Sciences/social Work/Public health;
- Minimum ten years experience in the development field in India especially with a focus on women's issues and reproductive health
- Familiarity with the health and development networks and institutions across the country, grant negotiation, proposal development, program management, research, training, organizing meetings and workshops;
- Excellent interpersonal, networking, communication and writing skills;
- Willing to travel;
- Initiative and the ability to work independently and
- Fluency in English and Hindi

**APPLICATION:** To apply or to recommend candidates, please send cover letter and resume by **August 15, 1998**.

information. Radioactive leaks have been reported from the Rajasthan atomic power station (RAPS). There has been anxiety about the exposure of nuclear plant personnel to excess radiation. And what about the environmental and biological consequences of dumping nuclear waste onto tribal land and into the sea? Nuclear waste from reactors continues to be radioactive for 20,000 years and if released into the environment has devastating consequences to the natural ecosystems and the food chains, remaining in the body for a lifetime. The present secrecy that surrounds our nuclear programme will be further legitimised in the interests of national security. The people of India have a right to be informed and to debate the hazards of nuclear technology both for peace and for war.

There is also the question of preparedness of the government and the medical community for a nuclear disaster? When the Chernobyl reactor exploded in the USSR in 1986, 350 plant workers were affected by acute radiation syndrome, 30 died and 1,35,000 people were evacuated from the area. Within hours the sick were transported to hospitals equipped to handle them, all the workers were decontaminated and within days 6000 medical personnel from all over the country arrived to perform evaluation and treatment of people. This kind of meticulous response probably averted a higher mortality. It is in this context that we must ask: What are the safeguards at our nuclear plants and weapon installations? What is the level of medical preparedness in the event of a nuclear disaster? The inept handling of the Bhopal gas tragedy, the plague epidemic in Surat and the recent typhoon in Gujarat raise grave doubts regarding our ability to cope with a greater kind of medical tragedy.

Do the goals of the government and the scientific establishment which developed the nuclear bomb reflect the needs and aspirations of the people in our country? Our country which is so proud of its achievement has still not addressed issues such as: One-fifth of our people go hungry every day; two-thirds of our children suffer from malnutrition; the commonest causes of death in our country are diarrhoea, malnutrition, respiratory infections, TB, and malaria. While becoming the sixth nuclear power, we still rank 138th on the human development index. The central health budget allocation for this year is only 10.2% of the defence budget. The entire health budget (Rs 3,700 crore) of the Union government for this year is less than the increase in

funding for defence. 'It is those who are not ashamed to be poor who are in need of the bomb.'

As health professionals and scientists today, are we being complicit in the use of science for narrow political ends? The present government is using the nuclear explosions to further its political agenda of creating a 'macho state'. The espousal of weapons of mass destruction by the government and the scientific community as a method of power, challenges the notion of 'value free science' or 'science for the public good.' We must remember that the scientific community provided the justification and the means for the horrors of the German concentration camps and the creation of a Nazi state. Are we being systematically involved in a similar project?

In the light of the health critique, the MFC makes the following demands of the government: (a) a commitment not to perform further nuclear testing; (b) a commitment never to use nuclear weapons; (c) a commitment to stop all further research and development of nuclear weapon systems; (d) to disseminate information to the public regarding:-

- \* the health hazards of nuclear testing, reactors, weapon systems and nuclear waste disposal
- \* the safeguards at nuclear installations to prevent such disasters
- \* the medical contingency plans in the event of a nuclear disaster
- \* the environmental consequences of nuclear testing and nuclear waste disposal.

The MFC would also like to state its commitment to regional peace through dialogue.

Our country's safety is a fundamental priority. But Gandhiji taught us to use non-violent means to obtain our freedom and security. Just 50 years later we are asked to rely on weapons of mass destruction to maintain that freedom.

What are the regional consequences? There is already an exacerbation of regional tensions and this appears to be only a sign of things to come. Will the bomb provide us with greater peace or higher levels of conflict and greater armament? While criticising India and Pakistan, we are against all nuclear weapons and the five nuclear states which continue to maintain their nuclear hegemony. We advocate global disarmament and maintenance of regional peace through dialogue and not through nuclear deterrence.

**Medico Friends Circle**  
Sewagram, Maharashtra

# Backpage

THE relationship between rulers and bards is an ancient one. Both *attract* each other; when insecure they *need* each other. It thus should have caused little surprise when the MHRD under the leadership of Murli Manohar Joshi and Uma Bharati, in a rare display of resolve, appointed 18 'historians' known for their ideological proclivities to the Indian Council of Historical Research (ICHR).

As in the case of the Pokhran explosions, the intentions of the BJP combine have been transparent. It has always held culture (including history) as central to its political imagination, as a resource for constructing its version of Indian nationalism. It has consistently opposed and refuted the claims of its secularist counterparts to a rational and scientific historiography.

But why bother about the ICHR, a crumbling, somewhat derelict body? We do need to remember that barring the UGC, the ICHR is the sole official agency to help promote historical research. And more than the miniscule funds and patronage that it doles out, inefficiently and increasingly irregularly, it seeks to confer the stamp of authenticity and legitimacy on the output it supports. It is this power of legitimacy, backed by the authority of the Indian state, over the reconstructions of our past and present that marks this move as significant. Dismissing it as mere jobbery, or as the 'normal' turnover in official positions which accompany a switch in ruling regimes, would be an error.

But, do we ever get a reasoned and informed debate, a genuine *samvad* about the official guardianship of our memory? Forget the lay citizen, is the professional historian genuinely concerned about and engaged with the functioning of institutions like the ICHR? It would appear not.

The charge today is not just that the ICHR has been packed with historians (many well past their prime) who support the saffron position on Ayodhya, some who were involved with the effort to withdraw the NCERT history textbooks in the seventies. It is also that the basic memorandum of the ICHR has been altered: the words 'rational' and 'scientific' being replaced by 'national'. Also that the statements of objectives in the memorandum have been reduced from five to two.

The charge, if true, is serious and merits investigation. Columnist Arun Shourie (*The Asian Age*, 3 July 1998) refutes it as fabrication. Quoting the Education Secretary, he claims that the memorandum, in its entirety, has remained unaltered since 1978. He also

cites specific ministry resolutions to this effect, with relevant file numbers and dates. One is entitled to ask why those who framed this charge, both in mainstream media and the academia, have so far been unable to prove to the contrary.

As important as the rational/scientific (secular) versus national (communal) debate about the writing of Indian history, is the issue related to its officialising. We are all aware that our reading/reconstruction of the past continuously changes, not only because of fresh evidence and advances in methodology, but because current concerns and fashions have a way of impinging on the writing of history. Successive generations imbue different weightages and values to different events, personalities and processes. Further, much of what passes for history is affected by what is supported, by whom, in what manner and to what ends. In short, history is always contested.

Nevertheless, disciplines do evolve their own norms of scholarship and integrity. Peer review is central to this process. This is why proximity to power, a hankering after official patronage, a conferring/seeking of official legitimacy does little to advance the cause of dissenting imaginations, of alternative truths.

It is indeed unfortunate that bodies like the ICHR have yet to be put through a public social audit, both financial and academic. In popular understanding, it is seen as captive to a certain cabal of historians who have utilized their differential access to an 'official' body to delegitimise others (both individuals and works) while promoting the favoured. There are frequent charges – not just of inefficiency, or nepotism, or corruption, but of presenting a view of our history.

Possibly, this is why those declaiming the current saffronisation and promotion of narrow (Hindu) nationalism carry limited credibility. It is not that their apprehensions are unfounded. The BJP as an insecure coalition is *more* likely to be *more* aggressive in promoting its favoured versions of our history. So we may well witness frequent disputes over Buddhist *jataka kathas* or the iconography of Sita, if not the upgrading/downgrading of different historical personalities. But, having permitted our national institutions to fall into decay, in not having evolved acceptable norms of evaluation, we are likely to once again be subjected to a narrow, partisan and unseemly debate. Not quite designed to serve History.

Harsh Sethi

### **CROSSING THE SACRED LINE**

**Women's Search for Political Power**

**Abilasha Kumari and Sabina Kidwai**

81 250 1435 7

Rs 250.00

Few women participate in politics; fewer still make it to any significant position in the party or government and finally only very few are committed to and closely identify with women's issues and the women's movement. This book looks at these issues in the context of the political parties—their history and ideologies, political commitments, organizational structure, mode of functioning and the place of women's organizations within the party.

### **RETHINKING ISSUES IN ISLAM**

**Asghar Ali Engineer**

81 250.1427 6

Rs 175.00

This is an important collection of essays that range over a wide area—violence, human rights, punishment for crimes, morality and family planning among others. The author's central focus in these essays has been to examine the misconceptions and stereotypes regarding Islam both within the community and in the non-Muslim world. He makes a strong case for 'rethinking' or re-evaluating Islam by Muslims and non-Muslims.

### Interest calculation to your advantage

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

### No prepayment penalty

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

### No annual charge

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

### No commitment charge

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan – not before.

### Processing charge on a 'slab' basis

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

*Loans at the sole discretion of ANZ Grindlays Bank.*

**HOME  
LOANZ**

## Travel first class. Pay economy.

Welcome aboard the Premier Diesel Deluxe. A car that is specially designed to make travelling a pleasure.

The Premier Diesel Deluxe is available with a range of luxurious features.

Ergonomically designed bucket seats with adjustable headrests. Plush carpets and velour upholstery. Tinted glass. 118NE Synchromesh gearbox. PU steering wheel. A back-lit instrument cluster with a quartz clock.

It's fitted with a quiet, eco-friendly engine designed by FNM, Italy, that accelerates rapidly within seconds. Giving you unmatched economy of over 18 kms\* from every litre.

Premier Diesel Deluxe. All the comfort without the expense.

To see the car on display, visit the dealer showroom today. A.C. version also available.

*High on performance. Low on maintenance*

This is 3 year old Shreya.  
Her parents abandoned her  
and vanished. If you turn the page,  
you'll do the same.

With no one left in the world, little  
Shreya doesn't have the slightest  
hope of facing the future, unless she  
gets an education. And that's where  
you come in. To make a dream called

*Nanhi Kali* come true. Through  
*Nanhi Kali*, you can become the foster  
parent of a little girl like Shreya.

By giving Rs. 100 a month towards  
her education, your 'daughter' will be  
put into school and in fact, you will  
receive regular reports about her  
progress including a photograph.

*Nanhi Kali* is a special project of the  
K.C. Mahindra Education Trust - a  
Trust set up by one of the most  
reputed industrial families in India.

A Trust that's been working since  
1953 to promote education and  
enlightenment across the country.

Since *Nanhi Kali* literally means  
'little flower', with people like you,  
we hope to repair the broken  
petals of thousands of such  
underprivileged little girls.

So please don't turn the page yet.

Supported by M/s. Mahindra & Mahindra Ltd.

## ROOTED TO THE CORE ... And headed for the world of the future.

At the core lies a technological strength which has consolidated BILT's position as India's foremost papermaker for over six decades. A strength which propels it into the future.

So that, in 2003 when the Indian paper demand is 5 million tonnes, BILT will meet it with over 70 percent of the brightest, finest papers.

And, as South East Asia starts looking towards India and BILT - for paper, the BILT chemistry will be working in yet another area;

India's largest producer and exporter of phosphoric acid will add one more link to the value-addition chain by making phosphatic fertilizer and pesticide intermediates.

Even as it reaps in returns from corporate agriculture, meshing core strengths with core Indian advantages.

**For BILT, it is back to the roots. Or core strengths, as it were.**

THE MONTHLY SYMPOSIUM POST BOX 338 NEW DELHI 11000

Founder Editors RAJ & ROMESH THAPAR

A journal which seeks to reflect through free discussion, every shade of Indian thought and aspiration. Each month, a single problem is debated by writers belonging to different persuasions. Opinions expressed have ranged from Janata to Congress, from Sarvodaya to Communist to Independent. And

the non-political specialist too has voiced his views. In this way it has been possible to answer a real need of today, to gather the facts and ideas of this age and to help thinking people arrive at a certain degree of cohesion and clarity in facing the problems of economics, of politics, of culture.

# The problem

'When memories die, a people die.'  
'But what if we make up false memories?'  
'That is worse,' replied the old man. 'that is murder.'

When Memories Die, A. Sivanandan, 1997

THESE are strange, somewhat troubled times. Words and phrases have a way of taking on new meanings, new resonances, which often have little in common with their heritage. Now that the official celebrations of the golden jubilee of our Independence are safely behind us, it is time we re-examine our tryst with destiny. What better way than to start with the keywords that informed our struggle for freedom.

From the Mahatma's *swadeshi* to the current ruling dispensation's invocation represents a long journey. Then, as now, a primary concern was the economy. In the early years of this century, we were concerned about the de-industrialisation of the country under British Raj, the unfair competition between the mills of Lancashire and the millions of our poor weavers. In a nation wracked by economic drain, our nascent bourgeoisie often turned to the political leaders for support.

Two of Gandhi's essays in *Young India* and *Harijan* make clear his position. He well understood that the Britisher was top-dog and the Indian the under-dog in his own country. Consequently, he questioned the notion of 'equality of rights' between a giant and a dwarf. 'Before one can think of equality between

unequals, the dwarf must be raised to the height of a giant.... The process may seem harsh but it is inevitable if the millions of the plains are to be the equals of the privileged few.'

But to read Gandhi's call for *swadeshi* as one of reverse racial discrimination, or even as a slogan of 'Be Indian, buy Indian' would be doing him great injustice. *Swadeshi* for him meant not just *svavalamban* and *arthic swaraj* but also a holding of British lives and honour as sacred as our own. As a positive process of both economic and societal regeneration it meant attacking our internal ills, our entrenched inequalities, as much as combating the inequitous colonial order. Above all, it had no place for rancour.

Or take Sri Aurobindo whose strategy to win *swaraj* was based on a doctrine of passive resistance as a political method to bring an end to British rule and act as a catalyst to Indian regeneration. Central to it was an understanding that all share in the struggle and suffering such that a nation could start with a fully developed unity and strength. Otherwise, he argued, we may well end up 'embracing liberty over a heap of corpses.'

He went further: 'To submit to illegal or violent methods of coercion, to accept outrage and hooliganism as part of the legal produce of the country is to be guilty of cowardice, and by dwarfing national manhood, to sin against the divinity within ourselves and the divinity in our motherland.'

Independent India's experimentation with swadeshi has gone through various phases, much of it involving versions of a command economy. The broad consensus of the early decades was a distrust of the market and private enterprise, a primary reliance on the home market (import substitution) with the state (read bureaucracy) in the driving seat. At no stage was there any attempt to educate and mobilise the masses. So, not only did our policies not enjoy popular sanction and participation, we evolved as a nation of supplicants, looking to the government as *mai-baap*. Expert opinions vary, but while the country did develop a diversified, modern production base, the system of planning simultaneously introduced serious distortions and helped entrench a permit-quota raj with its consequent corruption and delays.

Times change, so do fashions. The previous decade, particularly after the collapse of the Soviet Union, seems to have ushered in a high noon for unbridled capitalism. As against the earlier faith in state planning and the home market, the pendulum has shifted to internal and external liberalisation, and globalisation. Foreign capital, technology and products have become the new yardsticks for assessing quality, competence and performance.

It is still too early to seriously assess the implications of this policy shift. What, however, does seem evident is that the opening up (and out) of the different sectors of the economy has created severe dislocations.

Linking up globally implies sharing both the upturns and downturns of the global market. Unfortunately, being minor players globally, we do not have the wherewithal to influence the rules of the game defined, for instance, by the World Trade Organisation with its new rules for governing intellectual property (TRIPS and TRIMS). And since markets habitually favour the better endowed, weaker parties, both globally and internally, tend to be worse off, at least in the interim.

Some of the above is clearly a consequence of the timing and mode of our dalliance with globalisation. The timing was not of our choosing, events being dictated by a severe crisis in our external accounts. Nor, unfortunately, was the mode – the speed, the extent, the sequencing – by which our authorities sought to privatise and regulate our entry into the global market.

As we now approach the close of the decade, the economy is caught in a severe recession, not helped by the global downturn, the meltdown of the South East Asian economies and an increasing volatility in currency markets. Worse, the profligacy of our past policies, with its excessive reliance on meeting the consumption demands of the upwardly mobile middle classes without requisite investments in infrastructure and skill development, has severely handicapped the economy in its efforts at restructuring. Alongside is the fragility of our polity, our systems of governance, our rules and regulations – the breakdown of which is

contributing to a climate of fear and insecurity and a release of atavistic passions.

The new call for *swadeshi* by the ruling coalition has to be located in this new and changed environment. As indicated earlier, the slogan now resonates differently. Is this a call against a hasty and ill-planned integration into the global market? Is it a demand for protection against unfair foreign competition? Or is it, as many fear, merely a seeking of higher privileges in the home market so that inefficient producers with the correct political connections can continue to palm off substandard goods and services by restricting choices for the consumer.

No one today seriously believes that we can go back to the days of centralised planning, with bureaucrats and technocrats calling the shots. Equally, as Gandhi had aptly remarked, we cannot talk of equality between the giant and the dwarf. So what does *swadeshi* now imply?

For Coomaraswamy, *swadeshi* meant much more than making India self-contained and self-reliant, especially in respect of industry and manufactures. It meant doing without things which are not worth having. 'Civilization consists, not in multiplying our desires and the means of gratifying them, but in the refinement of their quality. ... A nation which sees its goal rather in the production of things than in the lives of men must perish.'

He further argued against the notion of *swadeshi* as self-sacrifice. 'It is never worth while in the long run putting up with the second best.' 'Not till the Indian people patronise Indian arts and industries from a real appreciation of them, and because they recognise them not merely as cheaper but as better than the foreign, will the *swadeshi* movement become complete and comprehensive.'

It is unfortunate that without a grounding in a larger philosophical and societal vision, the debate on *swadeshi* has been hegemonised by economists and businessmen, polarised between the pro and anti liberalisers and globalisers. There is little concern about how our resource poor and relatively unskilled citizens can survive and improve their life chances in a competitive marketplace without adequate safeguards and support from the state. More disturbing is the veritable absence of a political strategy, any discussion of the instrumentalities, the organisations through which the competing visions hope to mobilise support.

It is with some difficulty that the country was able to make a dent in the earlier economic orthodoxy. Hesitant and half-hearted, we did embark on a process of

redefining rules and regulations in an effort to reduce the power of the *babus* and unshackle the creativity of the producing classes. Possibly, this might not have happened in the absence of an external impetus. The fear is that with a continuation of the current recession as more enterprises go under, adding to the woes of high unemployment and inflation—a call for *swadeshi* could turn xenophobic.

Some have argued the need to go beyond the false polarities of the state and market or the domestic and foreign. This view, currently on the margins, seeks to question the very model of modern development as inherently inequitable and unsustainable. It would rather locate itself in base communities, relying not only on their own material resources but indigenous knowledge systems, in an effort to rework the discourse on progress.

Insecure nations and societies have a way of turning inwards. We have seen this with the practice of our secularism, the main beneficiary of which has been *Hindutva*. Practising *swadeshi* and *svavalamban* demands a measure of self-confidence. All too easily this can lapse into pride and self-glorification which, particularly if the present is dismal, can locate itself into the past. Accompanying this is a search for enemies, both external and internal. In addition to a Cargill or a Coca-Cola, the frustrated also target all those who challenge the current dispensation, or demand their rights. This today may appear a far cry but there are shades of national socialism in many of our nationalistic and anti-foreigner outbursts.

Tagore, incidentally, was a critic of the middle class dissatisfaction with 'insufficient nationalism'. His version of patriotism not only rejected the violence propagated by terrorists and revolutionaries, it equally rejected the concept of a single ethnic Hindu *rashtra* as anti-Indian, even anti-Hindu. While writing with great sensitivity about the nation as a suffering mother, he dismissed the idea of the nation state as being the main actor in Indian political life. More than a foregrounding of India's civilizational categories or their facile synthesis with the values of Enlightenment, he pleaded for an awareness of the global politics of cultures.

The need today is to resuscitate a positive, an inclusive, a generous *swadeshi*. To build and renew confidence in our abilities and skills in our people and knowledge systems. Above all, to be willing to learn, to change and adapt, to keep our doors and windows open and not be swept off our feet. That is *swadeshi*. This issue of *Seminar* seeks to debate these concerns.

# Swadeshi and nationalism

S. GURUMURTHY

EVEN five years back, the idea of *swadeshi* was considered outdated. To the economist it was anti-economics, to the intellectual it was anti-modern, to the industrialist it was anti-technology, to the media it was amusement, to the policy-maker it was socialism in disguise, and to the politician it was an embarrassment. The combined calumny of all these powerful groups created deep prejudice against the idea of *swadeshi* in India and outside.

But now the *swadeshi* view has overcome all unfair attempts to label it as irrelevant and harmful to India. Today many intellectuals admit that *swadeshi* is not such an inelegant idea after all. Many define it as an 'India-first' approach, like the 'America-first' approach in USA, for they need a foreign lead to define *swadeshi*. Many industrialists agree on *swadeshi* as the idea of strengthening Indian industry and creating Indian multinationals. Even the media and commentators are not as hostile to the idea of *swadeshi* as they were and have begun to view it more seriously. Many political parties and leaders openly support the *swadeshi* viewpoint. The media now talks of *swadeshi* shares as distinct from MNC shares in the stock market. The takeover of various corporates by

MNCs is not just regarded as anti-*swadeshi*, but also against national interests. So the idea of *swadeshi*, interpreted by everyone in their own light, is now very much in the Indian mind.

What is it that turned the Indian mind towards *swadeshi* when just five years ago it had virtually been consigned to the dustbin of history. Before tracing how *swadeshi* began to reassert itself in India, it is necessary to recapitulate how socialism forced its way into the Indian polity, and what it meant in contrast to present day market capitalism.

When at the beginning of this decade the Berlin Wall collapsed and the Soviet Union disintegrated, virtually the entire world defected from socialism to capitalism. The premise was that if socialism failed, capitalism must succeed. During the Cold War, the operating principle was that capitalism and socialism were competing ideologies. In truth, they were two sides of the same coin.

Both view human beings as purely economic creatures and are based on the abrahamanic worldview that the world is secular and materialist, that there is nothing sacred about anything. Both agree that men and women pursue, in the main, economic

prosperity and nothing else; both rule out the existence of God except as the personal view of the believer. Both regard human beings as essentially atomised individuals and do not recognise any natural, cultural and social human collectivities having common faiths, ideals, goals, or way of life. Capitalism believes in sharing the burden of the state with the market, and trusts the market more than it believes in the state as the delivery mechanism. But socialism does not believe in the market and believes only in the state. This is the sole difference. Thus, capitalism and socialism are the same content in two different containers. And yet the world for almost the whole of the 20th century believed that they represented conflicting ideologies.

**T**his was why Mahatma Gandhi told Pandit Nehru that although the latter believed that the capitalist system was the cause for the ills of industrialisation, the truth was that the fault lay in industrialism and no amount of socialisation would cure its ills. The dialogue between Gandhi and Nehru on industrialism, socialism and capitalism dates back to 1928.

Pandit Nehru first wrote an angry letter to the Mahatma accusing him of exaggerating the faults of western industrial civilisation, and belittling its achievements. Nehru also told the Mahatma that the idea of *Ramrajya* was no good in the past, nor would he want it back. He was blunt that whether one liked it or not, western civilisation would gradually overtake India. The Mahatma, stunned by Nehru's angry outburst, wanted to make public the differences between the two, saying that he never imagined that the differences between him and Nehru were so unbridgeable. He also advised Nehru to carry on open warfare with him, because if he (Gandhi) was wrong,

he was causing irreparable harm to national interest. But, Nehru successfully avoided the debate.

Once again, 17 years later, in 1945, Nehru ridiculed the Mahatma for his ideas on *gramswaraj* and *swadeshi*. Here too Gandhi suggested an open debate, but Nehru avoided the dialogue remarking that the elected representatives of independent India would discuss and decide the direction in which the country should move. So the all-important debate between the mentor (Gandhi) and the disciple (Nehru) never took place.

**N**either did the dialogue, which Pandit Nehru had promised to the Mahatma that the elected representatives of independent India would carry on take place. There was no debate at the national level about whether the ideas of *swadeshi*, *swavalamban* and *gramswaraj* articulated by the Mahatma were outdated and irrelevant. There was no discussion on whether India should pursue the free market motto if it discarded the *swadeshi* view or the socialist model, and whether socialist philosophy would suit the Indian psyche. The leadership adopted socialism without a debate, without understanding what it entailed and what changes and adjustments it would impose on our society, polity, ethos and religion.

We assumed that purely through the political process, that too in a democratic polity, we could remould the society to abandon its age-old traditions, beliefs and lifestyle and switch over to socialism. The result was a dual life – a formal modern life as the veneer and the age-old beliefs as the core. The traditional views and lifestyle were pushed underground – seen as illegitimate within the political, economic and modern social intercourse. Alongside, we relegated religion to the sidelines, except

to the extent that the system allowed the minority religion and culture to define our new notions of secularism.

This led to a further duality – while paying lip service to socialism for votes, we institutionalised the permit, quota, licence raj in the name of a mixed economy. This promoted corruption and black money and caused serious erosion of national character. Yet, the society remained where it always was and refused to change, but the polity put on a cloak of socialism. The deterioration reached its nadir when Indira Gandhi virtually turned socialism into theatre. She even labelled those who opposed the dishonesty that went on in the name of socialism as anti-poor, pro-rich, even as American and CIA agents. She grafted the slogan of socialism on the Constitution, pressured the Supreme Court into accepting socialism as a constitutional creed to which the rest of the Constitution was subordinate. Thus, phoney socialism became legitimate politics.

**W**hile the socialist reign was a general disaster, in specific terms it damaged the economic potential of the country. Indian enterprise and entrepreneurship had dominated world trade before the advent of the British; it had dominated the trade in East Asia and Africa even after the British left India.

Before the British established their rule in 1830, India's share of the world's production was 19%, that of Britain 9% and of USA 2%; its share in world trade was 18%, that of Britain 8% and of USA 1%. India had higher literacy than Europe. It is colonial rule that eroded our economic base. When the British left, our share of world production and trade was less than 1%. The British demolished the business competence, initiative and self-confidence of Indians; the demo-

lition work continued more efficiently under the socialist regime in India.

The Indian trading communities turned into clerks while the skilled self-employed became unskilled employees, or turned unskilled and unemployed. A country which worshipped money (Lakshmi) as god was persuaded to treat money makers as untouchables. A nation which had a tradition of treating work as worship and which actually worshipped the tools of trade was organised and trained to destroy all work ethic. The public sector was indiscriminately encouraged with the resulting inefficiency concealed by ideological sloganeering. The installation of a socialist regime was collaterally assisted by the godless idea of secularism. Socialism and secularism alienated the Indian state from Indian beliefs, tradition and values.

**T**he Indian state abhorred talented traders as blood-sucking middlemen, acute financiers and bankers as exploiters and accumulators of wealth and power, and astute industrialists as monopolists and profiteers. In fact, Indian businessmen were treated as undesirables, even as untouchables. The socialist regime perpetuated a mindset in which the best minds of India found it advantageous to seek employment rather than turn employers to provide employment.

In the first two decades after freedom, some of the best minds in the country entered government service instead of setting up business or joining professions that could create wealth and employment; some of them even made business out of the government. That is not all. Socialism made public life government-centric and politics oriented. This disproportionate role for state and politics without any norms to recognise quality and merit, generated a rush into politics for

recognition and power. As the society weakened against politics and money, it gradually turned politics into a profitable industry.

Ordinary people as well as the informed ones, whether in towns or villages, were made to believe that it was the state, not society or community, which would deliver. The result was the falling into disuse of all traditional delivery mechanisms like village communities and social and religious institutions. The ensuing public discourse served to move people away from God and even from the very idea of nationalism. The result was an India which was an antithesis of all that the movement for our freedom had envisioned.

If the freedom movement was inspired by the idea of spiritual nationalism as expounded by Swami Vivekananda, motivated by *Sanatana Dharma* held out by Aurobindo as our nationalism, fertilised by the enchanting *Vande Mataram* of Bankim Chandra, and defined by the ideal of *Ramrajya* as enunciated by Mahatma Gandhi, free India's secular and socialist mix declared every one of these noble and sustaining ideas as irrelevant, unsecular and communal.

**I**t was then that two path-breaking developments took place in the post 1980 years. The Ayodhya movement called the bluff of pseudo-secularism while the collapse of the communist states exposed the socialist rhetoric in India as nothing more than a shadow of the Soviet brand of socialism. This resulted in a massive generation of national self-assertion. The Ayodhya movement restored the pre independence values eclipsed by the secular socialist regime, and illegitimised pseudo-secular ideas and practices.

With its collapse in Berlin and Moscow, socialism became a dead letter in the Indian polity, notwithstan-

ding the false undertaking given by all political parties to the Election Commission regarding socialism. Overnight, the entire intellectual establishment, including bureaucrats and columnists defected to market capitalism. Narasimha Rao and Manmohan Singh dismantled the entire socialist edifice in pin-drop silence. There was not a word of protest—in the Congress or in the CPM or CPI, the Revolutionary Socialist Party or the different Samajwadi parties. The entire nation witnessed and even rejoiced in the way socialism ceased to figure in the resolutions of political parties and in their election speeches.

**W**hen the exponents of socialism abandoned their pet ideology, they swung to the other extreme—they became as ardent and faithful exponents of liberalisation and globalisation as they had been about socialism. They supported every move that dismantled the socialist establishment, even though many of the moves contributed to a dismantling of the Indian state itself.

Indian businessmen, the middle class and the intelligentsia turned so hostile to the socialist idea of the past that they viewed with suspicion any voice of moderation against the thoughtless way in which the entire national course was reversed. They saw every sane voice which advocated a gradual opening up of the Indian economy to global competition as a conspiracy to retain the socialist establishment.

The result was that just as socialism had become a fad, globalisation too became an ideological *mantra*. The socialism of the past legitimised globalisation for the future—without any thought as to what globalisation entailed, and the capacity of the nation to meet it. Anyone who differed regarding the pace or reach of globa-

lisation was branded as anti-modern and even anti-growth. There was no debate as to how, in what stages, in what areas and with what safeguards the change-over from a socialist regime to a free market economy would take place.

Just as our establishment adopted socialism instantly, without debate, and suffered for 40 years, equally instantly it has adopted market economy, again without debate. What it has not realised is that just as 40 years of socialism could not penetrate the Indian psyche defended by its age-old traditions, values and lifestyles, the free market prescription too cannot accomplish what socialism did not. But like an allopathic doctor who prescribes antibiotics as an instant cure for illness, instead of building up of resistance for a long term cure, the Indian establishment has prescribed free market globalisation as an instant cure for the ills of socialism.

**F**ree market globalisation which is presented as the cure today, will eventually prove to be a mere dose of antibiotics—a transitional treatment rather than a durable cure. This is what emerges from the India's experience—and that of the world—in the 1990s. If swadeshi, which was eclipsed by socialism for four decades and ridiculed by the globaliser brigade, is back as India discarded socialism—although with different meaning and implications for different sections—it means that the Indian establishment took less time to realise the mismatch between globalisation and India than it took to understand the unsuitability of socialist ideas for India.

The present trend to view swadeshi thinking as 'not so terrible' is indicative of the fact that the present day India is in transition and the idea of economic globalisation is a transitional flirtation, not a destination.

Why is globalisation a transitional flirtation? Not because the intellectuals and elites in India, inspired by an Anglo-Saxon worldview, and who direct the Indian mind in politics and economics, have the vision of a larger philosophic formulation. It is because Indian society's core values, which are not amenable to the Anglo-Saxon traditions, cannot internalise the idea of globalisation. Because the civilisational, cultural and traditional ideas and forces have a resistance which the state directed ideologies cannot overcome.

**R**emember that despite the unmitigated monstrosity of the communist regime in China which organised cultural revolutions to banish Confucian traditions, what emerged unscathed from the blackest period of Chinese history was the very same Confucian tradition. Akio Morita, a doyen of Japanese business, told Group 7 leaders when they met in Tokyo in 1992 that whatever the great political leaders might do to install a global regime, national, traditional and civilisational factors would thwart the so-called 'global system of trade'. The Anglo-Saxon worldview recognised no value other than its own as fit for survival. The basic justification behind the present effort at globalisation is that the West has finally won against the Rest and that the world is finally being restructured on the basis of western civilisational values. Globalisation assumes a world civilisation modelled after the western.

This is how the West first perceived the post-Cold War World. Francis Fukuyama in his work, *The End of History and the Last Man* declared that the collapse of communism meant that western civilisation had finally won and that world peace was guaranteed on that basis. But this view did not dominate the field for more than a

couple of years. Samuel Huntington, the strategic analyst, came out with his famous theory of 'clash of civilisations'. He forecast, not the final victory of the West over the Rest but a West-versus-the Rest scenario. He visualised the post-Cold War world driven by civilisational factors inspired by religion, not by economics or trade. He saw civilisational blocs evolving as trade and political blocs. He advised the West to come to terms with a world of different civilisations which have to live with each other, and not hope for a world civilisation based on the western to emerge.

Alwyn Toffler agreed that there would be civilisational clashes, not between civilisations defined by religion but among civilisations demarcated by economic criteria. He envisioned a civilisationally trisected world—premodern, modern, and postmodern—clashing with one another, in which he perceived the emergence of city states and the collapse of all nation states.

**Y**et another view, expounded by Lester Thurow, perceived the collapse of the family, community, morals and traditions, leading to the stagnation and decay of capitalism. Thus, the theoretical framework needed for a global regime in trade and politics does not seem to exist. Unless there is a broad theoretical framework in which a world regime can be accommodated, a functional world trade regime cannot be internalised. Therefore, the idea of globalisation fabricated by the West after the Cold War seems to suffer from a myopic vision and ignores the large gaps among nations not amenable to a world regime.

If theory refuses to legitimise a global regime, the functioning of the current global regime equally exposes its disfunctionality. The European monetary crisis, the Mexican crisis

and now the South East Asian crisis have rocked the basic assumptions of the global regime under installation. The greatest danger to the world trade regime – even if the people of the world forget their religious, cultural national and civilisational identities and resolve not to clash in the interest of money and trade. John Maynard Keynes said: 'Money is essentially a destabiliser, and has to be reigned in for economic stability.' This is precisely what the present world regime cannot do.

**I**n fact, the IMF-World Bank-GATT formulation was based on this very idea that money being a destabiliser had to be checked; this applied with greater force to transnational money which worked on the basis of exchange rates between currencies. The IMF was created with the fundamental idea of ensuring stable exchange rates. The world currencies remained firmly linked to the US dollar and the US dollar was linked to gold at a firm rate of 35 USD per ounce of gold.

This system worked well till 1971 when, because of the run on US gold reserves and the world losing confidence in US dollar convertibility, it depreciated from 35 to over 400 per ounce of gold. More significantly, the world shifted to the present system of floating currency values determined by market force of demand and supply of currencies against one another.

It was precisely to avoid this situation that the IMF was set up. The only protection that the weak currencies of the world had against the strong ones was eroded. And now we have a world currency market in which speculative trade in derivatives exceeds 1.2 trillion dollars a day against the annual world trade in goods and services of 4.5 trillion dollars. So, the speculative currency

market has emerged as the chief arbiter of transnational and even intranational economics.

Akio Morita's letter to the G7 leaders pointedly invited their attention to this point. Morita asked them to answer a vital question: If Japan, through efficiency and cost-cutting, increases its production physically by 10%, and if the yen value goes down by 12%, has Japan grown by 10% or fallen by 2%? He asked them another question: Does anyone control the forces that determine currency values? He pointed out that the derivative trading income of Citibank exceeded (in 1992) 150 million dollars a day!

Realising that the great leaders had no answer for any of these questions, Akio Morita argued that a world trade regime required a common world currency. It followed that in the absence of a world currency there cannot be a world trade regime, particularly if the currency for world trade is in the control of one monopoly, country or in the hands of an oligarchy.

**T**he entire effort of the EC is to evolve a currency to match the dollar. But that would create a competitor for the dollar, not answer the question which Akio Morita had raised. Any long term analysis of the present-day world trade regime would indicate not its durability and stability but its instability and transitional nature. So globalisation and global trade regimes are unstable in their very conception and structure.

The issue is whether a nation should restructure itself to suit the unstable global structure and ever-changing global institutions? That is, should a nation be largely directed by global perspectives and institutions or be mainly guided by factors inherent to itself? In other words, should an ever changing global agenda lead a nation to marginalise its national ideas,

beliefs and institutions, or should it be directed by its own national agenda based on its own ideas, in which the global situation plays a marginal role. If the answer is yes – then it is a return to swadeshi. It is this awareness, both at the national and global level, which is gradually persuading the Indian establishment not to treat the idea of swadeshi with contempt.

**W**hat we have now is a slow and painfully slow return to swadeshi and nationalism. That is where the civilisational assertion of India commenced in the pre-independence days. Swadeshi and nationalism were the foundation of the Indian freedom movement. They should have been the foundation of a free India. But the Anglo-Saxon domination of the Indian polity and establishment virtually defeated the very objective of the Indian struggle for freedom. The result was the fallacious attempt to westernise India on the socialist model. When socialism could not scratch the skin of the Indian psyche and collapsed with the demise of global communism, they swung to another Anglo-Saxon view, westernisation through globalisation. This too has become a transition, rather than the destination.

We started the 20th century with swadeshi and nationalism; we are nearing the end of the century with the very same concepts – swadeshi and nationalism. The long interlude with socialism and the current interlude with globalisation are mere flirtations of the Indian elite establishment lacking in self-confidence. Ultimately, Indian society's unwillingness to disown its age-old values and traditions is manifest in the realisation that globalisation cannot be the core thought of India; it is India which will be the core of India, with the world as a marginal influence.

# Swadeshi or self-reliance?

ASHOK MITRA

FOR someone like the present writer reared in a dusty Bengal town seething with radicalism in the late twenties and the early thirties, *swadeshi* in the childhood days had its charm. But it was a partly suspect, partly derisive category too. Mahatma Gandhi, we would freely inform one another, was a prisoner of the Birlas and the Bajajs; the invocation of *swadeshi* was not so much in protest against the immiseration of the Indian masses by the British industrial and commercial monopolies as for the purpose of advancing the interests of the nascent Indian bourgeoisie. We knew what our alternative line was going to be: pursuit of the objective of national self-reliance.

Once the British were expelled, industry and agriculture, we would explain, will be re-built on the basis of the country's own resources. The extent of external dependence will be severely cut down, which did not, however, imply doing without foreign goods and technology of all descriptions. The import of such material and processes from overseas will, however, be in accordance with the dictum of a strict equivalence of trade: imports will be fully paid for by our exports. The nation will be self-reliant, the accompanying conditions of life and living will nonetheless not be like those generally associated with a closed economy.

Till as long as the international terms of trade were not hopelessly tilted against the country and the transnational corporations did not indulge in outrageous hanky-panky with the prices of imported merchandise and inputs, national self-reliance will suggest a degree of openness which will enable the country to enjoy the advantages of superior technology brought in from richer countries.

This genre of *swadeshi* philosophy, however, depended upon one important pre-condition. Maybe foreigners were not enamoured with our economic ideology; maybe there was a continuing controversy on one or two major issues with the colonial power that had been ejected from the country, for instance, dispute over the quantum of compensation to be paid against the takeover of previously foreign-owned installations. It was not considered altogether inconceivable that the former imperial countries might gang up and refuse to trade with us, thereby starving us of much needed technology and capital equipment as well as key raw materials – and perhaps foodgrains too; all this could push our economy to the brink of disaster.

We were not quite victims of uncalled for panic. Historical precedents were not exactly hard to come by. The situation that confronted post-

revolution Soviet Union for a number of years from the mid 1920s onwards was not altogether different from our conjectural hypothesis. Winston Churchill was leading a one-man band in Britain demanding immediate military excursions against the scandal of a communist state polluting the earth. White Russians, who had escaped to Western Europe and the United States of America, were raising funds to organise an army of invasion. The western press was full of the exploits, real or imaginary, of such ferocious anti-radicals as Kolchak and Denikin. Adding to this commotion was the outrage caused by the declaration by the Soviet leadership that no compensation was to be paid to foreign capitalists and equity-holders for their past investments in Russian industry and mining.

**T**his last act of insolence was particularly galling, and western governments, livid with rage, decided to impose an informal economic embargo upon the Soviet Union. The communists, it was deemed, would be denied the supply of crucial industrial raw material and state-of-the-art technology; none of the western countries would export commodities and services to the Soviet Union and none would import merchandise from that country either. Despite the tacit understanding reached among the capitalist countries, there were occasional breaches in the concordat. For instance, buccaneers like Arnold Hammer, a U.S. citizen, discovered stratagems for bypassing the informal embargo and arranged shipments of goods to and from the Soviet Union, thereby easing the economic strain experienced by the world's till-then-only socialist nation. In the process, Hammer also built a private egg-nest for himself; that is another story though.

In essence, western manoeuvres rendered the Soviet Union into a pariah

state. The communist nation had to learn to survive in a hostile milieu. It could do so only by evolving an economic model which laid stress on exclusive dependence on the nation's own resources for sustenance and growth. The fact that the Soviet Union was a huge land mass, with an immense diversity of natural and mineral wealth, helped. But the crucial element in the picture was the surge of enthusiasm for a consistency model appropriate for a closed economy. A group of young economists and statisticians working in the Gosplan took the lead in the matter; they soon broke new ground. One model developed by the economist Fe'ldman attracted wide attention; its logic was implicitly accepted by the Soviet authorities as the basis for resource allocation so as to ensure self-reliant and yet rapid economic growth.

**T**he Fe'ldman model was quintessentially swadeshi in the narrowest sense – and perhaps in the broadest sense as well. Imagine a country which, for whatever reason, neither exports nor imports. It has nonetheless both the will as well as the necessity to grow. In order to attain growth, it is important for it to arrange for investment, that is to say, large-scale capital formation. Since the country is by assumption underdeveloped, it has no extensive base of industrial output and hardly any production of capital goods. The economy is unable to import goods of this kind because it is a closed economy, whether by volition or because of decisions taken by external powers. It has, accordingly, to start investment activity from scratch.

This is possible only if, right from the commencing year, a significant proportion of the national product is set aside as saving which could fructify as capital formation. The higher the proportion of savings, the

higher will be the rate of investment goods; the higher, it follows, will be the overall rate of growth in the economy. The principal issues for decision at any point of time are therefore: (a) the allocation of production between investment and consumption, and (b) the allocation of investment between capital formation for the production of investment goods and that for the production of consumer goods.

**G**eo-political considerations can influence the parameters of the model at this stage. The country is encircled by capitalists, who can at any moment violate its borders. It is therefore important to strengthen, with extraordinary speed, capacity in the capital goods production sector, including the production of defence equipment. The highest emphasis has accordingly to be placed on boosting further the rate of investment. In a closed economy, the rate of domestic savings will be mathematically equal to the rate of investment. Raising the proportion of investment goods in the system will automatically lead to a rise in the rate of savings and investment; it will also ensure that the rate of consumption goes down, for investment goods are neither edible nor usable for any other form of consumption.

The rigorous application of the Fe'ldman model will yield, even for an impeccably closed economy, an exceptionally high rate of growth and this despite the non-availability of external credit of any kind and the absence of foreign trade. Modalities pursued by the Soviet planning authorities in the 1930s and the 1940s were in strict conformity with the Fe'ldman prescription: consumption was cut down to the bare minimum and investment was pushed up.

This stern model of growth, to be even moderately successful, evidently calls for a strong administrative

arrangement which can put a brake on the propensity to consume on the part of different sections of the population. This is no easy task. In enforcing the regulatory measures, the authorities need to keep in constant touch with the desires and urges of the people, just as much with their complaints and grievances. The adaptation of the Fe'ldman model was indeed responsible for the extraordinarily high rate of growth attained in the Soviet Union during the decades from the 1930s onwards; the enlargement of the heavy industry base and the infrastructure for a strong defence network were the outstanding achievements of the model. At the same time, though, the failure, for whatever reason, of the Soviet leadership to gauge the sentiments of the masses, including their hankering for a richer level of consumption, was a major reason for the collapse of the Soviet Union in the final quarter of the century.

**S**logan-mongers shouting themselves hoarse in favour of swadeshi will therefore need to be clear in their minds on the alternative they want to opt for. In the current milieu, with the tide of globalisation rising high and large sections of the middle class, particularly the younger progeny, completely sold on consumerism, an economic programme of swadeshi along Fe'ldman lines is, on the face of it, a patent impossibility in India. But suppose in the wake of the Pokhran explosions, the western governments, particularly the U.S. administration, are so peeved with India that they decide to enforce economic sanctions in a ruthless manner. The country will sooner or later then face enormous difficulties in its external economic accounts. In such a situation, curbs on consumption will have to be ordained, irrespective of whether the domestic consumers like it or not. This hard

fact of life will have to be driven home into the psyche of the comfortably placed.

Swadeshi has its flip side, just as the swadeshi bomb has. Should opting for the bomb mean a season of cessation of foreign credit and assistance, a curb on consumption, temporary or otherwise, has to be the inevitable consequence. There is no doubt that this will herald a crisis of major proportions, for this nation has proceeded extraordinarily far with the thoughtless indulgence of high consumption on the part of its upper classes. To restrain that propensity could indeed provoke fierce resistance.

**M**ind you, a strict enforcement of the Fe'ldman model will not make much of a difference to the living standards of the overwhelming masses of the country's poor: they are deprived of most of their basic needs now, they will continue to be deprived of basic necessities of life in the altered circumstances as well. It is the upper and middle classes who will have to face the predicament of undergoing sacrifice, something altogether foreign to their experience until now. They are unlikely to accept such an arrangement, unless of course a convulsion of the dimension of what has accrued in Indonesia also overruns them.

Swadeshi is a hard taskmaster. It and a soft state do not go together. And those who keep clinging to the notion that, never mind official sanctions from western countries, the leeway will be made up by larger private capital inflows are living in a fools paradise. But the present set of rulers, going by the desperate manner in which they have commenced to humour foreign economic interests, know fully well which side their bread is buttered. Swadeshi is dead – and buried several fathom deep.

# Economic policy as a by-product

VINOD VYASULU

'I didn't know that Cheshire-Cats always grinned; in fact, I didn't know that cats could grin.'

'They all can,' said the Duchess; 'and most of 'em do.'

'I don't know of any that do,' Alice said very politely, feeling quite pleased to have got into the conversation.

'You don't know much,' said the Duchess; 'and that's a fact.'

Alice did not like the tone of this remark, and thought it would be well to introduce some other subject of conversation. While she was trying to fix on one, the cook took a cauldron of soup off the fire, and at once set to work throwing everything within her reach at the Duchess and the baby – the fire-irons came first; then followed a shower of saucepans, plates and dishes. The Duchess took no notice of them even when they hit her; and the baby was howling so much already, that it was quite impossible to say whether the blows hurt it or not.

Lewis Carroll

THERE is usually a difference between what a political party says it will do if elected and what it actually does when elected. What a party promises has something to do with its vision of the future, its hopes for the people, and its

assessment about the chances of winning. What it actually does has to do with the realities of exercising power. One may expect this to be true of the new Bharatiya Janata Party led coalition as well. Especially because there are known differences on many issues between the various parties that constitute the ruling alliance.

When it comes to the BJP vision and what it has promised, things are not all that clear. In its early days as the Jana Sangh, the precursor of the BJP, the party had simple free market ideas. If anything, it was an adjunct of the better known Swatantra Party. The Jana Sangh merged with other parties, on an anti-Congress platform, to form the Janata Party after the Emergency. Its economic policy then got merged into that of the larger party. Anyway, at that time the economy was not the major issue – restoring the democratic process was.<sup>1</sup>

1. And that was not completely done. For example the 74th amendment to the Constitution did not undo all that Indira Gandhi had

When in 1980, this group split from the Janata Party to form the BJP, the major issue was one of dual membership – in the RSS. It was this that formed the bedrock of the vision of the new BJP, which proclaimed itself a Party With A Difference. It is part of what is today called the Sangh Parivar – a set of institutions that work closely together, of which the BJP is the political arm. It speaks of an Indian-ness, of what is today called *Hindutva*. Related economic concepts seem to be self-reliance and *swadeshi*. The basic vision seems to be of a free, independent, economically strong India. That is something many will share. The differences will come over ways of converting that vision to reality.

**T**he party has been engaged in carving out a distinct identity for itself. It believes that India is 'one nation, one culture, one people', and that it speaks on their behalf. It calls parties like the Congress and the left 'pseudo-secular'. India, it argues, can emerge as a world power only if it draws on its traditional strengths, which, it asserts, are encapsulated in *Hindutva*. It speaks of a glorious past on which present day India must be built.<sup>2</sup> It sees western culture as a distraction, as a fetter on our efforts to reconstruct that past. It argues that in recent times India has gone on a different path,<sup>3</sup> and this the BJP seeks to correct. Clearly, there have been

done in the 72nd amendment viz. on the need for the President to act on advice given by the Council of Ministers. When it comes to authoritarian tendencies, all the mainstream parties seem to be in agreement. This may become a big issue in the coming years.

2. Those who disagree do not deny the glorious past. They also point out that Indian society was marked by (gender and other) injustice and inequality and that India in future must not continue this. They point to the achievements of others and what we can learn from them.

3. Nehruvian socialism, undesirable westernisation, and so on. Isolationism and autarky

errors in the past that have been pointed out to the public; but it seeks to correct them, not in an administrative sense but at a fundamental level, by introducing correctives based on its notion of *Hindutva*. This is clear from its election manifesto. It is also clear that many do not agree, but that is another matter.

**T**oday, the BJP is setting the agenda in much the same way as the Congress did some years ago. In its insistence on *Hindutva* the BJP differs from all the other parties, including many who are its coalition partners.<sup>4</sup> For the time being, in the interests of being in power, it has said that this matter will not be part of the National Agenda of Governance of the ruling coalition. But it is unlikely to give it up all together. What it can do, it will probably do. The effect of that, so far, has been anything but positive.

It would appear from all this that *the economic content of the party's programme is derived from something else*. It is not a distinct entity within that ideology, but an aspect –

are not ruled out in this view. Some argue that eliminating all foreign influences can only result in good.

4. There are many reasons why other parties have come together with the BJP in the recent elections. One is opposition to the Congress – as in the case of the Telugu Desam Party. Another is local considerations, as in the case of Jayalalitha's AIADMK. The Samata Party is opposed to multinational corporations and thus finds the economic dimension of *swadeshi* as protection attractive. These parties also have major differences with the BJP. The United Front came into being on the negative platform of keeping the BJP out of power; such an agreement on the basis of 'my enemy's enemy is my friend' cannot stand the test of time when the parties are pulled by different pressures – as the TDP case shows. But it did leave behind some positive features, such as respect for federalism. It showed that coalitions without charismatic leaders from the Nehru family can work. What is needed is agreement on a concrete programme of action to which many parties are committed; the

not necessarily major – of *Hindutva* itself. Thus, for a student of economics, it is not easy<sup>5</sup> to identify the different strands that go into the 'economic package' of this political party. For the party itself this may not be an important question. 'Look after *Hindutva*, and the economy will look after itself' seems to be the basic attitude – or premise, of the BJP.

The nuclear explosions are, I think, evidence of this attitude. They were important in terms of an assertion of Indian pride – and Saturday the 16th was celebrated by the BJP – not the ruling alliance, but the BJP – as *gaurav divas*. If the country's economy suffers as a result of sanctions imposed by the international community led by the United States, it is proof of their ill intentions towards us. It strengthens the *swadeshi* idea. And it is not inconsistent with moves to attract foreign investment after the blast, because that will be seen as increased respect for a nuclear and powerful India. There is no inconsistency involved because there is no basic theory involved.

**T**his is particularly so because the party has co-opted issues and programmes from many others as it went along. The uncharitable can say that for a party that never understood the economy this is understandable opportunism. For example, its ideas on self reliance – *swadeshi*, to use that confusing term – have a lot in common

country seems to be far from that goal. The issues that divide political parties are many, and I doubt we have seen the last of such alliances.

5. I find it difficult to think of any from among say the top 100 Indian economists who openly ally themselves with the BJP. It has not been able to reconstitute the Planning Commission, and justification for its policies has not been coming from the group of nationally respected economists. It was different with the earlier regimes.

with what was often understood as the position of the left. That is, that the country must build up a self-reliant domestic industry, with protection if need be,<sup>6</sup> to stand against imperialism. Again, for the same reason, the left has been a strong proponent of the public sector. The BJP has also made pro-public sector noises, but without the ideological reasoning of the left. Thus, the proposal to disinvest to raise money is easy to understand; the problem is to justify it to a sceptical public.

**T**he left has reasons for opposing Congress type globalisation. It has reasons for opposing the opening up of the insurance sector, or the kind of reforms that have been introduced in the financial sector. The privatisation of nationalised banks, the permission to start new private banks, the expansion of foreign banks, the setting up of local area banks – these are all things that the left is opposed to, but which the Congress and the United Front governments introduced. In spite of such agreements, the left would not join hands with the BJP with which it has fundamental differences. The BJP had mildly opposed these policies when in the opposition to the United Front. But its reason is simple: it ‘hurts’ India in some (ill-defined) sense. The left opposes them ideologically.

The left had developed these ideas in the context of a fight against imperialism, and they were grounded in a well defined ideology. For our purpose here, it is not pertinent whether the left is correct or not: the left has an ideological position from which its programmes are logically derived. The BJP does not. Yet, the BJP has taken on many of the left’s programmes. These same programmes are now packaged in Hindutva. Defying the World Bank

and the WTO (while following our commitments to it completely in its export-import policy – which perhaps is the policy of the Lok Shakti) are patriotic actions in this framework. What is to be done after such defiance is left unsaid. Defiance, it would appear, is enough. It restores our national gaurav!

The BJP speaks of liberalisation, but opposes globalisation.<sup>7</sup> It has the support of a number of important Indian industrialists. Many years ago, Viren Shah was an MP from this party. Today, people like Rahul Bajaj have given it their support. These groups argue for some kind of protection, but given that they have faced the heat of competition and lost market share, it is probably self-interest suitably disguised. Of course, that in itself does not make it wrong.

**S**ince India had a long regime of protection, in which some groups got an advantage, such relationships have been useful to some of the BJP constituents. Is the BJP just paying off a political debt by talking of swadeshi, or has it a sound basis in reason for what it is doing? The withdrawal of several budget proposals when its supporters – or vested interests – protested, showed a lack of economic logic; it was simple opportunism. We must remember that much water has flown down the Ganga in the last seven years. Is it feasible now to talk of liberalisation without globalisation? How and why?<sup>8</sup> The issues have to be spelt out in concrete detail, not fuzzy intentions. The manifesto,

7. My own position on these issues has been spelt out in *Crisis and Response*, Madhyam Books, New Delhi, 1996.

8. These issues have been discussed in Amit Bhaduri and Deepak Nayyar: *The Intelligent Person's Guide to Liberalisation*, Penguin, New Delhi, 1996. But I do not think the BJP would go along with this formulation.

the NAG and the budget<sup>9</sup> have little to say about all this. The budget, if anything, shows an ostrich-like attitude to the economy.

**Y**et, the BJP supported the Congress government led by P.V. Narasimha Rao when it reversed long standing policy and adopted a policy of liberalisation and globalisation. If it were not for the support of the BJP in 1991, the new economic policy would never have survived. Yet, the party remained in opposition because Hindutva kept it distinct. For it to now claim that there were fundamental flaws in the new economic policy is simply untenable. This feat was possible because the economy was not its main concern – Hindutva was, and that was better captured by the Masjid-Mandir issue. *Rath yatras* are more important than economic policy! More correctly, economic policy follows from a rath yatra.

In states where it is in power, it has negotiated loans from the World Bank – in U.P. and Haryana, for example, for power sector reform. The conditions set by the World Bank do not differ, for example from those in Congress ruled Orissa – the forerunner of power sector reforms of the World Bank type. There is therefore no reason to expect that it has anything very different in mind for the country.

In a real sense, the BJP must be given political credit, along with Narasimha Rao, for the new economic policy. As an opposition party it could have voted against the Congress economic package: indeed, it would have been expected to play its role as an opposition party. It did not do so. And the reason can only be that economic issues are peripheral to its vision of India. Its battles lie elsewhere. The

6. It is not clear how this differs from the old Nehruvian import substitution industrialisation model.

9. For my views on the budget, see *Economic and Political Weekly*, 8 June 1998.

economy is a minor nuisance that has to be dealt with. It is a political headache to be treated with paracetamol or nuclear blasts – it does not matter which.

**W**hat about the approvals for foreign investment that the Industry Ministry, under the control of the BJP's Sikandar Bakht, has been awarding at breakneck speed? What about its soft line in the Maruti dispute? Does this not contradict its Hindutva/swadeshi line? Is the government in any way aware of any inconsistency in this matter?

How does the ruling coalition characterise the economy? Let us consider the fiscal situation. The BJP has kept the finance portfolio because of the power that this ministry can wield. The PM was unable to get his first nominee for the job. It did not seem to matter! If the economy was on top of the agenda, this ministry could not have been treated in this cavalier manner. The Planning Commission has only a deputy chairman – an important party member, but it has yet to be reconstituted – and he has been busy with international diplomacy. For a party that considers the economy important, this should have been a matter of priority.

Finance Minister Yashwant Sinha has talked of tough decisions. He has promised to reduce the fiscal deficit. The earlier government failed to do this, while ignoring the revenue deficit – the difference between annual income and expenditure of the state. The fiscal target can be achieved by further reducing the role of government in the economy – something that the BJP may not be averse to in some sectors. But how? His budget, if anything, has aggravated both the deficits.

Recently, the coalition faced problems when it chose to promulgate

ordinances to set up regulatory agencies for pricing electric power. Here it has behaved like any past government, displaying a preference for promulgating ordinances to introducing bills in the legislature. And it has promised that free power for farmers will continue even after the agencies begin to function. This will increase the subsidy burden. Where then is the difference in terms of economic policy?

**G**iven its middle class base, it is under pressure to increase the limit of income free from income tax. This demand may have been relevant in the heyday of Indira Gandhi when direct tax rates were high. But today, when the highest marginal rate is a ridiculous 30%, this is, in economic terms, completely unjustified. But for a party for which the economy is (really) on a backburner, the claims of political support are probably more important. But then, where will the revenues come to finance free power to farmers – and other goodies for others?

The defence minister has been making noises about India's enemies, and the need to be prepared. He comes from a trade union, socialist background and possibly sees an increase in defence expenditure as beneficial to his constituency. He has long favoured a nationalist stance, and his anti-multinational credentials are impeccable. He is also among the honest politicians of this country. But if the government goes along with him, where will the money come from?

And now this government has taken the irreversible step of conducting nuclear tests.<sup>10</sup> This has triggered sanctions, especially from the United States. Is this the BJP's way of intro-

10. In the process, giving the go-by to the morally strong position we had for not signing the NPT and the CTBT.

ducing swadeshi?<sup>11</sup> And if it is then why has it cleared so many foreign investment proposals immediately after the tests? Is that consistent with swadeshi? Or is keeping an important lobby happy more important?

**I**f it is possible to state clearly what India's priorities are in the economic front we can proceed to try and see what the BJP government may do. I list them as follows:

\* A large percentage of the population is below the poverty line. While it is true that there has been some improvement in the poverty situation in the last twenty years, it is by no means enough. Therefore, a strategy to reduce poverty must be given importance in economic policy. There are, of course, many approaches to this. Whether the government will continue with the 'growth is the best way of reducing poverty' approach of the structural adjustment programme remains to be seen.

\* It is easy to talk of growth, but will give away policies continue? Free power to farmers in some states, we are told, will continue. How about other areas of pandering to special interest groups? Will irrigation water be priced? What about fertilizer subsidies? What about budgetary support for all kinds of things in the public sector? Even if some of these are to continue, where will the money come from? And come without the inflationary pressures that accompany deficit financing?

\* The situation with respect to nutrition, health and education continues to be dismal. The social sectors have been neglected in India. To a large extent this is the responsibility of the states. A recent estimate shows that Karnataka spends only seven

11. Such an argument was made by Narendar Pani, *The Economic Times*, 16 May 1998.

rupees per year (after excluding salaries) per enrolled child on primary education.<sup>12</sup> And this is just slightly higher than the all India average! In the last fifty years we have spent far too little on these two vital sectors, constitutional obligations notwithstanding. If the BJP were to change this they would really be doing something new. But there has been no evidence so far that they will break with the past.

\* The bloated government bureaucracy in the Union, states and parastatals, needs to be curbed. This is a necessary condition for the economy to move forward. Yet, the BJP coalition has pandered to the *habus* – apart from the new pay-scales approved earlier, it has raised the age of retirement. All this does not bode well for a public sick of corruption from this segment of the population.

\* The fiscal system needs an overhaul. The earlier governments have spent considerable time in testing the Laffer hypothesis, but the evidence is clearly not in favour. Resources will have to be raised from direct taxation. Efforts by the earlier government to widen the tax base will have to continue. But the BJP in the past has promised wide ranging relief to different classes of people. These will now come back to haunt it. Without such increase in direct taxes, and an increase in the proportion of revenue from such taxes, little can be achieved.

**W**e have a situation in which low priority areas like defence and subsidies have political claims on the budget. We have a situation in which wild promises of tax relief have been made by the BJP, probably in the expectation that it will remain comfortably in the

opposition. Or because the economy is not its major concern. Today, as the leader of the ruling coalition, it has to act. And it has no ideas of its own, at least as far as the economy is concerned.

**T**he irony lies in the fact that the BJP may really be ahead of others in the questions it has raised. We have to ask what a nation state means today. The world today is different from the one that emerged from the throes of the Second World War. The idea of the nation state has considerably evolved. The Euro has taken birth; the multi-lateral agreement on investment is being seriously discussed. The monolithic, centralised state is giving way to something else. Markets and technology are binding the world together. These are developments that require serious thought. Recent developments must be evaluated; the experience of nations voluntarily ceding elements of sovereignty, as in Europe, has to be much better understood. What will the multilateral agreement on investment imply? What is the nature of the nation state in the emerging world environment? The BJP has asked the question, but looked to mythology for an answer.

No one will argue that international relations are conducted on the assumption that all nations are equal – if that were so, some countries would not have a veto on the United Nations Security Council. No one argues that the CTBT is non-discriminatory. But many do point out that, imperfect as it is, there were advantages to be got by signing it.

But in an unequal world there is no uniformity. There are areas of opportunity as Korea has demonstrated. History also tells us that novelty keeps emerging. Historical paths are unique – what Korea did yesterday, others cannot imitate today. Each country has to find its own path. As the

Mexican proverb so astutely points out, a path is made by walking.

The BJP is right in stressing the need for India to make its own path. But that path has to be made by our diverse people building on the many things – good and bad – our history has given us. We cannot go back in history. In insisting on the base of one nation, one culture, one people, it seems to be ignoring history. Today's nation state cannot be modelled on a fortress.<sup>13</sup> It has to be open to ideas and influences. It has to be inclusive, not exclusive.<sup>14</sup> To take a narrow view, to deny ourselves the benefit of wisdom and experience elsewhere, is the politics of despair. And now, with Pakistan having returned the compliment by conducting its own nuclear explosions, both countries will face sanctions. In an eye-ball to eye-ball confrontation, spending scarce money over weapons that cannot be used, modernity may bypass us both. For neither, it appears, is economics a major concern.

**W**hile each country's tradition is a valuable heritage, that tradition alone is not enough for economic and social progress. There is much to learn from the experience of others, and there is much work to do in trying to define one's own path to traverse. That is a task waiting to be done. The BJP, through Hindutva, is not attempting it. It is only living in a mythical past.

13. Historical parallels could be the National Socialist Party of Germany with its concept of Aryan purity and the Black Shirts of Italy, like the disciplined khaki shorts of the RSS. What can we learn from these historical experiences?

14. The BJP seems to have embarked on a path where it will pursue its agenda, especially in matters that are irreversible. In testing nuclear weapons it has changed the situation for all future governments, whatever their views. It may be expected to take more such steps – especially where the states are concerned.

# Food freedom and economic freedom

VANDANA SHIVA

GLOBALISATION has generated widespread social, economic and ecological insecurity. It has undermined citizen's freedoms and established corporate rule. What we need is a new movement for freedom from corporate rule, the threats from which are most significant in the area of food and agriculture since food is the most vital of all necessities and agriculture is the most significant livelihood of our people.

Globalisation has become a threat to agriculture and food security by allowing global corporations to become larger and take control over agriculture, and placing the right to trade

above the right to food. It has introduced new forms of property rights in seeds and plants through 'intellectual property rights' and has introduced new genetic engineering technologies, such as the 'terminator technology', which is the equivalent of the nuclear bomb in the field of genetics.

Food is a good symbol to see how the powers of citizens, the state and corporations are shifting. On the one hand, the role and function of the state in guaranteeing the right to food is being dismantled. During the World Food Summit, the U.S. Secretary of State stated that food could no longer be recognised as a right since the right

to food would interfere in free trade of food commodities. On the other, domains in which people have organised themselves are being taken over by the state on behalf of corporations. Two examples of this threat to people's freedom in the area of food are the denial of farmers to save seed and denial of citizens to set food standards.

**P**atents on seed have been used by corporations to treat the inalienable right of farmers to save seed as a theft and a crime. Organic standards and labelling are a means which people have created to ensure that food is free of chemicals. For small organic farmers it is a means of survival and a way of guaranteeing food safety for the consumer.

The U.S is now changing the standards of 'organic' labelling. The USDA will allow fruits and vegetables to be labelled 'organic' even if they have been genetically engineered, irradiated, treated with additives and raised on contaminated sewage. Under the new proposals, 'organic' livestock can be raised in batteries and fed with the offal of other animals. Organic food is thus being redefined to include all that it was meant to replace. The law also forbids setting of standards higher than those established by the department. Farmers will, in other words, be forbidden by law from producing and selling 'good' food.

Similarly, in the area of genetically engineered crops and food, while the corporations claim absolute rights through 'intellectual property rights', they are also ensuring that they will bear no responsibility for the ecological and social costs arising from genetic engineering. Genetically engineered crops and foods are being launched in a context in which profits are privatised through IPRs and costs are socialised, even though the pub-

lic is deliberately kept ignorant of those costs. Social and ecological costs are hidden from the public view through denial of the need for bio-safety regulations and the consumer's 'right to know' through labelling of genetically engineered foods. Society is thus being pushed into a situation in which citizens increasingly become victims of ecological and public health disasters but can do nothing about it. They are being robbed of their basic rights as producers and consumers by being forced to accept costs to their health and environment, which as free and informed citizens exercising democratic rights they would never accept.

**T**he imposition of genetic engineering and its potential hazards for society is a product of totalitarian structures in which citizens are denied their fundamental rights to safety and security, and are prevented from exercising their democratic choice in the vital area of food production and consumption. The emergence of genetic engineering has been based on the violation of democratic rights of people, and through the establishment of totalitarian structures.

Corporate totalitarianism is different from other forms of totalitarianism because it is exercised through a fiction and hence is not like conventional dictatorships in which the dictator has a clear identity which people recognise and see. Corporate totalitarianism is also different from dictatorships we are more familiar with because it is the only slavery which does not need the slave. It rules through dispensability rather than exploitation. It treats communities, people, countries, ecosystems, species as disposable and dispensable. They have no protection, no sanctity. Only the dollar is sacred.

The terminator technology is a good example of how the sanctity of

life is being destroyed and that of the dollar established. The USDA and Delta and Pine Land, now owned by Monsanto, have a patent on a technology which leads to the termination of seed germination to ensure that farmers have to go to corporations to buy seed every year. When we sow seed we pray, 'let this seed not be exhausted.' The prayer of Monsanto as expressed through the terminator is, 'let this seed be terminated.'

**M**eanwhile, the global corporations controlling agriculture are becoming bigger and more powerful. Monsanto, which used to be a chemical company, has bought up seed companies worldwide, including DeKalb, Agracetus, Calgene, Holden, Asgrow, Mahyco and most recently Cargill Seeds. Corporations like Monsanto are genetically engineering seeds so that more of their proprietary chemicals are required. For example, Round-up Ready crops are designed to be resistant to Monsanto's broad spectrum herbicide which kills all plants. Monsanto's terminator technology is aimed at preventing harvested seeds from germinating so that farmers are enslaved to it for seed supply.

Globalisation is thus establishing a system in which species have no freedom, farmers have no freedom, consumers have no freedom, and countries have no freedom. We are entering a system designed to ensure total control of corporations over the food system, which translates into food slavery.

*Swadeshi* agriculture in this context of global monopolies needs to be based on:

- \* protection of indigenous biodiversity as a source of freedom for nature and farmers;
- \* protection of the collective, cumulative innovation embodied in our indigenous knowledge systems through

alternatives to western style industrial IPR systems by evolving collective rights regimes that protect our intellectual and biological commons; and \* freeing farmers from chemical intensive, debt intensive agriculture through internal input, sustainable agriculture systems.

**S**wadeshi agriculture is based on freedom for the earth from poisons and toxics, freedom for biodiversity to evolve and create abundance, freedom for farmers from debt and patents, and freedom for consumers from high prices and contaminated foods. The contemporary discourse on swadeshi and *swaraj* has, however, been severely distorted by the discourse on globalisation.

Central to India's movement for freedom from colonialism were the concepts of swadeshi, swaraj, and *satyagraha*. Swadeshi is the spirit of regeneration and rejuvenation, a method of creative reconstruction in periods of dependency and colonisation. According to swadeshi philosophy, people possess both materially and morally what they need to evolve to build their society and economy and free themselves of oppressive structures. Economic freedom, according to swadeshi, is based on endogenously driven development rather than externally controlled development.

For Gandhi, swadeshi was a positive concept based on building what a community has in terms of resources, skills, institutions and transforming them where they were inadequate. Imposed resources, institutions and structures leave a people unfree and are non-sustainable. The collapse of the Nehruvian model based on import substitution rather than endogenous development indicates how patterns of development which do not emerge from self organi-

sation are unsustainable. Swadeshi for Gandhi was central to the creation of peace, freedom and sustainable development. It is based on people's economies and their ability to organise themselves. Swadeshi or self-organisation in economic affairs is the basis of economic freedom, without which there can be no political freedom, or self-governance and self-rule.

Swaraj, or self-rule, is the birth-right of all people. The phrase that echoed most during our freedom movement was *swaraj hamara janmasidh adhikar hai* – self-rule is our birth-right. For Gandhi, and for the contemporary social movements in India, self-rule does not imply governance by a centralised state but decentralised self-governance by local communities. From the mountains to the seas 'Nate na raj' and 'our rule in our village' are the slogans of our grassroots environmental movements.

**I**n periods of injustice and external domination, when people are denied economic and political freedom, reclaiming freedom requires peaceful non-cooperation with unjust laws and regimes. This peaceful non-cooperation with injustice, revived by Gandhi as *satyagraha*, has been a democratic tradition in India. Literally, *satyagraha* means the struggle for truth. It is Gandhi who argued that no tyranny can enslave a people who consider it immoral to obey laws that are unjust. As he stated in *Hind Swaraj*: 'As long as the superstition that people should obey unjust laws exists, so long will slavery exist. And a non-violent resistance alone can remove such a superstition. *Satyagraha* is the key to self-rule or *swaraj*.'<sup>1</sup>

Swadeshi is not obsolete in today's context. It is the creative alter-

native to both the rule of the centralised national state of the Nehruvian model and the rule of global corporations and global institutions such as the WTO (World Trade Organisation). Economic freedom requires reduced control by the state and minimal control by the World Bank, IMF, WTO, the G7 and global corporations. It is freedom for the people of India to have secure livelihoods, to have control over the policies and resources that make their livelihoods.

**S**ince agriculture is our predominant source of livelihood, the globalisation of agriculture is emerging as the most severe threat to a economic freedom and the survival of the poorest Indians. The suicides by Indian farmers from Andhra Pradesh to Punjab is merely the tip of the iceberg of the economic stress stalking rural India. As farmer Jagjit Singh Brar said at a meeting on suicides organised in Sangrur, 'The farmer is losing his self-confidence. He has lost his freedom and is deep in debt.' The farmers' slavery is linked to the new economic policies which have encouraged free market expansion of seed and agrochemical companies. Costly seeds and costly inputs are being pushed through costly credit and farmers' debts are rising, pushing ever increasing numbers to suicides due to indebtedness.<sup>2</sup> Future slavery of farmers is emerging both through new 'intellectual property rights' and through corporate control of agriculture.

The Eurocentric concept of property views only capital investments as investment and hence treats returns on capital investment as the only right that needs protection. Non-western indigenous communities and cultures recognise that investment can also

1. Gandhi, *Hind Swaraj or Indian Home Rule*. Navjivan Publishing House, Ahmedabad, 1938, p. 29.

2. Vandana Shiva and Afsar Jafri, 'Seeds of Suicide: the ecological and human costs of globalisation of agriculture', *RFSTE*, 1998.

be that of labour or of care and nurturance. Rights in such cultural systems protect investments beyond capital. They protect the culture of conservation and the culture of caring and sharing.

**T**he patenting of our indigenous knowledge and biodiversity is one aspect of colonisation of swadeshi knowledge and *desi* seeds. The pressure on India to introduce western style IPR regimes for seeds and agricultural inputs is another.

In its election manifesto the Congress party referred to globalisation as *arthic swaraj* but equated economic freedom with globalisation.<sup>3</sup> The BJP government, which had won elections on an anti globalisation and swadeshi plank, has now made a rapid turn-around, announcing that swadeshi is not anti-globalisation. The commerce ministry removed restrictions from 336 items in its new export-import policy, including pepper and shrimp, remarking that this was swadeshi. The industry minister stated that he would implement TRIPS and that this step was not inconsistent with swadeshi.<sup>4</sup> The agriculture ministry announced that it would allow foreign direct investment (FDI) in agriculture; that this is supposed to be swadeshi.

Be it the BJP or Congress, swadeshi and swaraj are deployed rhetorically, not for economic policy. Every government has implemented the globalisation agenda when in power, even if it had criticised globalisation while in opposition. This is evidence of a growing lack of economic freedom and economic sovereignty.

3. Vandana Shiva, 'Arthic Swaraj or Economic Slavery?' *The Observer*, 3 February 1998.

4. Vandana Shiva and Claude Alvares, 'BJP on Swadeshi: the great u-turn?' *Mainstream*, 25 April 1998.

In the process conditions of self-rule, self-governance and self organisation, especially for the countries of the Third World and for the poorest and smallest producers have been undermined. Globalisation is in fact recolonisation and the trade liberalisation policies of the World Bank, IMF and WTO are no different from the free trade treaty of the East India Company which allowed a trading corporation to take over our land.

The 1717 *firman*s granted to the East India Company by Faruksheer Firman, the great grandson of Aurangzeb, and addressed to the Governors of Bengal, Hyderabad and Ahmedabad, were recorded as follows: 'Dilly, January Anno 1716-17. A translate of three Phirmaunds granted to the Right Hon. English East Company for a free trade, by Faruksheer King of Indostan.' The language and concept of free trade was, therefore, central to the East India Company policy for laying the 'foundation of a large, well-grounded, sure English dominion in India for all time to come.'<sup>5</sup>

**T**he dominant thinking of the Indian elite views globalisation and trade liberalisation as a miracle cure for poverty at a time when the high cost and vulnerability of economic globalisation have become visible through the South East Asian crisis. It views globalisation and foreign direct investment as a recipe for economic freedom at a time when entire economies are being taken over and recolonised by western powers.

The South East Asian countries carried out all the steps prescribed in the globalisation recipe. Today, their banks and financial institutions, their industry and natural resources, have been taken over by western banks and

5. Vandana Shiva, *The East India Company, Free Trade and GATT*, 1994.

transnational corporations. In a recent article, Gerald Segal, Director of the International Institute for Strategic Studies in London, stated: 'After the fall of the Berlin Wall and the collapse of the Soviet Union, we spoke of a post-Cold War world. What we can now foresee, amid Asia's financial crisis, is a period dominated by the West.'<sup>6</sup>

**T**he western powers and their strategists view globalisation as recolonisation of the countries that became independent from western colonial rule half a century back. Today the political parties, including the Congress, which had played a key role in our movement for Independence, have adopted this agenda for recolonisation in its election manifesto. What is worse, it calls this new arrangement for economic slavery *arthic swaraj* or economic freedom. The recipes for *arthic swaraj* are neither informed by the economic reality of India, nor by the lessons and experiences from other parts of the world. They are literally lifted from the Bretton Woods institutions and their prescriptions for trade liberalisation and economic reforms.

The South East Asian crisis has been created precisely by financial liberalisation and economic deregulation. The consequence has been a total takeover of the economy through the currency crisis and the IMF programme. Foreign banks and companies are already going through the wrecked economies and buying up local assets and institutions at throw-away prices. This is the same package that the Congress is trying to sell to the Indian people as economic swaraj but which has only one outcome – total economic bondage and economic takeover.

6. *International Herald Tribune*, 27 January 1998.

The *Wall Street Journal* reported that the restructuring of Thailand's financial system is expected to result in foreign majority ownership in many of the country's 15 commercial banks.<sup>7</sup> In Korea too, the IMF required that foreign investment in the capital markets be liberalised and direct foreign investment procedures simplified and made more transparent. Foreign entities will be allowed to buy 50% of the equity of a listed Korean company by end 1997 and 55% by end 1998, paving the way for foreign takeovers of Korean firms.<sup>8</sup>

**W**hen the election manifesto of a major party in the country states that the threat of foreign takeover no longer exists, that there is no enemy outside, only an enemy within, and hence the concept of swadeshi is no longer relevant, it is either ignorant about the state of the world's economy or deliberately misleading its potential voters. If it is the former, it is unfit to rule; if the latter, it is guilty of being anti-national. Instead of learning from countries which have implemented trade and financial liberalisation and are today in deep crisis as a consequence, promoters of globalisation repeatedly state that we must not be afraid of the world.

To be aware of the consequences of liberalisation on the basis of the South East Asian disaster cannot be interpreted as fear; blindness to facts is not fearlessness, it is foolhardiness. To put your hand in the fire and insist it will not burn is a sign of stupidity, not smartness. The volatile global economy is like a fire, and it 'burns' livelihoods and national economies. Integration into it without caution and some limits is not a cure for poverty, it is a cause for poverty.

It is not a cure for unemployment, it is a recipe for unemployment on an unimaginable scale. The extent of unemployment in Thailand and Indonesia as a result of the crisis today stands at 4 million. In Korea and Malaysia prosperous workers are suddenly on the street.

South East Asia is looking towards India for finding models that provide economic alternatives. The concept of swadeshi is even more relevant today than during the independence movement. It is the key to genuine economic freedom in a period of economic totalitarianism dominated by World Bank, IMF, WTO and TNCs. Swadeshi leads to arthik swaraj. Arthik swaraj without swadeshi is like a building without foundations. It will collapse.

**E**ven though we have the colonialism of the past and recent experience of globalisation as recolonisation, many commentators continue to refer to globalisation as economic freedom and equate swadeshi with the past fifty years of the Nehruvian model. Gurcharan Das says, "There is nothing new about swadeshi, we have practised it since independence and "swadeshi will bring back the license-permit raj".<sup>9</sup> However, swadeshi is an *alternative* to Nehruvian socialism based on centralised state power and the usurpation of the functions of the community by the state. Swadeshi is people-centered, not industry or government-centered.

Sharad Joshi in his article, 'Swadeshi: the third battle', has also equated swadeshi with the Nehruvian rather than the Gandhian legacy. Joshi goes even further to suggest that swadeshi means isolation and India has been isolated for thousands of years. 'The swadeshi brigade is in

power now. It would try to set back the clock and go back to a closed India. It imposed isolation in India for thousands of years. It succeeded in keeping its domain despite the British. It succeeded again 50 years back under the banner of socialism, and hopes to succeed this time once again."<sup>10</sup>

**H**owever, India has been a more open society than any other, welcoming guests and integrating cultures. What seems to be common to these critics of swadeshi is that they equate globalisation with freedom and nationalism with slavery. Our magazines and newspapers often refer to *swadeshi* vs *videshi*, and describe swadeshi as a form of xenophobia. This is a false dualism and a distortion of the meaning of swadeshi. Globalisation is the real xenophobic project because it extinguishes all diversity, it devastates autonomous small producers. It is a project of total control arising from a fear of everything that is alive, free and autonomous. In fact, intellectual property rights, which are central to the globalisation agenda are based on a racist view of knowledge. This racism allows the appropriation of indigenous knowledge, as in the case of bio-piracy of neem, turmeric, basmati, pepper and so on.

Globalisation also breeds xenophobia by creating massive insecurity, which in turn breeds fear and violence among communities and societies. Ethnocide and ethnic cleansing are the gifts of global economic integration which robs people of their basic securities.<sup>11</sup> The concept of swadeshi is not based on the fear of the foreigner.

10. Sharad Joshi, 'Swadeshi: the third battle', *Business Line*, 29 April 1998.

11. Vandana Shiva, *Biopiracy: The Plunder of Nature and Knowledge*, South End Press, USA, 1997 and RFSTE, New Delhi, 1998.

7. *Wall Street Journal*, 5-6 December 1997.

8. *Reuters*, 5 December 1997.

9. 'The Fatal Charm of Naturalism', *The Times of India*, 24 April 1998.

It is based on self-organisation and on the recognition that economically powerful global forces are taking over the economic and political structures of our society and hence threatening the livelihoods and freedoms of the people.

**S**wadeshi is based on the recognition that self-organisation is the basis of freedom. Since self-organising systems are autonomous and self-referential, though not insulated from others, they are at peace with themselves and interact under conditions of freedom and peace. A self-organising system knows what it has to import and export in order to maintain and renew itself. It needs nothing else but a reference to itself. It interacts with its environment, but autonomously. The environment only triggers the structural changes; it does not specify or direct them. It is the living system which specifies its structural changes and which patterns in the environment that trigger them. At the political and cultural level, it is this freedom to self-organise that Gandhi saw as the basis of interaction between different societies and cultures. 'I want the cultures of all lands to be blown about as freely as possible, but I refuse to be blown off my feet by any.'

The Chilean scientists, Maturana and Varela, have distinguished between two kinds of systems – autopoietic and allopoietic. A system is autopoietic when its function is primarily geared to self-renewal. An autopoietic system refers in the first place to itself and is, therefore, called self-referential. In contrast, an allopoietic system, viz. a machine, refers to a function given from outside, such as the production of a specific output.<sup>12</sup> Swadeshi, in scientific terms,

refers to the building of autopoietic systems as the basis of our cultural, economic and political life.

Globalisation is an example of the transformation of autopoietic systems into allopoietic ones. Globalisation is not the cross-cultural interaction of diverse societies. It is an imposition of a particular culture on all others. Nor is it the search for ecological balance on a planetary scale. It is the predation of one class, one race, and often one gender of a simple species on all others. The 'global' in the dominant discourse is the political space in which the dominant local seeks global control. It frees itself from local, natural and global control and responsibility and limits arising from the imperatives of ecological sustainability and social justice. The global in this sense does not represent the universal human interest; it represents a particular local and parochial interest and culture, which has been globalised through its reach and control, its irresponsibility and lack of reciprocity.

**S**wadeshi is an anti-colonial concept, not an anti-foreigner concept. It is not about people who are outsiders – it refers to structures of power which colonise both internally and externally. It is not xenophobic, it is liberatory because it arises from a spirit of freedom, not the basis of fear.

When the rights of farmers to save, exchange and evolve seed are denied, when the rights of consumers to safe and adequate food are denied, what we have is totalitarianism of a most basic kind, since it is a totalitarianism based on the total control over the vital necessity – food. Swadeshi and satyagraha are the only paths to reclaiming citizen freedom in

this context of economic totalitarianism.

A society in which the only citizens with rights are corporations and their rights are so absolute that they can totally extinguish citizen rights, is not a free society. It is corporate totalitarianism created through free trade arrangements. Economies in which most people are rendered dispensable, and in which most people cannot meet their basic needs, are not free economies for the people. They are free only for capital. Building free societies and free economies implies, above all, putting people before capital. The liberation of people is different from the liberalisation of trade. In fact, trade liberalisation is based on either the dispensability of people or their enslavement.

How do we build alternatives in the context of this totalitarianism of a new kind – a totalitarianism based on the rule of fictions rather than the gun boat, a totalitarianism built on dispensability of the majority rather than their bondage, a totalitarianism in which there is no dictator, no person, no government, but all-pervading corporations which are themselves a legal fiction?

Non-violence requires a withdrawal from participation in violence. The first step in rebuilding free societies is to recognise that globalisation is not a natural phenomena, but an exercise of absolute power for total control. It is a new kind of totalitarianism in which corporations as rulers are attempting to gain total control over life itself, domains that have so far been beyond the control of the market or the state.

The second step in a non-violent search for freedom is to begin to reclaim our self-organising capacities as citizens and communities. This includes non-cooperation with the systems of control that deny us our self-organising capacity. Just as in

12. Humberto R. Maturana and Francisco J. Varela, *The Tree of Knowledge: The Bio-*

*logical Roots of Human Understanding*, Shambala Publications, Boston, 1992.

agriculture, the shift from chemical to organic farming requires freedom from external inputs by building up internal inputs on the farm, in society, a shift to freedom requires becoming free of, or less dependent on, the 'external inputs' through which corporations control our lives – through finance, control on knowledge and information, through monopoly control on production systems.

**W**e at *Navdanya*, are reclaiming this freedom for seeds, for farmers, for consumers – through a movement for the protection of biodiversity. We protect seed freedom by protecting living seeds and native seed diversity. We protect farmers' livelihoods by helping them break free of the bondage and addiction to chemicals and poisons and by promoting organic agriculture. We protect consumer freedom by helping healthy, nutritious, organic produce to reach the consumer. For us this is the real swadeshi agenda.

Rejuvenating our knowledge and skills to meet our needs with our own resources and our own capacities is the alternative to the monopoly on life inherent in patents on life. I have often described patents on life as the enclosure of the intellectual and biological commons. The alternative to enclosures is the recovery of the commons – protecting the free domain of knowledge exchange by non cooperating with IPR laws which make knowledge exchange, seed exchange, and biodiversity exchange at the local level illegal. We can only be truly free if our minds are free. Controlling and owning the mind and products of the mind reflects a much deeper slavery than slavery itself. The bodies of slaves were bought and sold, their minds were not. Under the new regime of 'free trade', both the body and mind of the people become tradable commodities, the property of the power-

ful to be bought and sold freely. Breaking free of this slavery requires making our bodies and minds free of the ultimate bondage inherent in patents on life.

We, the Third World people, have had to organise ourselves to define our personhood so that we too can govern ourselves, fulfil our humanity, defend our communities and other species. We know what it is like to be excluded. We need to remember how we organised in the past, how we built democratic institutions and cultures. Corporate rule has excluded all people as persons. It has reduced citizenship to being consumers, and by new mechanisms such as denial of the right to know – especially in the domain of genetically engineered foods – the consumer too is like a captive creature. This corporate fiction has to be treated as what it is – a fiction, which can rule over us only to the extent that we allow it to. The most fundamental human rights agenda of our times is to reclaim our humanity in all our diversity.

**A**n inclusive concept of personhood is also an inclusive concept of freedom since it does not imply freedom of one kind for a privileged part of society but protects multidimensional freedoms for all. We can only become free people if our rights are not extinguished by the rights of the corporate fiction.

All liberation movements in recent history have been partial and exclusionist. They excluded other species and diverse cultures. For the first time we have an opportunity to seek freedom in inclusive ways, in our diversity, to seek freedom for humans in partnership with other species and to seek freedom non-violently. This freedom of, and through, diversity is the alternative to globalisation. This is true swadeshi.

# Trusting our own genius

V. KURIEN

SWADESHI to me means trusting our own genius to handle our own problems in a manner unique to ourselves. This is not something that comes easily to a nation which had been colonised for hundreds of years. It is, therefore, tempting to go back to the years before Independence to recall the flavour of swadeshi as people then saw it. It had noble motives. The economic battle was a necessary adjunct to the political battle for Independence. In 1935, two hundred years of living under foreign masters had sapped the economic will of the nation then about to be born in little more than a decade. Swadeshi came to be understood in the spirit in which it was meant only by those who went to the political battlefield for the freedom they so craved.

It was not, unfortunately, understood in the same spirit by others among us who sat on the sidelines and watched. And there were a large number of those too. The supercilious British remark that something was merely 'swadeshi stuff', was meant to indicate inferior quality and was accepted with alacrity by many among us. Unfortunately, it was also often true. Even after Independence the feeling continued that whatever we produced was just not good enough.

Even our own experts were not good enough. So much so that if we wanted to ascertain quality, we sought the opinions of foreign experts. This may be a good thing to do if we do not have the expertise. On the other hand it may not. We faced the problem early in the life of the fledgling dairy indus-

try when the only way to preserve surplus milk was to convert it into powder. Expert opinion was sought from England and New Zealand. We were told in no uncertain terms that it was impossible to convert buffalo milk into powder. Excellent reasons were given to us. Being a rather unreasonable bunch we decided to give it a try ourselves – and we succeeded in converting buffalo milk into powder.

**I** wonder how many today recall the acute shortage of formula baby food in the market in the late '60s. Earlier, in the 1950s, India used to import large quantities of baby food from England. Many of today's middle-aged gentlemen and women grew up on Similac and Cow & Gate. When the baby food imports were slowly turned off after 1956 it took some time for our industry to gear up. It was during this period that we at Amul were told to get the expertise from abroad to produce baby food in India. I was asked by the Ministry of Agriculture to seek collaboration agreements with the world's best baby food manufacturers. When I went to Switzerland and met some of them I was turned down flat. Our Swiss friends said that baby food could not be manufactured in India. For one thing, it required sterile conditions at a level that could never be ensured in India. For another, they could not trust 'native' managers to run the plants and it would be impossible to run a plant entirely with foreign experts in India.

When I returned empty-handed and told my minister what had transpired, he wanted to know what I proposed to do. I told him that since the Swiss were so convinced that it could not be done, and they had excellent reasons, we, who were unreasonable people, would go ahead and produce the baby food for the Indian market. Thus it was that Amul Baby Food

swept the market. It was only then that the Swiss sat up, took notice and sought permission to manufacture baby food themselves in India. What was impossible suddenly became possible. It made us understand that the opinions of foreign experts on any subject of importance to India are dictated by the economic interests of the countries they come from. So long as they coincide with our interests the advice is likely to be valid. If they come into conflict with the interests of the adviser's home country he will offer advice to suit his country's interests, not ours.

There is thus a realistic side to swadeshi. There are many things that we know nothing about. The expertise exists abroad. We should have the understanding to first know what it is that we have no knowledge of and the humility to seek it from another country if necessary. There are many areas, however, in which we have perfectly good expertise, often better suited to our own conditions. We should be able to look for such areas and capitalise on that expertise.

**I**ndia is primarily an agricultural country and it will remain so for a long time to come. There is much to learn from abroad about modern agricultural practices. The knowledge can be brought home and used for our own purposes in whatever manner suits our best interests to raise productivity levels. For instance, capitalising on the Green Revolution resulted in our present day self-sufficiency in agriculture. Similarly, by using foreign food aid for our own purposes, we have today become the world's largest producer of milk. The story is worth recounting because food aid could so easily have led to economic disaster.

When Lal Bahadur Shastri, the Prime Minister, visited us at Anand to inaugurate a cattle feed plant, he was

impressed with Amul and suggested that the spirit of Amul should be replicated in other parts of the country. To that end the National Dairy Development Board was formed. But the mere formation of the Board meant nothing. The Board had no money and none was forthcoming from the Government of India. How then was one to go about replicating Anand in other parts of the country? This dilemma stayed with us for some time. We then noticed that the formation of the European Economic Community had resulted in the guaranteed purchase by the EEC of the agricultural produce of the member-nations' farmers. This included dairy products.

**O**ver the next few years the EEC found itself sitting on a growing mountain of milk powder and butter. Now powder and butter costs money to preserve and the EEC had no market in which it could be sold. It was clear that a lot of the powder and butter had to be simply given away. It could not be got rid of in the Americas. The African nations would perhaps be persuaded to accept some of it, but that would be no more than a pinch here and there. The communist East was out of political bounds. That left just two countries with large populations: China and India. But the Chinese do not drink milk. It was, therefore, clear to us at the Dairy Board that one day some kindly gentleman from the EEC would arrive in New Delhi and offer the Government of India milk and butter as food aid. Had we accepted the food aid and distributed it free to our people, our domestic market for milk and its products would have collapsed. The only way this aid could be used was to channel it through a responsible agency which would use the aid in a proper manner.

The Dairy Board, therefore, offered to accept the food aid on behalf

of the government. We reconstituted the butter and powder back into milk and sold it in the market at a price not below the ruling price of milk. We thus protected the market from collapsing and monetised the aid received. Having done so we used the funds generated to build four large Mother Dairies in the four major metros of the country. That was the beginning of Operation Flood. We created the market for milk in the big towns and then proceeded to set up the cooperatives to supply milk from the rural areas to the urban areas.

**N**obody taught us what to do. These strategies were evolved by our people with our genius. The result is that unlike the Horn of Africa, so devastated by food aid, we have been able to convert India into a country that produces more milk than any other country in the world.

I am all for foreign collaborations in those areas in which we lack the expertise. If we do not know how to make cryogenic engines for our Polar Satellite Launch Vehicle, we should get the expertise from abroad. But our native genius is enough to tell us that we do not need foreign countries to teach us how to make fizzy drinks out of coloured and flavoured water and carbon dioxide. Nor do we need foreigners to teach us how to make corn flakes or ice cream. In fact, we make better ice cream in India than do many countries of the developed West.

Besides, it is not true that our own genius cannot solve problems. Take the case of the Cray super computer. After the 1974 Pokhran explosion the Americans placed sanctions on the export of certain 'sensitive' items to India. Among them were super computers. At that time our Meteorological Department was working on models for the forecast of the monsoon, a matter of immense importance to the

economic performance of the country since most of our agriculture depends on the rains. To create realistic models we needed super computers. Since the United States would not let us buy them and nobody else had such powerful machines, the only alternative was to make our own. Our scientists and computer technologists got down to the task and succeeded. Today, a number of countries in Western Europe are lining up to buy Indian super computers because they are just as good as the American ones, they generate less heat because they use parallel processing technology and they cost a tenth of the American Crays.

**R**ecently there was a similar case connected with the Rajasthan Atomic Power Station. The reactor in the station needed a complete overhaul. Since it was made to a design originally supplied to us by the Canadians (CANDU type), the Canadians were approached and requested to carry out the overhaul. They said it would take a long time and cost millions of dollars. The Indian atomic energy establishment then approached the United States and received a similar answer from them as well. R. Chidambaram, (he was then yet to become the father of the Indian hydrogen bomb) then took up the challenge. His team did the job of overhauling the reactor in a matter of months at a cost which was less than that quoted by foreign experts by a factor of twenty.

It must be remembered that no other country owes us a living. It is a jungle out there. We have to live, survive and prosper, in the ultimate analysis, by ourselves and with our own efforts. My personal ideal of swadeshi simply consists of my country never having to look up to anyone else for anything. In essence, therefore, it means having an abiding pride in our own capabilities.

# Interview

with **Adi Godrej**, industrialist by **Ashok Upadhyay**

*What are your thoughts on swadeshi as it is being propounded by the BJP and the Swadeshi Jagran Manch?*

One cannot find fault with a concept that purports to serve national interest; in this sense the concept is essentially, by which one means definitionally, good. The point is how relevant is it to this country's needs at this point of time in its history. To my mind at least the concerns are vastly different than they were when the concept was first invoked. Swadeshi had a deep relevance at the time of our struggle for Independence as a strategic weapon. It united the entire country against an enemy and gave the country's fight a focus. I believed it served its purpose, limited as it was. Intrinsically the concept may still have relevance if you define it as a means to serve the country's interests, to benefit the people as a whole and not some section of Indians. But its application, as it has been historically understood, has grave problems attached to it. This country today needs foreign investment, capital and technology if the country has to benefit as a whole. We should not hinder foreign investment but allow it to come in. But only so long as it helps India grow economically. Of course, the Jagran Manch would say that it is not possible to reconcile the two, that foreign investments would impede growth.

*And would they not be right?*

I would say that they are blinkered to the ways of the world as we see it today. Globalisation is not a phenomenon that you can wish away; the world is far too integrated in terms of capital flows to permit one country to isolate itself from the trend. There is no need for us to believe that we can close our borders to the globalisation that has bestowed such immense benefits on so many developing countries which have prospered as a result. This is what the Jagran Manch people should understand.

*But with foreign investment there is also a threat of domination?*

True and why not I say; if a more efficient company is going to pose a threat to a less efficient one then why stop the inevitable or cry foul so long as the rules of the takeover game are observed. That is not my

worry. My concern is that this country has not provided Indian capital with a level playing field to fight the threat on an equal footing. We are handicapped from the start and that is why the threat of takeover has such ominous overtones. Let me give you an example. Indian companies either in the public or private sector are not allowed to retrench labour. As a result we are burdened with a historical disadvantage when competing with a foreign firm. On this score the latter romps home because it carries a lower cost; at least one component of its operation is already very efficient. As for us, we can do nothing to reduce our costs by introducing new technology if it means replacing labour. Then, of course, there is the issue of buy back of shares; foreign companies are allowed to do that to buttress their position and stake, but not Indian companies. Then again the case of the textile mills in Mumbai, for instance, is particularly bad because they cannot get rid of their debts by selling the surplus land, a factor that burdens them with assets of no use to anyone.

*But aren't you making a case for swadeshi to keep them out?*

No, no I am not asking that the Indian industrialist be *protected*. It's not protection that one wants, like we had in this country for 40 years. What I am asking for are the *enabling provisions*, the removal of the fetters that tie our hands behind our backs. Then we will compete on an equal footing. It is possible that some may die but that is part of the competitive game.

*It all sounds very simple.*

That is the problem; the most simple tasks appear difficult for political parties in power to perceive in terms of a solution. I am not pointing a finger at the present government alone. No previous government since 1991 has looked at the problems facing the Indian industrialist in terms of solutions. To be sure, Manmohan Singh started the process of liberalisation, laying the grounds for the globalisation of the Indian economy. The talk of industrial restructuring began then and continued down to Chidambaram's time and still echoes across the land. But how do you restructure with all the problems that Indian industry faces? Can you restructure your operations without taking a view about surplus manpower?

*Do you think that the BJP with its swadeshi plank can do it?*

I am not sure it can. This government is also a coalition one like the previous ones and I believe that it is as weak in its formation as the earlier ones. The Congress lasted five years, the UF much less. Chidambaram gave us a dream budget but the coalition did not last long enough for him to follow up on the policies he had announced in his first and only budget. If those governments could not make the necessary changes, can this one? I wonder.

*Why not? After all it purports to protect the interests of Indian industry.*

That is the point I am making. The Swadeshi Jagran Manch uses the concept, but it is just that – a concept devoid of any context. It is far removed from the concerns of modern India, concerns that have to do with the need for foreign capital, competition and a level playing field for Indian industrialists. Also, remember, as a coalition it is not entirely its own master.

*You sound cynical or pessimistic.*

Not a cynic but a pessimist yes, but for the short term – not for the medium to long term. The country's fundamentals are strong and our macro management has been very good. We do not face the kind of problems that the South East Asian countries are facing. But you can't expect GDP to grow if the biggest sectors of the economy lie untapped, if the largest assets in this country lie undiscovered of their potential. Take housing. Countries as diverse as Nazi Germany and the USA under the New Deal in the 1930s engaged in housing projects and the attendant infrastructure like roads even though the demand did not precede the development. In China, the basis of the country's phenomenal growth has its roots in the massive inflow of funds into the housing sector. Development there generated demand for other essentials like cement and steel and therefore justified capacities. Surely the Jagran Manch cannot deny the utility of such a development when there are so many of our citizens sleeping on pavements in the metros around the country?

Second, we should open up the insurance sector to foreigners. There is a mistaken notion that they cream away our capital. No, in fact they will help mobilise our savings and therefore boost overall savings and investment in the country.

*But the swadeshi brigade would only want Indian capital.*

Well, you can't dictate things like that; which Indian company would have the resources needed for the sector? You have to allow foreign capital into the country for the housing sector. China did and no one is accusing that country of having bartered away its freedom or sovereignty. We have to be clear that by swadeshi we mean a system or set of policies that are good for the GDP of the country, not for some section of society, be it labour or capital.

*So how do you see 2001?*

That is a decade from 1991. I do not see the country enjoying the fruits of that process begun a decade ago because the transition is not yet over; it has suffered a few setbacks and the current slowdown will take its toll because the upswing may stretch into that year. But, by the same token, I do not think the country will face the kind of crisis it did in 1991 when it came close to being declared bankrupt. So that is all to the good; but the excitement of those early years of this decade is missing and that is a pity because it would be a bad start to a new century.

*Do you think that by then ideology will be dead?*

Well I can't answer that in philosophical terms but I think that concepts like socialism and swadeshi will never die. It seems like just yesterday that the BJP was in opposition as the most vocal and ardent representative of the far right as against the strident socialism of the ruling Congress. Now the tables have turned and the right is in power talks left, a.k.a. swadeshi, and we have the Congress in the opposition as the right with its most vocal factions talking free market. Yesterday, more people in this party swore by socialism; the free marketers were the isolated few. Today it is the reverse. Both have their constituencies even though their numbers tend to fluctuate.

*So what is good governance?*

I am not sure that I can answer that in universal terms. Let me put the issue in terms of economic governance. I think that the sound management of the economy first requires an open mind so as to comprehend the changing world in a more comprehensive way. Global changes transform the definition of national interests and at no time is this change more noticeable than at the present. This is what the Jagran Manch and the BJP must realise, that the nature of national interests has changed and that, in any case, it never meant the protection of sectional interests, be they labour or capital.

# Books

**AGENDA FOR CHANGE: Action Plan for the Economy** edited by Bibek Debroy and Parth Shah. Centre for Civil Society and Rajiv Gandhi Institute for Contemporary Studies, 1998.

ACCORDING to the editors of this volume, the programme of economic liberalisation launched in 1991 has all but ground to a halt, partly because economists have failed to communicate the virtues of reforms to a larger constituency that might overcome the lobbies and vested interests that stand in the way. *Agenda for Change* is the first of a series of volumes that two prominent pro-reform think tanks intend to bring out, 'to get across the message of reforms... in clearly digestible language and form' for the general reader. With its large typeface, sparing use of footnotes, and coloured boxes highlighting salient points as well as summary agendas at the beginning of each short article, the book's form gives no cause for complaint. The substance though is another matter.

There are seventeen contributions covering a wide range of issues. Despite this broad-spectrum treatment, there are major omissions. In their belief that external sector reforms were largely on track (the essays were obviously written before the BJP came to power with a swadeshi agenda), the editors did not invite any contributions on policies towards foreign trade (except in relation to agriculture) or foreign investment. Even if the volume was to be confined to

domestic reforms, it is strange that there is no coverage of macro-economic management: apart from suggestions for curbing subsidies, there is nothing here on the government's fiscal deficit and mounting internal debt, or the structure of taxation, monetary and credit policies. Irrigation, health care, and employment schemes are other topics that are not on the Agenda. These gaps would have been less egregious had there not been multiple coverage of several other issues: two essays each on securities markets, labour markets, and controls in agriculture. One of the latter also has much to say on essential commodities and the public distribution system (PDS), on which there are two other contributions. Similarly, the essay on reforms and poverty is substantially devoted to education, which is also the subject of a separate article.

The authors are all more or less enthusiastically pro-reform, but that does not make for unanimity where their essays overlap. Ashok Gulati calls for free trade or uniformly low tariffs in agriculture, while Ramesh Chand supports discriminating protection. Gulati would substantially dismantle the PDS, while Shikha Jha and P.V. Srinivasan prefer to reform it. Shubhashish Gangopadhyay and Wilima Wadhwa call for wholesale privatisation in power and telecommunications, while Suresh Tendulkar more circumspectly groups public enterprises into categories for complete, partial or no privatisation. This could have made for an interesting debate, if not a coherent 'agenda for

change', but the authors do not engage each other's arguments. Critics of liberalisation are not represented in this volume, and only a couple of the contributors address their concerns.

As for the individual essays, a collective volume of this kind inevitably forces selectivity on a reviewer. Ajay Shah begins on a rather peculiar note, arguing that the supply of savings is fixed, and the role of the financial sector is simply to allocate it efficiently. Thereafter, however, he provides a lucid introduction to the world of financial markets and makes a cogent case for institutional reforms involving electronic trading of shares and bonds and fuller information disclosure by companies. Jha and Srinivasan's nuanced assessment of the PDS commends it for stabilizing food prices and preventing localised shortages, but deplores the high costs of maintaining large grain stocks and the programme's failure in targeting the poor. Based on the experience of other countries, they are aware that attempts to restrict access by the non-poor are subject to a high probability of excluding the poor. Given state governments' pathetic record in identifying needy beneficiaries, they suggest modest ways in which self-targeting can be encouraged: provision of poorer quality, simple packaging, and more frequent disbursement in smaller amounts so as to cater to daily wage earners who may never have enough cash to buy a month's requirements at a go.

Gulati, on the other hand, would rather scrap the PDS altogether, replacing it with food stamps issued to the poor which would entitle them to buy from private traders who would be reimbursed by the government. Although he is rightly exercised by the poor targeting of the existing system and the rampant diversion of PDS supplies to the open market, he does not recognize the much greater scope for abuse his scheme would entail. Controls in agriculture, he believes, are routinely evaded and create opportunities for corruption; they should be abolished. Many of his specific suggestions, such as allowing free import of edible oils to replace high cost domestic production and bring down prices are welcome, but clearly run into insuperable political obstacles.

For the most part, though, he bases his case for decontrol on the need to remove 'distortions' and improve allocative efficiency. This means a lot to economists, but will not be self-evident to the general readership this volume is intended for. Neither is the case for liberalisation popularised by his insouciant admission that many groups and regions will lose out in the adjustment process, and that it may take years

for any rise in agricultural growth to become apparent. At the end, he briefly acknowledges that unless tenurial reforms and complementary infrastructural investment are forthcoming, this growth may not take place at all. But then why does Gulati not argue the case for these measures, which require a more activist state, with as much fervour and detail as his case for decontrol and free markets?

Mass poverty and grotesque inequalities of opportunity should surely be the central focus of any Indian agenda for change. Apart from the consideration the poor receive in the chapters on food policy, there is a general complacency about poverty in this volume, an implicit faith in what used to be called the 'trickle-down effect' of growth. In the only essay that deals with economic reforms and poverty, Amaresh Dubey and Gangopadhyay take it as axiomatic that liberalisation creates economic opportunities and growth, which in turn provides the resources for helping the poor. All that is needed, then, is for the poor to be educated to avail of the jobs a liberalised economy generates. Space does not permit me to challenge this syllogism here. Instead, let me question some of their especially misleading 'factual' observations.

Reporting the results of their own research, they show that female-headed households have a higher incidence of poverty than male-headed households in urban areas but not in rural areas, and that female heads of household have lower literacy rates. From this they conclude (reasonably) that urban occupations require more schooling, but also (unreasonably) that gender bias operates in the family more than the workplace. Second, they make the common mistake of noting the fall in the proportion of population under the poverty line between 1987-88 and 1993-94, and attributing it to liberalisation. The earlier year was a drought year, which pushed up the poverty ratio and thus exaggerated the subsequent decline. Further, the annual rate of decline in rural poverty in this six-year period, exaggerated though it was, was actually less than in the previous decade, and also conceals a sharp increase in 1991-92. The reforms have made an undeniable dent in urban poverty, although employment figures suggest that this has resulted from an increase in casual jobs with higher earnings in the service sector.

Finally, while Dubey and Gangopadhyay are probably correct in asserting that land reforms are politically unfeasible (but then so are many of the reforms outlined in this agenda for change), they are less than accurate in citing West Bengal as an example of land reforms not having 'the desired effect soon enough.'

Several observers with no particular Marxist leanings have noted that the limited land reforms undertaken by the Left Front government have blunted the hard edge of rural poverty and contributed to the building of community assets and participation in governance—and to the highest rate of growth of foodgrains output of any state after 1980. The state government's real failure has been in the field of basic education, where socialist governments in Cuba, Nicaragua and Vietnam achieved much more under far more hostile conditions.

West Bengal's disappointing performance in this area is seized upon by Parth Shah in his essay on education policy. Even the most avid liberalisers seldom question the need for state provision of primary education; indeed several contributors to this volume argue that privatisation of loss-making public sector enterprises and the reduction of wasteful subsidies are necessary precisely to free resources for education. Shah goes much further: he believes that the same factors that make the government incapable of efficiently producing goods and services make it incompetent in running schools. He artfully compares West Bengal's predominantly state-run school system with Kerala, that other bastion of the left, where more than half of rural primary schools are private, and almost half the students in private primary schools are supported by the state.

In a novel interpretation of the Kerala model, he ascribes the state's tremendous successes in education to this combination of public funding and private enterprise. He calls for an end to the 'licence raj' in education, and preaches the virtues of 'choice' and 'competition' in schooling, since private schools, like private businesses, will then have an incentive to serve the consumer. He would link school revenues with performance, with grants being based on students' results in a uniform third-standard examination. The mind boggles at the idea of primary education as a business, and in particular at the prospect of eight-year-olds taking an examination which will determine their teachers' salaries. One can well imagine how such 'incentives' will work in practice.

Space does not permit me to comment on the remaining contributions, which include lucid and informative pieces on labour legislation by T.C.A. Anant, intellectual property rights by Bibek Debroy, and environmental regulation by Amir Ullah Khan. On the whole, however, I do not see how this glossy publication can succeed in its professed objective of mobilizing the supposed beneficiaries of liberalisation, among whom the editors include 'unorganised labour,

small farmers [and] the consuming class.' There is no evidence in these essays that the first two groups will benefit; on the contrary they, and the majority of the so-called 'consuming class', will be hit hard by some of the authors' more extreme proposals, such as the dismantling of the PDS, abolition of export controls on foodgrains, and privatisation of primary schooling. Blind faith in the benevolence of state intervention has failed us, but free enterprise and free markets should not be peddled as miracle cures for India's problems of poverty and illiteracy.

**GANDHI'S VISION AND VALUES: The Moral Quest for Change in Indian Agriculture** by Vivek Pinto. Sage Publications, Delhi, 1998.

IN all the recent excitement about *swadeshi* and self-reliance, partly brought on by the current ruling dispensation's professed desire 'to base ourselves on our roots' and even more by its mis-adventure in Pokhran resulting in sanctions, the focus of economic debate has primarily remained centered on the country's external linkages. In an economy increasingly enmeshed with global trade and investment flows, little attention has been paid to Indian agriculture, except to argue that the free trade principle should be extended to this sector as well.

In such an environment Vivek Pinto's slim monograph on 'the moral quest for change in Indian agriculture' decidedly flies against prevalent opinion. Gandhi, more so his *Hind Swaraj*, is hardly a handy reference for the development theorist. To invoke this text as a practical guide for the regeneration of Indian agriculture, and thereby India, is a courageous attempt. Vivek Pinto with his background in theology and formative years spent with two of the country's more unusual voluntary agencies, is not one to evade a challenge.

Friend's Rural Centre, Rasulia and Kishore Bharti, Palia Piparia, both in Hoshangabad district, Madhya Pradesh are best known for initiating the innovative science teaching programme, at the middle school level. This programme, later expanded by Eklavya, was one of the pioneering efforts at environment based learning. What is less well known is that Rasulia, under its then Director, Sudarshan Kapoor, also experimented with Fukuoka's *One Straw Revolution* – naturalist farming which not only eschewed chemical fertilisers, pesticides and high-yielding

variety seeds but also avoided mechanical tilling. Fukuoka, incidentally, reported yields of rice in his native Japanese village comparable to the best in the world. Overall, the philosophy was to nurture nature as the true provider. One is thus not surprised by Pinto's invocation of Hind Swaraj.

'The root meaning of swaraj is self (*swa*)-rule (*raj*). Swaraj may, therefore, be rendered as disciplined rule from within.... "Independence" has no such limitation. Independence may mean licence to do as you like. Swaraj is positive. Independence is negative.' India's development, according to Gandhi, had to be rooted in its agricultural and community oriented endeavours, while adhering to non-violence, truth and love.

Pinto draws upon six key Gandhian concepts – swadeshi, *aparigraha* (non-possession), bread labour, trusteeship, non-exploitation and equality, and shows how Gandhi implemented these concepts in a practical way as rules for those living in his *ashrams*. These he traces to Gandhi's constructive works programmes, efforts which form not just a basis for a moral critique of development (a phrase Gandhi never used) but as a holistic and realisable approach to life and living.

Much of what subsequently follows, both as a commentary on Gandhi's thought and a critique of India's development strategy, is well-known. Of particular interest is Pinto's exposition of J.C. Kurnarappa's survey and subsequent plan for Matar taluka in Gujarat and what went wrong with Gandhi's experiment at Sevagram, Wardha. While going along with the six key concepts as the bedrock to *sarvodaya* (welfare for all), it is somewhat disingenuous to argue that the Sevagram experiment 'failed' because the residents of the ashram were unable to live up to the ideals enunciated.

Gandhi's perennial quest for a true village republic, for India to stand as an alternative to western civilisation remains, at the end, utopian. His philosophical inability to come to terms with humans as they are – brutish, selfish and capable of unmentionable ugliness – has in reality reduced him to a voice on the margins. Nevertheless, many of his ideas continue to find echoes in the continuing experiments at ecologically harmonious, locally rooted community living arrangements. Pinto's pointing out to the spectacular success of Ralegan Siddhi or Seed near Udaipur does demonstrate that even in a macro political economy gone awry, village communities can still construct for themselves meaningful and productive lives – so long

as they can follow self-restraint, treat both the 'other' and nature with respect, and marry ethics to economics. In doing so they live an alternative.

Harsh Sethi

**TWENTIETH CENTURY IMPERIALISM:  
Shifting Contours and Changing Perceptions by  
Rajen Harshe. Sage Publications, New Delhi, 1997.**

It would be useless, if not untruthful, to pretend that this will be an objective review. I know the author too well not to have been biased in favour of the book even before I started it. I can recall the numerous conversations we have had over the last ten years, most of them about the state of the profession, its decline and fall.

I have taken my time in reading this book and I don't regret it. It is the best survey and overview of the literature on 20th century imperialism that I have read. Though its focus is restricted to leftist theories of imperialism, the analysis it offers is clear-headed and systematic so that the whole subject is rendered comprehensible, even to a layman or non-specialist. What is more, it offers not only an exposition of the major theories, but also critiques them so that each emerges in a balanced, clear, and orderly manner.

The book is divided into six chapters, preceded by an Introduction. Chapter one, 'Imperialism through radical prisms: a critique' is an overview of the strengths and limitations of the radical approach. This is, perhaps, the most valuable chapter in the book because it offers a summary of the entire field. It begins with Lenin's thesis, *Imperialism: The Highest Stage of Capitalism* (1917). In a sense, that became the starting point for all radical views on imperialism in this century. The chapter also touches on Mao's and Nkrumah's extensions of Lenin's ideas. Then the *dependencistas*, or the dependency theorists, are discussed. Finally, the chapter zeroes in on US imperialism which, in a sense, has dominated this century.

Chapter two, 'Neo-colonialism in sub-Saharan Africa', as its title suggests, examines how neocolonialism worked in a specific area. Harshe is an expert on sub-Saharan Africa, having written extensively on it. This chapter locates the postcolonial state in a masterly manner, explaining the dynamics of its continued domination by its former colonial masters. The next chapter, 'Imperialism, intermediate capitalist states and apartheid South Africa', explores what dependency theorists might call semi-peripheral states. South Africa is seen as a prime example of such a 'sub-imperial' state. Other

intermediate states like Singapore, Hong Kong, Taiwan, and regional powers like Brazil and India are also sought to be placed in this framework. Chapter four, 'Gramscian hegemony and legitimization of imperialism' shows how the consent of the oppressed is obtained through various systems of direct and indirect coercion and persuasion. The chapter has an excellent summary of the influential and far-reaching ideas of Italy's communist thinker, Antonio Gramsci. Gramsci challenged orthodox Marxian dichotomies such as base and superstructure, arguing that the latter is not merely determined by the former, but acts independently, often in very powerful ways. There is an excellent elucidation of the Gramscian idea of hegemony, especially as it can be applied to the discourse of international relations. Chapter five focuses on the erstwhile Soviet Union and the complex dialectic between imperialism and emancipation, the contradictory tugs which the Soviet state both experienced and embodied. But, this chapter appears to be considerably outdated given the fact that the Soviet Union no longer exists.

The last chapter, 'Perceptions on imperialism', not only offers a recapitulation of the major points and position, but also shows the great adaptability of capitalism. As Harshe observes, 'capitalism has demonstrated an uncanny knack of embracing diverse political forms at the superstructure level' (243). It survives and perpetuates itself by unleashing 'combined and uneven development'. It is, in the ultimate analysis, a hierarchical system which promotes 'dominant-dependent ties at several layers' (244). That is what accounts for its omnipresence and omnipotence.

A great strength of this book is the enormous amount of theoretical and empirical information that it absorbs, analyses, and re-presents. The wide range of references does not imply a lack of corresponding depth; on the contrary, Rajen has that rare ability to get to the heart of the matter in a few sentences or so. There is, thus, no flab or fibbing. The analysis is incisive, cogent, and coherent. The manner of writing, too, is not just pleasant but accurate. On the whole, this work should be recommended as a model of how social science scholarship should be conducted and presented.

I do, however, have some criticism to offer at the end of so much praise. I was rather disappointed that the book attempted no original theorising but was content with merely restating and explaining other people's point of view. Rajen's contribution lies in understanding and rearranging already available texts and theories. Next time, I hope he is bolder and ven-

tures to offer his own theories and explanations of how the world works.

I was also disappointed that while the book touched on radical and liberal thinking, it failed to engage with Indian thinking on imperialism. Perhaps this was out of the purview of the book, yet I would have been happy if at least half a page might have been devoted to some alternative ways of critiquing and resisting imperialism which India offered to the world. Gandhi, for instance, is conspicuous by his absence. Gandhi, as we all know, speaks of modern concerns, though not necessarily in a modern idiom. To write a book on 20th century imperialism without taking into account the ideas of Gandhi is to me only a sad reflection of the limits of our own academic discourse.

**Makarand Parajape**

**REASONS FOR HOPE: Instructive Experiences in Rural Development** edited by Norman Uphoff, Milton J. Esman and Anirudh Krishna. Vistaar Publications, Delhi, 1998.

**REASONS FOR SUCCESS: Learning From Instructive Experiences in Rural Development** by Norman Uphoff, Milton J. Esman and Anirudh Krishna. Vistaar Publications, Delhi, 1998.

THE titles, particularly the former, appear somewhat quaint. At the end of the second millennium, to appeal for hope does little to bolster confidence in a people wracked by unimaginable despair. It is not as if it was always so. For many of the years after WW II our world witnessed a period of unprecedented growth, accompanied on the average by dramatic improvements in the quality of living. It is, however, equally undeniable that this period of growth in material prosperity and consumption has also seen escalating inequality, both absolute and relative, between regions and peoples. And though the ideas of democracy and participation, as also a regime of rights backed by international law, have spread, so have terror, violence and insecurity.

We all have our favoured theories to explain the 'sorry' state of affairs. Many of them focus on external forces – colonialism, imperialism, the global market – or on 'lacks' – an other-wordly attitude, insufficient killer instinct, individualism – and what have you as excuses for our relative lack of success. Some among us even seek to foreground our difference, our exceptionalism, arguing that 'we' cannot be judged by criteria applicable to others.

I have a simpler explanation. Our failures, particularly in the developing world, are primarily to do with a distorted priority mix. In an unequal world, groups and communities are hamstrung by insufficient control over resources, both material and cognitive, to take charge over their own destinies. Given proper conditions, under inspired leadership and using proper strategies, all across the world, poorer groups have demonstrated the ability to rework their lives meaningfully. The two volumes under review put together by Norman Uphoff and his associates provide ample evidence in this regard.

Uphoff and his colleagues at Cornell University have for over a quarter century been studying rural development efforts in a comparative frame. One major fallout of their labours has been the demolition of the pop theories of essentialism. These studies have demonstrated that while regions, communities and peoples do have their own specificities, they also share common human aspirations and failings, that there are no 'god's chosen.'

*Reasons for Hope*, the first volume, brings together 18 case studies – from Asia, Africa and Latin America – which illustrate how lives of millions of rural households have been improved by purposeful initiatives. Some of these were initiated by governments, others by NGOs. Some had effective donor assistance, others progressed with remarkably few outside resources. Some were conceived by remarkable individuals, others were the product of team efforts or institutional initiatives.

In all cases, however, success depended on sets of persons who saw acutely both needs and solutions, who persevered as they innovated, bringing in ever-increasing numbers into their programmes. Approaches that respect the inherent capabilities, intelligence and responsibility of rural people, and systematically build upon that experience have a reasonable chance of making significant advances. What is needed are organisational capabilities at local levels that can mobilise and manage resources effectively for the many rather than the few. Novel ideas and strong value commitments that outside resources can support, once a significant learning process has been initiated, is what makes for success.

Many of the cases discussed – the Grameen Bank, the Orangi Pilot Project, BRAC, AMUL, SANSA in Sri Lanka, the work of the Population and Community Development Association in Thailand – are familiar, as are the inspiring individuals behind these efforts. Yet, what makes this collection different from many

others is the *emic*, the insider participant view. Understanding how things happen in the words of those 'who made them happen' can be inspiring; more so since the stories are presented not as self-praise but with warts.

My own personal favourite is the Orangi Pilot Project on the outskirts of Karachi. Akhtar Hameed Khan, earlier known as the father of the Comilla experiment, is genuinely an incredible figure. Having cut his teeth as a civil service officer in Bangladesh (then East Pakistan), at an advanced age (he is now over 80) he took on work in a strife-torn immigrant settlement and demonstrated that on extremely low resources urban life in our megalopolises can be improved, of all things through simple sanitation techniques, is a story that demands to be heard. It is another facet that Khan Saheb was in his old age charged by fanatic mullahs for blasphemy, just because one of his poems for children was interpreted by these bigots as insulting to Ali, the son-in-law of the Prophet. But the man and the work continues.

The companion volume, a more conventional *etic* account presents the analyst's view of these efforts. It is interesting that the authors/editors hesitated to use the words success and sustainability because they are so often overblown and could prove fickle. The criteria that they favour are well-being, productivity and empowerment – a happy combination of the internal and external.

Each case highlights the importance of commitments, of generating internal resources, the value of learning, of cooperation and participation, of sequential scaling up and of being able to diversify. All through the key factor remains a learning mode – identifying problems and weaknesses, experimenting, evaluating, and modifying. It is this self-critical posture and self-image that conveys an ongoing search for relevance and excellence.

Interestingly the authors do not locate withdrawal as a crucial parameter. I recollect that in earlier times the favoured word, particularly for external interlocutors, was catalyst; that we measured our success in terms of our ability to move out. Uphoff et al. do not see organisational capabilities as finished products that can be walked away from once they are in place and functioning. Relationships may and should change, but they should not snap. Possibly why an Ela Bhatt, V. Kurien, Raj Arole, Anna Hazare and many others continue an association with their efforts, albeit in an altered capacity.

More than the wealth of detail and nuggets of insights which mark these volumes, what is moving is

their tone and temper. For once the focus is not on how many different ways we get it wrong, but how, in the most trying of circumstances, we can strive to get it right. As a cognitive shift, this is crucial, particularly in societies prone to despair. Second, there is no presentation of any magic formula. Different parameters in different combinations work in different situations. Problems may be universal; solutions are context specific.

Finally, a word of advice to ruling regimes. Slogans of *swadeshi* or *swavalambam* acquire content only if the leadership has respect for the people. Learn to listen before preaching.

**Harsh Sethi**

**WAGES OF FREEDOM: Fifty Years of the Indian Nation-State** edited by Partha Chatterjee. Oxford University Press, Delhi, 1998.

THIS collection of reflections by academics on the past fifty years of Indian history provides a richly opinionated study of the country's development, albeit somewhat narrow in ideological focus. Volumes made up of separate contributions by authors tend to be somewhat uneven both in quality and in coverage. This is no different and the number of times the respective authors cite their own work indicates that there is little that is new in their arguments. Notable academics such as Rajni Kothari and Prabhat Patnaik offer chapters on political and economic development that are incisive but will present little that is new to those who know their previous work. Achin Vanaik and Sudipta Kaviraj offer passionate and perceptive accounts of foreign policy and the culture of democracy respectively. There is an attempt to broaden the scope of the book with chapters on art and the cinema, but these are still 'political' in the narrow sense of the word, and written in such a way as to remove any of the colour and attraction of the subject matter that might distract from the analysis. This is a retrospective study written from a contemporary academic perspective, which means rigour takes precedence over readability.

The title of this book is somewhat misleading, for it does not really tackle the concept of India as a nation-state. It is simply taken as given that India is one, and although there is much in the wide ranging and detailed historical analysis contained in the book that implicitly relates to the concept, the suspicion lingers that the phrase has been chosen more for its vogue in political science jargon rather than for any substantive reason.

The construct of the nation-state is a powerful but essentially elusive one. Powerful because of its evocation of unity and legitimacy; essentially elusive because humans define themselves as much by their differences as by their similarities and hence a nationalistic homogeneity is impossible to achieve. The artificialness of the nation-state does not mean it is meaningless, and much of its power comes because it can be invoked so flexibly and with completely contradictory political ends. So nationalism is at once both everyone's friend and everyone's enemy.

What exists is the state, and the interaction between the state and society determines the political health of a country. One's conception of the 'nation' can be seen to be the lens through which this relationship is viewed, which in turn determines how it is implemented in terms of laws and institutions. This inclusive 'nationalism' accepts ideological vision from communism, to liberalism and regional separatism. As such it adds little to one's objective understanding of politics since the 'nation-state' merely becomes what people say it is, but, since ideas do influence politics, much contextual richness is lost without it. Focusing on the nation-state forces one to relate ideology to how the state and society is actually constructed, and is hence useful in providing a practical test of otherwise abstract ideas and ideals.

India is clearly difficult to view in terms of a 'nation' as something above or apart from the state. Most clearly visible is the huge scar of Partition. In her discussion of the formation of a national art collection, Tapati Guha-Thakurta describes an exhibition of Indian art which opened in London in 1947 offering a 'complete, unfragmented display of what would henceforth be arbitrarily divided as the art of India and Pakistan' (91). Such arbitrary divisions are the foundation of all states and the source of the inconclusivity of nationhood. But defining the boundaries of a state does not solve the problem of the nation-state. The final chapter of this book deals with North East India in which Subir Bhattacharya gives a chilling description of the breakdown of state authority amidst competing and incompatible claims of nationhood, and the failure to establish political units which are acceptable to the people. The intractable problem of the nation-state cannot be defined out of existence.

Hence, when, in his introductory chapter, Partha Chatterjee describes the creation of the nation-state as Nehru's most significant achievement, my interpretation is that Nehru was a key player in the consolidation of the Indian state as we see it today, and acted in a

way which was driven largely by his vision of what the nation-state should be. This vision was of a secular democracy with a strong political and economic role for the central government. But, as Chatterjee points out, the implementation of this vision was not a complete success. Taking, as it did, the instruments of state control bequeathed by the British and accepting, rather than challenging the traditionally powerful land owning and industrial interests, there was 'a contradiction between its modernising aspirations and its commitment to democracy' (16).

This limitation of the Nehruvian state is taken up by Rajni Kothari who, in his chapter on the development of the democratic process, notes that the Congress system, 'while allowing a great deal of internal flexibility and a long period of stable democratic functioning, nonetheless produced a centralised, bureaucratic apparatus that was lacking in effective distributive policies and any sound philosophy of justice' (27). And the economic model at the heart of Nehru's modernising vision is denounced in a typically waspish attack by Prabhat Patnaik, at the root of which he places the failure to seriously tackle the issue of land-reform.

The Indira and Rajiv Gandhi periods are passed over rather lightly, seen essentially as a period of decline in which the worst elements of the system were exaggerated at the expense of the best. This seems to me unfortunate, for particularly under Indira it was the increasingly desperate drive to maintain and develop a united national consciousness and concomitant neglect of effective state institutions, that were largely responsible for so many malign and destabilising activities. Here the faults of the Nehruvian state seem magnified; the over-centralisation, dominance of an extra-parliamentary clique, and rhetorical extravagance bearing little relation to what the government was actually doing. It is the period when the Constitution is amended so as to describe India as a 'socialist' country, but when governmental ideology and practice become almost completely divorced. The evidence is of an attempt to invoke a nation-state that does not tally with how society actually operates.

A glimpse of the ethos of the period – the fear, arbitrariness and the confusion between India/Indira – is given in M. Madhava Prasad's chapter on the cinema, describing the excessive censorship during the Emergency:

'*Kissa Kursi Ka* was refused a certificate because two out of five members of the censor board thought it "was derogatory to the democratic situation". The film was about corruption in politics and included

references to Congress politicians. The revision committee's recommendation of a "U" certificate was also overruled by the chair of the censor board who reported the matter to the Central government' (134).

The government seized all the prints, and when the courts sought to view the film it was declared untraceable.

Which leads on to the post-Congress era, and alternative visions of the nation-state that seek to make sense of modern politics and offer prospects for improvement. Is it possible to build a political movement, or develop a cogent vision of the nation-state, which can cope with the diversity and seemingly contradictory requirements of modern India? The difficulties are immense. In her essay on 'Women and Citizenship', Nivedita Menon describes the tangled principles of secularism, religious tolerance and state intervention that surrounds the issue of a uniform civil code. Even for the womens' movement, which has relatively clear goals, the means of achieving them becomes clouded among the contradictory claims of individual and communal rights.

There is little attempt to either examine or criticise challenges to the Congress state from the Janata Party, Janata Dal or BJP, but two chapters focus on the failure of the communist parties. Both of these hardly acknowledge the performance of the communist parties in power, but discuss on the failure to achieve radical or revolutionary success. What unfolds is a tale of a quite outstanding series of misjudgements by the communist leadership. Leaving aside the splits and tactical revisions resulting from divergent and fickle attachments to the USSR and China, the communist leadership denounced and distanced itself from the euphoria of Independence, and turned its back on the JP movement. The CPI gave support to Indira Gandhi when she invoked Emergency powers, and the CPM failed to denounce the Congress instigated anti-Sikh riots in 1984. An incident described by Javeed Alam sets the scene:

'Preparation[s] were made to launch a railway strike on 9 May 1949, which was to be the beginning of a country-wide working class insurrection. This ended in a fiasco. The workers refused to come out; the cadres were jailed. The leadership hit back by purging the middle ranks for not working seriously to make a success of the strike' (189).

Javeed Alam stresses the failure in leadership; Aditya Nigam, in a reflective and perceptive chapter, a more general criticism of the communists failure to

build a deep-rooted movement that reflected the social needs of the people. He recognises the fluidity of the concept of the nation, that 'the entire post-independence period can be read as a constantly threatened and fragile attempt to go on reinvesting in a pan-Indian identity' (229). His regret (and he writes not only as an academic but a CPM activist for nearly 20 years) is about the failure of the communists to respond to this fluidity and fuzziness and successfully mould it into a coherent radical movement, but which instead saw the increasingly explicitly fractured nature of politics as a threat to 'national unity and integrity'.

This raises a question of whether there is a fundamental flaw in the ideology of communism, in its conception of the nation-state. This contends that communism, in overstating the importance of class conflict, fails to have an adequate response to considerations such as regional nationalism or religion. Further, an organisation which seeks to completely overthrow the whole political order and which represents a class who may not even be conscious that what is being done is in its interest, which is only accountable in as far as it achieves a utopian goal and to achieve this end can use virtually any means, and hence can justify almost any change of tactics as in line with its goals, is by nature prone to instability and authoritarianism.

This is undoubtedly putting an unreasonable onus of consistency and unity on the communist parties, nowadays an isolated and soft target for criticism. All parties compromise, change policies and face splits. All parties are in some way vanguards, that whilst relating to society also try to lead it in some particular direction. Nationalist parties like the BJP can also be characterised as utopian, authoritarian and based on false historicism, but this has hardly been an obstacle to electoral success. The failure of the communist parties stems partly from problems with the leadership and other organisational weaknesses, but also from the difficulty in translating their ideology into practical measures. As Nigam argues: 'Hegemony ... can only be meaningful if the party in question is able to address the needs that move the people into political action' (213). This difficulty is by no means restricted to the communists alone.

Kancha Ilaiah offers a vision of the 'Dalitization of the Nation', which Kothari also seems to share, in which politics is transformed through the politicisation and empowerment of the radical, anti-elitist, anti-hierarchical, secular groupings which are emerging and gain power through coalition formation and acceptance of federal politics. This appears to be a call for

liberalism from below, secular and meritocratic, and willing to challenge the traditional structures of society. The hopeful optimism behind this vision is drawn into focus in Sudipta Kaviraj's chapter, which starts off with a lyrical account of India's romance with democracy, but develops into a more cautionary discourse. He emphasises the enduring ability of the social élites to use formal, and increasingly informal processes—language and education—to maintain their dominance. This societal stasis does not preclude change, but limits its scope. In this light he highlights the dangers of popularist movements which are solely reliant on a politics of insubordination, with their tendency to degenerate into reliance on symbolic gestures, and the dangers of the spread of mediocrity in areas where qualitative discrimination is necessary.

Achin Vanaik's assessment of Indian foreign policy provides the most cogent reformulation of the idea of the nation-state. He takes the collapse of the Nehruvian consensus and the resulting 'deep uncertainty and ideological incoherence in ... foreign policy' (61) as his starting point. He goes on to attack both the actors and the theory responsible for India's foreign policy; berating the dominance of the realist approach to international relations, caught up in an Americanised mind-set, and scathing about the 'national security establishment', describing it as 'a disaster' which 'has been utterly incapable of carrying out the kind of self-questioning which is the necessary step towards genuine and radical rethinking, of recognising its own profound limitations as the putative guardians of India's "national security"' (62-3).

His criticism is directed largely at the prevalence of simplistic conceptions of the 'national interest' and 'national security' which in turn lead to a distorted view of the international system as unified states acting in a vacuum. But both the relationship between the state and society and between state and state are far more complex, and inter-relate in a much more interactive manner, politically, socially and economically. Characterising foreign policy as an interaction between 'us' and 'them' is dangerous oversimplification. Democratisation throughout the world has widened the range of groups and interests that the framers of policy must respond to, and this in turn means that foreign policy can no longer be simply outward looking, but must be sensitive to the requirements of the wider population. But here again, he emphasises the dangers of taking a simple dichotomised approach, in this case as 'internal' and 'external'. There is a recognition that globalisation has ended any possibility of isolationism,

whilst rejecting the capitalist/neo-liberal regime as a solution. This leads him to suggest that '[t]he issue has never been whether or not to reform and globalise ... but how to reform and globalise with intelligence and due caution' (76).

Finally, he sets out the principles and agenda of an alternative foreign policy. Written before the BJP came to power and conducted nuclear tests, it is a devastating critique of the path which the Vajpayee government has taken. The appeal of Vanaik's approach is not simply in its coherent critique of the current theory and practice of foreign policy, but the formulation of an alternative which recognises and responds to the diversity and complexity of society and international relations.

Of course, it is easy for academics to criticise politicians, and particularly a Vajpayee Doctrine which seems to be a three stage programme (i) throw crap at the fan, (ii) attempt to clean up the mess, and (iii) blame the fan. But for a politician what value is a coherent view of the nation-state when there are elections to be won and money to be made? Going nuclear was one of the few policies that could be successfully implemented literally at the touch of a button, and although it may have negative long term consequences, it has certainly proved to be instantly popular. Other practical measures for turning India into the macho, pure and self-reliant nation of BJP ideology are not so simple.

An understanding of the relationship between different views of the nation-state and how society is actually formulated helps to cast light on why certain political movements seem to find it so difficult to implement their programme once in power. The cycle of anti-incumbency voting seems deeply established, but the political response has not been to address the problems of governance, but the route of short-term electoral opportunism. Whether the growing acceptance of federalism and coalition politics provides a framework in which this 'anti-politics' can be harnessed and put to positive effect we have yet to see, although theoretical approaches would suggest that log-rolling and rent-seeking are likely to lead to sub-optimal outcomes.

This book casts a disapproving eye over the last fifty years of politics. It is unlikely that many of the authors feel optimistic about the prospects for the next fifty. In its diverse chapters there is much to reflect upon, and in the analysis of the past it offers much that will help us understand the politics of the present.

### The Ordeal of Love

C.F. Andrews and India  
**Hugh Tinker**

The biography records the life of an unusual man, C.F. Andrews, who came to India as an Anglican priest in 1904 and was one of those very rare personalities who were respected both within Indian nationalist circles and official British ones.

Apart from analysing Andrews' role in pre-Independence India and his fight against oppression in Africa and elsewhere, this biography brings to life very human facets of Andrews' extraordinary personality.

# Extracts

*Reproduced below is a short article by Mahatma Gandhi, 'The giant and the dwarf' and an 'Interview to representatives of Scindia Steam Navigation Company', which have a bearing on the current debate on swadeshi.*

THE reader's attention is invited to Sjt. Walchand Hirachand's letter published elsewhere. It has undergone some corrections in order to represent my views correctly [*vide* pp. 303-4]. The discussion to which the letter refers arose out of the formula that 'there should be no discrimination between the rights of the British mercantile community, firms and companies trading in India and the rights of Indian born subjects.' The formula reads innocent enough but it covers the most dangerous position.

The situation today is this. The Britisher is the top-dog and the Indian the under-dog in his own country. In the administration of the country, the Indian generally is a mere clerk. In business he is at best a commission agent getting hardly five per cent against his English principal's 95 per cent. In almost every walk of life the Englishman by reason of his belonging to the ruling class occupies a privileged position. It can be said without fear of contradiction and without any exaggeration that he has risen upon the ruin of India's commerce and industries. The cottage industry of India had to perish in order that Lancashire might flourish. The Indian shipping had to perish so that British shipping might flourish. In a word we were suppressed in order to enable the British to live on the heights of Simla.

It was not a mere picturesque expression of Gokhale's when he said that our growth was stunted. To talk then of no discrimination between Indian interests and English or European is to perpetuate Indian helotage. What is equality of rights between a giant and a dwarf? Before one can think of equality between unequals, the dwarf must be raised to the height of the giant. And since millions living on the

plains cannot be transported to the heights of Simla, it follows that those entrenched in those heights must descend to the plains. The process may seem harsh but it is inevitable if the millions of the plains are to be equals of the privileged few.

It is to be feared therefore that before we reach the state of equality, the levelling process will have to be gone through. Justice demands this. It will be a misnomer to call the process one of racial discrimination. There is no such question. There is room enough in our country for every British man, woman and child, if they will shed their privileged position and share our lot. They must then exchange the British army and the force of the cities for the goodwill of a whole nation, which is at their disposal for the asking. Our goodwill is the truest safeguard that we can offer to them and I make bold to say that it will be infinitely better and more dignified for both of us.

In the process there will be apparent discrimination felt everywhere. It need not be felt by those who realise that the present is a wrong and unnatural position. To show that no racial discrimination is involved in this demand one has only to state that Indians who occupy entrenched positions behind their British patrons will also be expected to come to the level of their brethren of the plains. The true formula therefore should be this. In order to remove the existing unnatural inequalities, the privileges of the ruling class and those others who have shared them shall be reduced so as to reach a state of equality between all classes and communities.

On the Indian side it must be a point of honour with us to hold British lives and honour as sacred as our own. This does not, need not, mean the ruin of British trade or interest. Those who are resident can rely on their disciplined habits, trained intellect, great industry and powers of organisation to carve out for themselves careers of distinction all the while serving the country of their adoption with the loyalty they have tendered to their own motherland.

British trade where it is not hurtful to India's interest can be placed, when we reach a state of honourable association, on a favoured basis. And an India free from exploitation from within and without must prosper with astonishing rapidity. With growing prosperity, her wants must grow. With her growing wants, must grow also her imports. If at that time Britain is a partner or ally, she may well become India's chief supplier.

That is a dream I should love to realise. I have been party to the settlement for the realisation of that dream. I seek every Englishman's help to enable India to gain that end. My notion of *purna swaraj* is not isolated independence but healthy and dignified independence. My nationalism, fierce though it is, is not exclusive, is not devised to harm any nation or individual. Legal maxims are not so legal as they are moral. I believe in the eternal truth of *sic utere tuo ut alienum non laedas* [use thy own property so as not to injure thy neighbour's].

*Young India*, 26-3-1931  
CWMG, 45, pp. 342-43

4 March 1938\*

THREE representatives of the Scindia Steam Navigation Company had an interview with Gandhiji at Segaoon. They seemed to be worried by the following among a number of things:

1) The discrimination clauses. [In the new constitution under the Government of India Act of 1935.] They cited from Gandhiji's article in *Young India* entitled 'The Giant and the Dwarf' the following statements:

'To talk of no discrimination between Indian interests and English or European is to perpetuate Indian helotage. What is equality of rights between a giant and a dwarf? ...' And again: 'In almost every walk of life the Englishman by reason of his belonging to the ruling class occupies a privileged position.... The cottage industries of India had to perish in order that Lancashire might flourish. The Indian shipping had to perish so that British shipping might flourish.'

Is the shipping not to revive and rise to its full height in a free India?

\* According to *Gandhi - 1915-1948: A Detailed Chronology*, Shantikumar Morarjee and Gaganvihari Mehta met Gandhiji at Segaoon on this date.

2) What are Indian or swadeshi companies? It has become a fashion nowadays to bamboozle the unwary public by adding '(India) Limited' to full-blooded British concerns. Lever Brothers '(India) Limited' have their factories here now. They claim to produce swadeshi soap, and have already ruined several large and small soap factories in Bengal. Then there is the Imperial Chemicals (India) Ltd. which has received valuable concessions. This is dumping foreign *industries* instead of foreign *goods* on us!

3) Then there are companies with Indian Directorate with British Managing Agents who direct the Directorate. Would you call a company with a large percentage of Indian capital and a large number of Indian Directors or the Board, but with a non-Indian Managing Director or non-Indian firm as Managing Agents, a swadeshi concern?

Gandhiji dealt with these points fairly exhaustively in his reply which may be summarised below in his own words.

1) On this point I am glad you have reminded me of my article written in 1931. I still hold the same views, and have no doubt that a free India will have the right to discriminate – if that word must be used – against foreign interests, wherever Indian interests need it.

2) As regards the definition of a swadeshi company I would say that only those concerns can be regarded as swadeshi whose control, direction and management either by a Managing Director or by Managing Agents are in Indian hands. I should have no objection to the use of foreign capital, or to the employment of foreign talent, when such are not available in India, or when we need them, but only on condition that such capital and such talents are exclusively under the control, direction and management of Indians and are used in the interests of India.

But the use of foreign capital or talent is one thing, and the dumping of foreign industrial concerns is totally another thing. The concerns you have named cannot in the remotest sense of the term be called swadeshi. Rather than countenance these ventures, I would prefer the development of the industries in question to be delayed by a few years in order to permit national capital and enterprise to grow up and build such industries in future under the actual control, direction and management of Indians themselves.

3) Answer to this is contained in my answer on the second point.

*Harijan*, 26-3-1938  
CWMG, 66, pp. 389-90

# Communication

11 August 1998

To:

Mr. Muhammad Nawaz Sharif  
Prime Minister of Pakistan  
and

Mr. Atal Behari Vajpayee  
Prime Minister of India

Dear Prime Ministers,

On behalf of more than 200 Pakistanis – scientists, academics, educationists, architects, doctors, editors, engineers, journalists, jurists, lawyers, publishers, teachers, writers, poets, artists, filmmakers, cultural workers, human rights activists, women rights activists, anti-child labour and anti-bonded labour activists, development and environment experts, human resource developers, economists, political workers, students and others – I wish to submit a petition to you against nuclear tests and weapons.

The 28 and 30 May 1998 detonations of nuclear devices by Pakistan, and similar tests conducted by India a few days earlier on 11 and 13 May, pose an incalculable danger and threat to peace and stability in the region. Thus far only the ability to detonate a nuclear device has been demonstrated by both sides. Whether effective delivery systems have also been developed, remains unclear.

If at all these blasts prove anything, it is the horrendous realization that the chauvinistic and jingoistic lobbies in the two countries now have at their disposal the means to inflict irreversible and irreparable destruction and suffering upon the peoples of the subcontinent. The worst imaginable scenario could be that the whole region slips into oblivion in the event of a war involving nuclear weapons, leaving behind enough radioactivity and other lethal agents to menace the health and safety of regions far beyond and for a long time to come.

There is, of course, the argument that the possession of nuclear weapons enhances security and thereby contributes to peace, simply because if both sides possess them then neither can use them with impunity. This is apparently a strong, cold-blooded, rational, argument. However, in the Pakistan-India context it can be shown that such an argument is a bad one. Here are some points to consider:

1. Nuclear weapons may be an effective deterrent against total war, but are useless as a means of preventing small-scale terrorist activities of the intelligence services of hostile countries. It is widely believed that at least since the beginning of the 1980s both sides have been involved in dastardly acts of terrorism against innocent men, women and children. Bombs have been planted in market-places, buses, offices, trains, railway stations and other such places where people congregate in large numbers. As a result, many people have been maimed, killed or simply traumatized. Against this ongoing undeclared war, nuclear weapons are no deterrent. In fact one can suspect that they will only embolden the secret services to intensify their nefarious activities and indulge their sadistic impulses with relish in the vain belief that a large-scale war is now impossible.

2. Low-intensity battles have been going on for years between Pakistani and Indian troops along the cease-fire line in Kashmir. Casualties, including deaths, have occurred on both sides. Nuclear weapons are of no use in deterring such blood-spilling. On the other hand, the assumption that a full-scale war is now impossible may perversely encourage local commanders to accelerate their war games.

3. Nuclear weapons are a deterrent only if the belligerents are in possession of superior technology to monitor the situation and ensure that accidental outbreak of war can be prevented. However, no foolproof technology exists anywhere. As recently as

1995, a stray Norwegian rocket seemingly threatening to enter Russian airspace led the Russian armed forces to alert President Yeltsin. They subsequently determined that the missile was not headed for Russia and called off the alert. As we know, neither Pakistan nor India can claim access to sophisticated technology at present. This greatly increases the chances of an accidental use of nuclear weapons. In the final analysis, nuclear weapons can never guarantee real and lasting peace.

We, Pakistanis (included are persons of Pakistani origin and expatriates), therefore exhort the two governments to seek other ways and means of promoting peace and security. They must focus on the ethical and material well-being of their peoples. It is especially shameful that while the vast majority of the people in these two countries have to wage a daily struggle for survival their governments waste scarce resources on building weapon arsenals. The ancient Indian tradition of *ahimsa* is a part of the common heritage of all the peoples of this region. Many Sufi ideas are also supportive of peace, tolerance and respect for life. The ultra-nationalist and militarist postures of the present regimes, however, negate these humane values. This must change. Relations between Pakistan and India and their peoples should be based on goodwill and a commitment to resolve all controversial issues through discussion and mutual accommodation.

We do not, therefore, find the present policies of the governments of Pakistan and India on defence and security, especially the acquisition of nuclear weapon capabilities, justifiable on any grounds. We also find that the present arrangement that the USA, Russia, France, Britain and China can continue to possess nuclear weapons, arbitrary and flawed. We urge, therefore, the two governments to work towards a global regime dedicated to bringing about the total destruction of all nuclear weapons within a specified period of time, without linking it to their own right to nuclearise. As an immediate step, both countries should declare that they will not embark upon a programme of building nuclear weapon systems.

**Ishtiaq Ahmed** and others

#### CORRIGENDUM

In Seminar (468), August 1998, the article by M. Siddharth, "The legal status of nuclear weapons", footnote 1 on page 69 should be read as Vol. 35 instead of Vol. 25 and footnote 4 on page 71, the number 184 should be read as 166.

## A note from seminar

Dear Subscriber,

We post SEMINAR on the 1st of every month. If your copy does not reach you by the fifteenth of the month, please inform us immediately so that we can send a replacement. Complaint of non-receipt of copies at a later date makes it impossible for us to do anything in the matter.

# Backpage

THERE was once a time when 5 September, Teacher's Day, was celebrated with some enthusiasm. It is a marker of the times that not only do we no longer remember Radhakrishnan, but we do not remember our teachers except, of course, when they go on strike.

College and university teachers all across the country have (at the time of writing this piece) been on the warpath. They are agitating for the implementation of the UGC recommendations, which offer them not only better pay-scales and service conditions (including promotional avenues) but secure for them a higher relative status. The accent, it is claimed, is on the latter. As one of their leaders recently remarked, 'Our struggle is not for wages, it is for respect.'

It can be no ones case that the academia, including the relatively more secure and privileged employees of the higher education sector, is materially well-off. Even more, as one time students or now parents, all of us are aware of the dismal conditions in our teaching establishments – libraries, classrooms, labs and what have you. To meaningfully engage in the educational enterprise of teaching and learning in overcrowded classrooms, often with apathetic students, is clearly difficult.

Nevertheless, we need to question why the teachers' movement generates so little sympathy. Rarely do our teachers, more so their self-proclaimed leaders, bother to ask themselves why they have lost the respect of their students. Surely, appreciation from those they are trying to teach is somewhat more important than parity with Class I officers in the central government? In no college or university across the country do we have reports of students joining their teachers in the struggle.

Is this partly because our teachers have forgotten that the imparting of *vidya*, like healing, is as much a vocation as a profession? Teachers who seek to equate themselves with *babus* lose out on the specificity of their chosen activity. Just think back as to which of your teachers you remember? The ones who come to mind are often not the most brilliant, or even the most recognised, but those who treat their students with affection and respect, who are concerned about them, who have time for them.

In their preoccupation with pay-scales, perks and promotions (not in themselves unexpected or unjustified) our teachers seem to have downgraded their primary function, teaching. Their unionised movement, divided on party political lines, rarely raises questions

related to the sorry state of our libraries or the unavailability of books or infrastructure that might enable them to infuse greater meaning in their work. Worse, they have evolved no code of conduct for themselves.

Rarely do we hear of teachers pulling up their colleagues for not taking their classes, or demanding that they spend more time in tutorials, that they organise extra-mural activities for their students. Nor have they bothered to resist the steady downgrading of higher education.

Take as an example the best-off of our universities, the ones in Delhi. When a former Vice Chancellor of Delhi University proudly remarks, 'At least, our results come out in time,' it is a clear indication that the standards of self-evaluation have sunk low.

Part of the malaise afflicting our higher education system can be traced to the populist demand of treating it as a right. In the best sense of the term, accessing the university system is a privilege which needs to be earned. This is not to argue that citizens should not be provided the opportunity to continually improve their skills and learning. But to demand the right to be taught at all levels can only lead to a breakdown of the system.

Thus, rather than invest in libraries, less expensive books and learning materials, correspondence and extra-mural courses, our academia collaborates in the demand for a continual and reckless expansion of the higher education sector. The result is inevitably a mushrooming of ill-equipped colleges and universities, with ill-trained and harassed faculty, producing poor quality (and unemployable) graduates.

All efforts by the state to introduce a measure of economic rationality in the system – be it through fee hikes, privatisation, reductions of subsidies – are resisted. So are efforts at instilling discipline and quality – seen only as measures to worsen working conditions. When a bloated, inefficient and highly subsidised sector resists structural transformation, it is likely to be treated with neglect, if not disdain.

All societies look towards their teachers for guidance and inspiration. The teachers' movement in the past has often provided lead in, if not the struggles, the debates for a more democratic and just society. They were heard because they were respected. A measure of self-reflexivity, more than protestations of victimhood, may help them recover lost ground.

Harsh Sethi

**Interest calculation to your advantage**

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

**No prepayment penalty**

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

**No annual charge**

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

**No commitment charge**

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan -- not before.

**Processing charge on a 'slab' basis**

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

All investment in mutual funds and securities are subject to market risks and the NAV of Schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. The name of the Scheme does not in any manner indicate either the quality of the Scheme, its future prospects or returns. There is no guarantee that the Scheme's objectives will be achieved. Please read the offer documents before investing.

SISTA SAATCHI & SAATCHI-113R/98 B

This is 3 year old Shreya.  
Her parents abandoned her  
and vanished. If you turn the page,  
you'll do the same.

With no one left in the world, little Shreya doesn't have the slightest hope of facing the future, unless she gets an education. And that's where you come in. To make a dream called

*Nanhi Kali* come true. Through *Nanhi Kali*, you can become the foster parent of a little girl like Shreya.

By giving Rs. 100 a month towards her education, your 'daughter' will be put into school and in fact, you will receive regular reports about her progress including a photograph.

*Nanhi Kali* is a special project of the K.C. Mahindra Education Trust - a Trust set up by one of the most reputed industrial families in India.

A Trust that's been working since 1953 to promote education and enlightenment across the country.

Since *Nanhi Kali* literally means 'little flower', with people like you, we hope to repair the broken petals of thousands of such underprivileged little girls.

So please don't turn the page yet.

Supported by M/s. Mahindra & Mahindra Ltd.

THE MONTHLY SYMPOSIUM POST BOX 338 NEW DELHI 11000

Founder Editors RAJ & ROMESH THAPAR

Journal which seeks to reflect through free discussion, every shade of Indian thought and aspiration. Each month, single problem is debated by writers belonging to different persuasions. Opinions expressed have ranged from Janata to Congress, from Sarvodaya to Communist to Independent. And

the non-political specialist too has voiced his views. In this way it has been possible to answer a real need of today, gather the facts and ideas of this age and to help thinking people arrive at a certain degree of cohesion and clarity in facing the problems of economics, of politics, of culture

# The problem

WHEN looked at from the vantage point of the benighted states of north India, Gujarat comes across as a civilized place. Partly, this is what many of us feel about the India south of the Narmada. All men are addressed as *bhai*, all women *ben*. And all food is sweet, even the *tikha achars*.

The Gujaratis constitute a welcoming people. Outsiders rarely feel out of place. In most major academic/technical institutions located in the state – IIM(A), IRMA, NID, ATIRA, SAC – one comes across outsiders, who often constitute the majority. No Gujarat for Gujaratis, unlike in Shiv Sena’s Maharashtra. No virulent anti-Brahmin movement. No proverbial clannishness of the Bengali. Even the top administrative positions, often sought to be ‘reserved’ for the native, seem open.

It does appear that the political expressions of Gujarati ethnicity remain somewhat muted, at least in relative terms. And this despite the Mahagujarat movement for the establishment of a separate linguistic state. The famous story of how the Zoroastrians, hounded out from their native lands, settled down in Navsari near Surat is reflective of this spirit of accommodation. So is the little known fact that notwithstanding the cultural

memory of Somnath, Ahmedabad reportedly hosts the maximum number of mosques in any city, barring Cairo.

The state and its people claim a tradition of pragmatism – practical and businesslike, adapting easily to new environments. Of India’s many NRI communities, the Gujaratis have done well – in locations as diverse as East Africa, UK and the US. They also display an unusual organisational acumen. From the milk cooperatives of Amul, the associations of informal sector working women of SEWA, to the modern petrochemical complex at Patalganga – there is no dearth of success stories. Why, even Gandhian *ashrams*, now run-down and decrepit all over the country, seem a going concern in Gujarat. Just visit Vedchi.

And yet, not all seems well in Gandhi’s native province. Porbandar, the birthplace of the Mahatma, is a hotbed of criminality and corruption. Its most ‘famous’ resident is a female don, now underground, captured tellingly by Shabana Azmi on celluloid. The walled city of Ahmedabad has its ‘Berlin Wall’ dividing the Hindu and Muslim settlements. The residents proudly show visitors the place from where they stone their neighbours during riots.

As for those who see 6 December 1992 as the darkest day for ‘secular’ India, a visit to the Bohra town of Siddhpur would be instructive. Well before the Babri Masjid occupied public attention, the mosque at Siddhpur (itself on the site of the 7th century Shiva temple of Rudramaal) was razed to the ground. In the ruins, under control of the CRPF, the guardians have consecrated two small Shiva temples. Their major grouse is that they were restrained from completing their task.

Other anomalies strike one. The state has a marked presence of women in civic life, at every level. It is not an unusual sight to come across women moving around freely, even during late hours. Yet, the state matches north India in the incidence of atrocities on

women – particularly within the household – bride burning, female suicides, and a proliferation of amniocentesis clinics. Gujarat has also bequeathed to the country the institution of *maitreyi karar*, contract marriages between rich men and poor women.

Some analysts argue that the formation of the separate state of Gujarat marked the beginning of the end, more so after the split of the Indian National Congress in 1969. That year also witnessed the first of the many communal riots which rocked the state after Independence. Subsequently, the political landscape has been vitiated by the Navnirman movement, major anti-reservation stirrs directed against dalits and tribals, and now the anti-minority campaigns spearheaded by the VHP and Bajrang Dal. Pragmatic politics, unmediated by a civic culture that can accommodate the validity of the other, recognises few limits. The hate campaign run by all the political establishments against the Narmada Bachao Andolan has few parallels.

Evidently, present-day Gujarat has little in common with the nostalgic descriptions provided by K.M. Munshi or the concerned and accommodative spirit of its famed *mahajans*. The early industrialists – the Sarabhais and Lalbhais – were not just enthusiastic supporters of the freedom struggle, they set up major educational and cultural institutions. They also took great interest in maintaining the civic space. The current leading industrial houses, though Gujarati by origin, are often headquartered outside. Gujarat for them remains primarily a business site.

Even the famed organisational ability of the Gujaratis seem to be fraying. Both the Surat epidemic and the recent cyclone that devastated coastal Gujarat revealed major lacunae in the state's capacity to manage disasters. The thousands of NGOs too were of little help.

As Gujarat readies itself for the next millennium, it may well need to re-invent itself. The proud claim of

having attracted the largest amount of private capital, both domestic and foreign, has to be set against major infrastructural bottlenecks. More than power, roads, rail networks and telecommunications, the new complexes, mainly chemical, can play havoc with the fragile ecological base. Most of Gujarat is drought-prone, and indiscriminate use of deep-bore tubewells has pushed the water tables dangerously low. Pollution levels are alarming, and the civic infrastructure has all but broken down.

Even more crippling is the state of its intellectual capital. While the ITIs are reportedly well run, the universities and colleges are marked by an increasingly provincial outlook. The university at Baroda, once famous for its many luminaries, is now known primarily for its school of art and the college of social work. Not quite designed to prepare for a new globalised and competitive environment.

Most troubling, however, is the spectre of industrial and social unrest. Labour-capital cooperation, exemplified for instance by Majoor Mahajan, the textile worker's union set up by Gandhi, is unlikely to work in the new industrial environment. Similarly, the desire to keep the dalits and tribals in their place is under challenge from a new subaltern assertiveness following the anti-reservation stir.

Raojibhai Patel (Mota), a legendary teacher of Baroda University, when exasperated often remarked, *junoo kashu bhulvu nahin, navu kashu shikhu nahin* (don't forget the old, learn nothing new). The danger is that the emerging Gujarat with its provincial, middle class, upper caste Hindu restrictive outlook seems to have forgotten even the old. Without a recovery of its one-time welcoming, accommodating and adaptive culture, the Gujarat of the 21st century is unlikely to be a nice place to know.

This issue of *Seminar* explores these and other questions.

# Not a nice Gujarati to know

MEGHNAD DESAI

BARODA, where I was born in 1940, was a bilingual town. The rulers, the Gaekwads and their relations, spoke Marathi while the bulk of the population spoke Gujarati. The Marathi speaking people, many of whom were friends, co-students and colleagues at various age levels in our family, were called *dakshanis* by us. They all spoke good Gujarati and we knew a few words of Marathi. By 1950 our family moved to Bombay (as it was then called) and we reverted to minority status as Gujarati speakers in a Marathi (but also Hindi, Sindhi, Tamil) speaking city.

My consciousness as a Gujarati has thus been forged in a cosmopolitan atmosphere, all the time tempering Gujarati chauvinism. Had we for example been in Ahmedabad or Surat, I may not have had that advantage. Or indeed had the family stayed on in Baroda itself, my upbringing would have been far more provincial.

My consciousness of being a Gujarati was, of course, like that of many other Indians, filtered through *jati*. Being a Nagar (a subcaste of Brahmins), we had the feeling (right or wrong) of belonging to an elite,

what with many Nagars counted among the literati of Gujarat. Such feelings were stronger while in Baroda but then there was a strong concentration of Nagars in one *sheri* (Chitaniya sheri) of Baroda. We lived away from there but that was the ghetto where the aunts and uncles lived.

A more general consciousness of being a Gujarati came from reading K.M. Munshi's novels. It is hard now to describe what a thrill it was to read *Gujarat No Nath*. Almost everyone I knew in my family circles had read it more than once. I probably first read it when I was seven and then every now and then yet again. Munshi's history of Gujarat is of course a total concoction but I was not to know that then. The sheer power of his style, his ability to build up Patan as some great capital city, the grandeur of his characters – Munjal, Kaak, Kirtidev and Manjari – made me proud to be a Gujarati. The other two books of the trilogy were not of the same class but *Gujarat No Nath* is, in my view, still a world class novel.

This was tempered by other readings. The novelist R.V. Desai was

a great friend of my *nana*, Jayakarlal Majmundar, who was a great influence in my childhood. I often accompanied him on his evening walks which ended up in R.V. Desai's garden somewhere near the Kaptan grounds in Baroda in the early 1940s and then somewhere near Rajlaxmi cinema later. Walking long distances was my grandfather's fancy and I joined him early on. I came to read Ramanlal's novels somewhat later. His style of being a Gujarati was much more subtle, much more socially progressive than that of Munshi. His later novels – *Zanzavat*, *Pralay*, *Balajogan* – were staple readings in the family and they were discussed as well. Ramanlal was almost a Gandhian but with a romantic, socialist streak in his writings. He was a high-ranking official of the Gaekwar Sarkar – a *Suba*. Yet, he found time to write a large number of novels.

**C**ultural activities were part of growing up, partly as an excuse for the young to meet each other and partly so that the Nagars could parade their vaunted superiority. Many I knew wrote in an amateur fashion – plays, short stories, poems and comic pieces. Plays would be staged once a year by the Nagar Seva Sangh which we all had to attend. My sister and brother, who were in their teens while we were in Baroda, probably had more fun than I did.

Baroda was a little gem of a town in those days, not the ugly polluted industrial city it has now become. We lived at a crossroads on Palace road across from the Khanderao market which was properly built up with concrete pavings early in my childhood. There were gardens in front of the market and in the evenings people came to sit there. Baroda Radio was broadcast from the Municipality's buildings in front of the market. The

lights would come on at dusk and illuminate the statue of Khanderao resplendent in his royal military garb. My middle brother would often take me there to play.

**B**ombay was a world away from all this. We first stayed with an uncle in a Dadar *chawl* and subsequently moved to a remote bungalow in Versova in the monsoon of 1950. Finally we shifted to a new government housing colony in Worli. I went to a school in Dadar where the medium of instruction was Gujarati. It didn't function too badly in those days. The school had no proper building and operated from the second and third floors of a small residential *chawl*. In those days Dadar was a predominantly Marathi area, so all of us quickly picked enough of the language to get by.

Yet, the atmosphere of reading and discussion flourished as ever at home. I read other Gujarati novelists – Dhumketu, Petlikar, Pannalal Patel and even G.M. Tripathi's monumental *Saraswatichandra*; also the translations of Marathi and Bengali novelists – V.S. Khandekar, Saratchandra Chatterji and, of course, English novels. Bombay being multilingual, especially Worli, I soon got to know many South Indians and my horizons began to expand. I began to be less and less Gujarati.

When I joined college, I chose Ramnarain Ruia College because my middle brother, the one who took me to the gardens in Baroda, had studied there. Matunga, where the college was located, was very mixed – mainly South Indian but also more Gujarati than both Worli and Dadar. However, in my second year I decided that I would swap Gujarati for Additional English as my language paper. This was a conscious decision to define myself, not as a Gujarati, but as someone more cosmopolitan. It caused a

bit of a stir but then I compensated for this decision by agreeing to help start up a Gujarati wallpaper which we published every term. It was called *Asmita*, showing the Munshi influence after all those years of reading him. Though I was active in theatre, I chose to translate and adapt Ibsen's *A Doll's House* rather than select any standard Gujarati one act play. All this was for the inter-collegiate one act play competition which the Bharatiya Vidya Bhavan's Kala Kendra organised every summer.

**T**hrough that I got to know a few young (though older than me) playwrights such as Tarak Mehta and Prabodh Joshi. Though this strengthened my Gujarati cultural influences, I continued to remain awkward and as un-Gujarati as I possibly could be. I acquired a bit of a reputation for having read many English authors, especially playwrights, who were being scoured for possible translations. In college I made many non-Gujarati friends most of whom were into English or sometimes Marathi literature. I regularly used the British Council library and soon started reading contemporary English writing, sometimes pretentiously so. Names like Aldous Huxley, Stephen Spender, Louis MacNeice were bandied about. I read Colin Wilson's *The Outsider*. Reading in the Bombay University's superb library, I discovered not only Ibsen but also more esoteric authors such as Andre Gide and Jean Cocteau. I was determined to be as unlike my fellow Gujarati students as possible.

Why this was I don't know. At home we never were *pucca* Gujarati chauvinists in any case. During the Samyukta Maharashtra agitation, as a family we took the view that Bombay, indeed, should go to Maharashtra. As Bombay state stayed bilingual after the linguistic reorganisation of states,

even though the agitation continued, I never changed my mind. When, however, the Mahagujarat Parishad started its agitation I was left without any great patriotic feeling. I remember an uncle asking me when Gujarat state was formed in 1960 if I was going to offer myself to serve Gujarat. I gave him such a withering look that he immediately said, 'For you perhaps even India is too small a stage on which to dedicate yourself.' He was right, but even I did not know then, how right.

The Gujarat I like is the Gujarat of literature, the decent Gujarat. I also like Gujaratis in small doses – family gatherings or a few friends talking together. The Gujarat of money, of religiosity, of pretended respect and love, and of rank hypocrisy in relations I loathe. Large public meetings, readings of the *Geeta* and worship of Swamis I avoid as much as I can, though having now become a semi-public figure, this is getting harder. But then it is not Gujarat alone that is marked by these traits. Most of India is similar. Such encounters I escape from even to this day in London. I am not part of the diasporic scene in Britain. My Gujarati friends can be counted on the fingers of a single hand. I remain as I was all those years ago – awkward.

**B**ut then nowadays Gujarat itself has become ugly. In the 1950s and early 1960s, it was a tolerant, polite, civilised and cultured place. I recall that when I returned to Bombay, the first of many times in 1965, my elder brother showed me notes from a lecture series that Umashankar Joshi had delivered at the SIES college in Sion. They described an eternal, beautiful Gujarat, a gentle, non-violent, inclusive society. Gujarat has over the last 30 years become a nasty, violent, intolerant, communalist place. While Ahmedabad, was once famous as the

seat of Gandhi and Umashankar Joshi, it is now known for anti-Muslim riots. Surat, once a beautiful place, has disgraced itself in the same way. Even Baroda has had its share of anti Muslim pogroms. Of course, there are a few good people who are struggling to maintain sanity – SETU for example, in Ahmedabad. Yet the majority of Gujarat, especially the affluent Hindu middle classes, have so changed that it is difficult to be proud of them.

**G**ujarat is richer in money. Gujaratis all over the world are successful in making money. But of late, especially since the BJP captured the imagination of the Gujarati middle classes, it has become harsh and violent. Of course, in this it follows India. But even abroad the same trends prevail. There are *gurus* and *swamis* who come through London and people display their religiosity with the same fervour that they show for their latest car or music video. Religion seems to have become a consumer durable to be purchased with black money. God is worshipped in large social gatherings, in much the same way as the British go to soccer games on Saturdays, as a consumption display event.

I suppose I shall never be a good Gujarati. I was not one in my teens and I am not now. Yet, I feel that I carry a Gujarat or indeed an India inside me that I would love to live in. It is a gentle, tolerant, cultured place. I knew it once. But then, perhaps it is only nostalgia playing tricks with my memory. Who today would believe that the poet who wrote those memorable lines about there being a Gujarat forever, wherever there dwells a single Gujarati was a Parsee. Perhaps the BJP and the Bajrang Dal will yet agitate to erase the name of Ardeshar Framji Khabardar from the list of Gujarati poets.

# An unending struggle for Gujarat's political soul

HARISH KHARE

Take One: 9 October 1992. Ashram Road, Ahmedabad's busiest thoroughfare. Early afternoon. Shots are heard. One dead. The victim is Rauf Valliullah, a general secretary of the Gujarat Pradesh Congress Committee. The street talk is that Valliullah had to pay with his life for his audacity. Valliullah was ill-advised to have allowed himself to become the most vocal critic of the then chief minister, Chimanbhai Patel. Inconvenient political rivals could be put away with impunity. That, too, in the much-talked about 'Nayya Gujarat'.

Take Two: 20 July 1998. Campus of the School of Planning and Architecture in the University of Gujarat. A fresh batch of students have arrived on campus; some are getting a taste of the tradition called ragging. All part of a familiar scene this time of the year. Gentle fun; friendly hustle-bustle of old friendships being renewed and new acquaintances being made. Suddenly a posse of 50-60 young men muscle their way in. With the self-assurance of the toughened hooligan; they break-up the revelry, scatter the

furniture and break a few heads. They disapproved of the un-Indian practice of ragging. Inconvenient ideologies and practices can be put down with a rough hand. This too in the newly-promised 'Nutan Gujarat'.

The two episodes, though six years apart, provide a snapshot of the aberrations that tend to crop up as Gujarat copes politically with deep and abiding changes and transformations, economic and social. The old status quo is under challenge by new assertive forces, and the market and technology have permitted the bypassing of the available mechanisms of authority. If there is a quality of unsettledness to Gujarat's political scene, it is only because of a four-decade old agitational habit of mobilization. Every decade has seen at least one major, prolonged agitation; each tapping dormant sentiments, unfreezing a few inhibitions, liberating new forces and groups, culminating in a new collective dynamic vibrancy. The political leaders had no choice but to devise processes and fashion institutions to harness the new vibrancy.

The state itself was born out of a long mobilization, the Mahagujarat agitation, which tapped Gujarati pride; the middle classes joined hands with the business and literary establishments to establish a new state. The 1970s saw the nurturing of the finest civic impulses in the Navnirman agitation, a successful demonstration of 'lok shakti' as student power, youth energy and oppositional forces came together to bring down a corrupt political regime. The 1980s witnessed the anti-reservation agitation, bringing into open the incipient inclination towards social intolerance and at the same time uncorking the suppressed aspirations and ambitions of the underclasses. The resulting clash was violent and remains far from settled. The 1990s witnessed the Ayodhya mobilization, carving out a solid, amalgamated Hindu constituency, pushing the minorities into psychological and geographical isolation.

This tradition of unsettled settledness, with its emphasis on an unsatiated appetite for occupying the opposition space, provides the overarching context to the exacting requirements of governance, with its accent on order, authority and law.

**T**his tradition of dissent, defiance and disagreement has acquired a sanctity of its own, and is forever competing with the obligations of hierarchy and discipline. This tradition of defiance and assertion finds sustenance from two other sources. First, the strong and entrenched tradition of cooperatives, construction activity of the Gandhian variety, the newer non-governmental organizations combining to help preserve an autonomous space of civil society. This habit – by now a paying proposition – contributes to a mindset of non-dependence on the state and its agencies. Civil society in itself has a reservoir of tal-

ent, skills, resources and personnel which could at any time be placed at the disposal of an oppositional movement.

Second, there is a strong streak of anti-Centreism in the Gujarati mind, a hang-over from the struggle against the British. Later perhaps, it became an unconscious legacy of the clash between Sardar Patel and Jawaharlal Nehru; the centre being identified with the Nehru-Gandhi dynasty, and the Gujarat political establishment owing its loyalties to the Sardar and his political legatees.

Each of the four agitations in the four decades since the birth of Gujarat as a separate state displayed more than a tinge of defiance of the Centre and its perceived nominees in Gandhinagar.

**A** reasonably predictable pattern is discernible in the political developments over the four decades within these overarching contextual trends and traditions. Starting with the Bardoli agitation (1928) and the Dandi march (1930), the Congress captured the commanding heights of Gujarat politics. While the Bardoli agitation established Vallabhai Patel's reputation as a great party organizer and earned him the title of Sardar, it also marked the beginning of a wonderful infatuation between the Congress and the resourceful Patidar community, especially in the central and north Gujarat regions. This relationship matured into a full-fledged matrimonial affair during the heyday of the Sardar. Jawaharlal Nehru never enjoyed much of a following in the region – a historical fact that came to have a bearing on later developments.

The reorganization of the states in the mid-1950s along linguistic lines left Gujarati sentiment unmollified. The Mahagujarat Parishad unleashed and mobilized powerful sentiments across Saurashtra, Kutch, and the Gujarat regions. Morarji Desai as

the chief minister of the combined Bombay state was seen as betraying the Gujarati cause. By August 1956, the Gujarat region was up in arms against the apparent unwillingness of the Congress leadership – national and regional – to grant a separate state of Gujarat. When Jawaharlal Nehru arrived in Ahmedabad to 'talk sense' to the Gujaratis, the fiery Indulal Yagnik organized a parallel meeting; the prime minister was left fuming and had to address a rather thin congregation.

Soon the Mahagujarat Janata Parishad, a front of various anti Congress, pro-separatist Gujarat forces, was formed in September 1956 to contest the 1957 elections. The second general elections saw the Congress rebuffed in the north and central Gujarat regions; the Congress lost two out of the four Lok Sabha seats from north Gujarat and three out of the seven seats in central Gujarat to the Mahagujarat Parishad. The Congress leadership could not ignore the writing on the wall, and a new state of Gujarat came into existence on 1 May 1960.

**T**he struggle for a separate state of Gujarat had inculcated new political habits which could not be easily shaken off. The Saurashtra region did not exactly vibe with mainland Gujarat, and from the very beginning tension between Jivraj Mehta (the first chief minister) and Balwantrao Mehta was all too palpable. The central leadership was reduced to taking sides, sometime with one faction and sometime with the other. Morarji Desai, always ambitious and mindful of the next battle for national leadership, was understandably keen to have his supporters and his say in the affairs of the new state.

At the same time, when the 'Congress system' arranged a merger of a faction of the socialist leadership

(the Ashok Mehta group) with the Congress, it brought new talent—and a new faction—into the Gujarat Congress; senior political figures of the Praja Socialist Party like Uttambhai Patel, Jaswant Mehta, Ishwarbhai Desai, Narsinh Makwana and Chhabildas Mehta joined the Congress. The socialists, with their characteristic penchant for elaborate factionalism and petty bickering, merrily fanned the factional intrigues and infighting in the Gujarat Pradesh Congress Committee.

**T**he involvement of the central leadership in the affairs of the state was both sought and resented by the state-level factions. Morarji and Nehru, the former quite openly, found themselves on opposing sides in the factional warfare that erupted from the very birth of the new state. The conflict of loyalties was to find its severest expression when the Congress party split at the national level in 1969. The impact of this split was probably more fundamental in Gujarat than in any other part of the country. Inevitably, this factionalism made the Congress unequal to the challenge that was posed by the newly formed Swatantra Party (a loose alliance of the rich farmers, urban industrialists, feudal princes, and a few retired bureaucrats).

Politically, Gujarat too could not remain immune from the gathering anti-Nehru, anti-Congress feeling in the rest of the country, especially in the aftermath of the India-China border debacle. By the end of the 1960s Gujarat was unconsciously slipping into the anti-Centre mood. The massive communal riots in Ahmedabad in 1969 and the failure of government to bring the situation under control, resulting in more than 1,500 deaths, provided the first indications of how political degeneration could take its toll on the efficacy and efficiency of the state administrative structure.

Even after Indira Gandhi established her supremacy in the Congress at the national level, the Gujarat Congress could not overcome the factional bitterness. Indira Gandhi's use of radical rhetoric of social change and economic empowerment of the have-nots merely provided a figleaf of respectability to wanton factionalism. Her much-fabled control and conflict-management skills proved of little use when it came to restoring a modicum of order among her own partymen in Gujarat. The native urge to disregard and defy central control kept alive the factional bush fires. Indira Gandhi's nominee for the post of the chief minister, Ghanshyam Oza, had to eventually make way for the local entrepreneur, Chimanbhai Patel. In turn, the Chimanbhai Patel regime found itself totally grounded when it tried to cope with the Navnirman movement.

**T**his movement itself was a response to Chimanbhai Patel's rough administrative tone and tough political manners. The turning point came when Chimanbhai Patel used his clout on behalf of a crony, Ishwarbhai Patel, to defeat the much respected Umashanker Joshi in the contest for the post of vice chancellor, Gujarat University. No other single incident brought to surface the clash between the political representative of the new prosperous Patidar community and the old 'cultural' establishment which still thought of Gujarat in liberal, enlightened terms. The eruption of student protest and its eventual channeling into a wider political movement trapped Gujarat in an existentialist dilemma.

By the time the movement was finally defanged during the Emergency, a rough edge had entered the Gujarati political soul; the political class, across party lines, found itself

in a sullen, angry and embittered mood. More than the individual resentment, the political community, as well as the business leadership and the educational establishment, had lost its sense of ideological, intellectual and moral anchorage. At one level the Navnirman movement tapped the finest civic impulses; at another, it also saw the beginning of the brutalization of collective morals and manners.

Above all, the Navnirman movement, the experiment in internal emergency, and the flirtation with variations of the Janata Party played havoc with the party system. Organisational loyalty, obedience and discipline took a beating, while personal ambitions and egos acquired a new acceptability. Leaders could change positions, parties and pretensions overnight, without inviting any popular disapproval or parliamentary rebuke.

The next clash came in 1980-81 when the status quoist establishment discovered to its horror that its complacency and divisions had allowed a new political coalition to capture governmental power. The Madhavsinh Solanki-Jinnabhai Darji-Sanat Mehta trio devised and improvised a caste-based coalition of the have-nots—a grand alliance between four numerically dominant communities: Kshatiriyas, Harijans, Adivasis and Muslims (KHAM).

**T**he ensuing rhetoric and politics was organised to engineer a grand divide between the KHAM alliance, and the upper castes of Patels, Banias, Brahmins and Rajputs, all of whom were the erstwhile unchallenged beneficiaries of the existing terms of political exchange. The KHAM yielded rich electoral dividends for the Congress; Madhavsinh Solanki became chief minister (and eventually became the first and the only chief minister to

have completed a full term of five years in office).

The Solanki regime came to power with a promise to change the terms of political exchange to the advantage of the hitherto disadvantaged sections. There was some resistance in the form of the 1981 anti-reservation agitation, but unequivocal support from the Centre, by way of political backing and additional para-military forces, enabled the Solanki government to ride out the storm. Nonetheless, the forces of status quo had served notice, but so preponderant was the Congress legislative majority that the status quoist forces had to bide time till the ruling regime began making mistakes. Meanwhile the Solanki regime did initiate a few pro-poor schemes like the mid-day meal scheme, food-for-all project and so on.

For all its pretensions of ushering in a new social order, the Solanki regime soon turned out to be an essay in tokenism. The regime's real energies and policies were hijacked by the industrial lobby; Solanki wanted to replicate a mini-Japan in Gujarat and he invited the industrialists' cooperation. Entrepreneurs could manage concessions in policy, tax breaks, and land at throw-away prices for the asking.

The balance of sympathy and policies did not tilt dramatically in favour of the have-nots. Nonetheless the KHAM rhetoric ensured that the upper castes were comprehensively alienated from the Congress. The fact that land ceiling laws, even if unimplemented, continued on the statute books angered the rich farmers. Democratic changes in the cooperative laws earned for the Congress annoyance of the entrenched interests.

On the other hand, the habits of factionalism developed during the decades of the 1970s continued to dis-

tract the Congress leadership from administrative coherence and political purposiveness. The one consolation for the Congress was that the opposition forces too had incurred infirmities in terms of organisational discipline and norms, and, therefore, were in no position to mount any effective challenge.

The slide gathered momentum after Solanki led the Congress to an unprecedented second consecutive victory in the 1985 assembly elections. Even before the results were declared a disheartened and disorganised opposition had lit the fires of yet another anti-reservation agitation, this time protesting the reservation granted to the Other Backward Classes (as identified by the Bakshi Commission). When the Congress won 149 seats in an assembly of 182, the forces of status-quo had nothing to lose except their newly created marginalisation. The culture of restraint had vanished.

The anti-reservation sentiment was unabashedly fanned by the Gujarati press, the alienated but resourceful Patel community, the RSS and its front organizations. The agitation soon degenerated into a communal confrontation. Political and electoral preponderance did not help the Solanki regime to best the anti-reservation voices; it became a clash between the numerical majority and an entrenched minority. However, when push came to shove, the Solanki team was found lacking in administrative vigour and political innovativeness to defeat the agitation. After the police revolt and the attack on *Gujarat Samachar*, the Solanki regime had lost its moral authority, if not legitimacy.

Meanwhile, the mantle of central leadership of the Congress had passed onto Rajiv Gandhi, who was fashionably and bluntly unsympa-

thetic to any notion of social engineering. Consequently, when the Solanki regime ran into rough political weather a second time, it received no support or solace from the Centre. Instead, Arun Nehru, the second most powerful man in the Congress, was keen to oust Solanki and to install a pliable chief minister of his choice. Evidently, the gathering impression that the chief minister had lost the confidence of the new, modern, elitist Rajiv Gandhi-Arun Nehru-Arun Singh ruling combine in New Delhi emboldened the anti-reservationist leadership to sustain its agitation.

The new chief minister, Amarsinh Chaudhary, quintessentially answered the Supreme Court's later-day phrase of 'creamy layer'. A tribal by birth, an engineer by training, and a political coward by inclination, Chaudhary based his chief ministerial stewardship on three principles: blind loyalty and servility to the central leadership, a systematic dismantling of the social engineering agenda of the Solanki era and a surreptitious relationship of compromise with the same forces that had opposed the Solanki agenda. Administrative indecisiveness, political vacuity and moral lapses came to characterize the chief minister; Congress factionalism increasingly became rampant and intractable.

Consequently, notwithstanding its brute majority in the state assembly, the Congress government was ill-prepared—mentally, ideologically and administratively—to combat the two major agitations launched by the RSS-BJP-VHP and other Hindu fundamentalists in the second half of the 1980s. Gujarat, in fact, became the first laboratory for the later-day Hindutava experiment. A befuddled and divided Congress watched helplessly as the Hindutava forces began invoking religious figures and tradi-

tions, symbols and festivals for consolidating the Hindu constituency. For the first time in 1986, Ahmedabad witnessed a procession (expectedly through sensitive areas) on Janmashtami. The stand-off between the police and the organizers of the Janaki rath only added to a growing alienation of the Hindu community without helping the Muslims acquire a sense of security.

Throughout 1986 and 1987 and till the middle of 1988, army and paramilitary forces had to be pressed into service as communal riots and violence erupted in towns, big and small, across the state. A thoroughly biased police force proceeded on the assumption that the only way to bring violence to an end was to give the minorities a taste of state repression. The communal divide was complete; the collapse of state authority was total. The Congress' secular credentials stood devalued. In the first electoral contest after the communal violence, the BJP captured the Ahmedabad Municipal Corporation, while Abdul Latif, a prominent bootlegger, won from five municipal wards with a preponderant Muslim electorate.

**P**arallel to this agitation for Hindu consolidation, the BJP leadership launched a farmers' agitation under the aegis of its front organization, the Bharatiya Kisan Sangh, for a regular supply of electricity at subsidized prices. Though the rich farmers dominated the movement's leadership, it captured the imagination of the middle and small farmers as well. The farmers' agitation made the BJP and the Janata Party/Janata Dal groups and its off-shoots realise for themselves the advantages of political cooperation.

The Ayodhya movement and the farmers' agitation totally re-worked the political geography of Gujarat. The

KHAM coalition was broken up and trounced as the two agitations helped the BJP blunt the appeal of caste in favour of the Hindu community. They also brought about a harmonization of the rural-urban divide. The stage was set for a total rejection of the Congress in the 1990 assembly elections. An uneasy Janata Dal-BJP coalition assumed office in Gandhinagar under the redoubtable Chimanbhai Patel, who soon fancied himself as '*Chota Sardar*'.

**B**y November 1990, the coalition broke down as L.K. Advani set out on his *rath yatra* towards Ayodhya as an antidote to V.P. Singh's Mandal initiative. And though Chimanbhai Patel remained delightfully vague whether he was for or against the Mandal package, the BJP simply could not keep his company. Like a jilted lover, Chimanbhai Patel wooed and won the hand of Rajiv Gandhi's Congress; the support extended to the Chimanbhai Patel ministry from the outside was a total and final negation of the KHAM politics of the 1980s.

The BJP now exclusively occupied the entire opposition space. The finest moment of the BJP's political strategy came in the 1991 Lok Sabha election for the Patidar dominated Gandhinagar constituency. The BJP fielded L.K. Advani, while the Chimanbhai Patel-Congress combine put up a Patel candidate. The chief minister personally took charge of the campaign against Advani, raising the slogan of 'P for P' (Patels for Patel); the BJP tasted the heady efficacy of its kisan and communal mobilizations to overcome the appeal of caste. Advani's resounding victory provided the BJP, both in Gujarat and nationally, with its winning formula. Advani and other BJP leaders were convinced of the moral superiority

and political potency of the Ayodhya agitation.

Gujarat was offered a choice between the BJP's promise of wholesome governance based on the principles of Hindutava, and the Congress record of sordidness based on the corrupt script of Chimanbhai Patel. The Congress was now supping with the very devil it had fought in every village and city *pol*. While the totally amoral footwork did help Chimanbhai Patel to survive in office, and eventually to worm his way back into the Congress, the partnership did not in anyway add to his political acumen and administrative capacity to cope with the communal onslaught on the Indian state. In December 1992, Gujarat witnessed greater fury and more deaths than Uttar Pradesh, the epicentre of the Ayodhya movement; the collapse of the state and its moral and administrative authority was total.

**T**he administrative infirmity was only a minor part of the larger suborning of the Indian state from within; the Chimanbhai Patel-H.K. Khan combine was seen as countenancing every single illegal impulse and practice, as long as the price was right. But a weak central leadership was unable to take any corrective steps. In Gujarat the chief minister ensured that all his adversaries and detractors painfully learnt the advantage of the old adage that discretion is a better part of valour. Hence, Rauf Valliullah's cold-blooded murder.

Chimanbhai Patel's revenge on Gujarat came to an end only through divine intervention; he succumbed to a massive heart attack in February 1994. He was succeeded by the entirely colourless and eminently incompetent Chabbildas Mehta, who was totally unequal to the task of taking on the BJP and its unrelenting organiza-

tional and communal mobilization. Under the combined organizational energies of Shankersinh Vaghela and Narendra Modi, the BJP penetrated the tribal areas, co-opted the Harijan leadership, and held on to its traditional support base in urban and semi-urban areas. To no one's surprise it trounced the Congress in the 1995 assembly elections. The resounding success brought in its train its own crop of problems – just as the Congress successes in 1980 and 1985 had produced intense intra-party tensions and conflicts.

Though the BJP's vote in the 1990, 1995 and 1998 elections suggest that Gujarat had become saffron country, the party itself could not remain immune to the Chimanbhai Patel variety of amoral political habits and practices that had become fashionable and respectable in Gujarat's political discourse. The BJP central leadership could not summon the necessary skills of conflict-resolution to arbitrate between the ambitions of Keshubhai Patel and Shankersinh Vaghela. The 1996 split, the eventual installation of Shankersinh Vaghela as chief minister, and the ultimate rejection of Vaghela's Rashtriya Janata Party in the 1998 assembly elections are episodes in the larger saga of gradual but steady erosion in Gujarat's party system.

**W**hat are the emerging parameters of Gujarat politics? First, political exchange is increasingly taking place without the benefit of the old 'genteel' structures and influences that once mediated between the antagonists. This is most vividly evident in Ahmedabad, the epicenter of political turmoil and change. The traditional business families of Ahmedabad, the Lalbhai, Sarabhais and others, no longer wield the economic clout they once did; as the textile industry floun-

dered, the mercantile aristocracy increasingly lost its traditional interest in the quality of civic life. Of late there is a recognition of the need for the business community to take an interest in civic life and there are some feeble signs of involvement. But for most part of the 1980s and the 1990s the political class had to sort out its conflicts entirely on its own.

**S**econd, a decline in the influence of the traditional textile industry is matched by the rise of other entrepreneurs in the petroleum and pharmaceutical sectors. Reliance, Nirma, and the Torrent groups are representative of the new and raw entrepreneurs. Except for protecting its narrow policy and commercial interests, the new industrial class has shown little inclination to intervene in civic and political life. The downstream impact of this new entrepreneurs has not been entirely wholesome. The last time the entire business community joined a collective battle was in 1990 when Chimanbhai Patel goaded the Gujarat Chamber of Commerce to lend its financial and organizational resources to his battle against the Baba Amte-Medha Patkar-led Narmada Bacchao Andolan.

Third, the new capitalistic ethos has gradually eaten into the traditional accent on austerity and non flamboyant lifestyles. The participation of women in vulgar dancing in wedding processions on the street, disco *garba*, a rash-like eruption of country clubs (which are nothing more than respectable gambling dens), the encouragement of drinking as a fashionable mode of socialization and so on, have put a premium on a certain kind of lifestyle which the younger members of the political class finds difficult to resist. The new capitalistic ethos of making money – by hook or by crook – has gained new adherents as rural

society too undergoes comprehensive transformation. The growing numbers of the wealthy rural elite, enjoying the fruits of cash crops like sugar and cotton and a new prosperity has produced the phenomenon of international migration. All this has combined to bring about a uniformity of tastes and biases, of cultural habits and political preferences between rural and urban Gujarat.

Fourth, this economic and cultural churning has contributed to a brutalization of civil society. Gujarati newspapers have added their bit to the coarsening of public discourse in every sphere of civil society. The police and other agencies of the state have succumbed to the temptation of brutalization. The police force itself revolted twice in the 1980s; a sub-inspector assaulted a chief judicial magistrate in Nadiad. The police-criminal nexus is nowhere more evident than in Ahmedabad where bootleggers reportedly have a greater say in the transfer and posting of policemen than the Director General of Police. The elimination by the police of criminals like Raju Risaldar in 1992 or Abdul Latif in 1997 in fake encounters are two prime examples of this brutalization of collective political manners and biases.

**F**ifth, there is a marked decline in the quality of leadership as buccaneers have pushed out the older set of leaders. The state once boasted of tall leaders like U.N. Dhebar, Jivraj Mehta, Balwantrao Mehta; of leaders like Hitendra Deasi, Ratubhai Adani, Jeenabhai Darji, Madhavsingh Solanki, and Sanat Mehta. Today, all that the BJP has on offer is a second-rate *moffusil* leader like Keshubhai Patel. The decline in integrity and competence apart, the new breed of leaders lack moral authority and stature, a deficiency which makes the task of

governance much more complicated. The other agencies and institutions – the judiciary, bureaucracy, cooperatives, NGOs, trade unions, business community – simply cannot be expected to display the requisite degree of trust and respect when dealing with the political leadership.

Finally, there is a virtual collapse of the party system. The BJP is desperately trying to enforce centrally-dictated discipline and hierarchy. Chimanbhai Patel completely devalued the party organization and instead relied on the Patidar community for mobilization and support. Shankersinh Vaghela has been dealt with, but the Vaghela virus is now rampant in the body politic. The Congress is reconciled to an unhappy balance between the 'high command' and local initiative; for example, the Ahmedabad-based political leadership succeeded in defeating the central preference for an electoral understanding with Shankersinh Vaghela's Rashtriya Janata Party. This collapse of the party system will continue to play havoc with discipline and loyalties and will produce periodic turmoil in the state's body politic.

**G**ujarat appears to have tilted towards a two party system, though there still is a sizeable chunk of political opinion and loyalty available for mobilization beyond the BJP and the Congress. Since the Congress won 55.5% of the popular vote in 1985, no political party has re-established its majority among the electorate. In 1995, the BJP share was 42.5% which increased only marginally to 44.3% in 1998. The Congress share has remained reasonably stable: in 1990 it came down to 30.5%, increased to 32.8 in 1995, and to 35% in 1998. However, the third force cannot be wished away. In 1985 the Janata Party got 19% of the vote; in 1990 the Janata

Dal got 29.3%. But in 1995 when the Janata Dal and the Congress merged, the 'independents' cornered as much as 18.7% of the vote-share. Similarly in 1998, the third force, the Rashtriya Janata Party of Shankersinh Vaghela, garnered 11.5% of the vote.

**T**he struggle for Gujarat's political soul continues. The choice before the state is to find an optimum mix of its national heritage, the globalising instincts of its international connections (the overseas Gujaratis), and its regional pride. Though Vaghela's Rashtriya Janata Party has been shown its place, it is too early to argue whether the Vaghela sentiment has been adequately dealt with. Recently, this sentiment was articulated as a clash between the glory of Gujarat and the distant, removed leadership based in New Delhi. A BJP document notes: 'He (Vaghela) believed that any person blemishing the glory of Gujarat and behaving immorally towards women should be debarred from the party. If his party (the BJP), instead of punishing the guilty, punished him and expelled him he would not sit idle and suffer humiliation. He roared like a lion, like the great Indulal Yagnik of yesteryears. His challenge broke up the BJP.'

The BJP's answer to this appeal was to crank up an imagery of *Bharat Mata*. With its considerable gift for innovativeness, the BJP has used every traditional avenue to equate Hindutava with Bharat Mata; for example, it recently experimented with the Ganesh Chaturthi celebrations. Predictably, however, this push for an overarching national perspective has often degenerated into ugly communal manifestations. If Gujarat can discover the creativity and enlightenment to blunt such communal appeals and tactics, it may then initiate a new trend in the national polity.

# Economic prospects

PRAVIN VISARIA and  
SUDERSHAN IYENGAR

GUJARAT is a highly urbanized state, second only to Maharashtra, from which it was separated on 1 May 1960. Both Gujarat and Maharashtra were, during 1956-1960, part of the former bilingual Bombay state (which was created to demonstrate the possible benefits of large multi-lingual states). During the British rule in India, large parts of both the states constituted the former Bombay Presidency. Relative to Maharashtra, Gujarat is small in terms of both area and population. With an extensive common border, Gujarat and Maharashtra have strong links with each other and both are grouped among the more progressive and relatively developed states of India. There is often a subtle competition between the two and they tend to emulate each other's policy initiatives.

Gujarat accounts for only about 5% of India's population and for about

6% of the geographical area of the country. The average density of population in the state (215 per sq km) is a little lower than the national average at 230. This is so because it includes the second largest district of the country, Kutch with an area of 45,652 sq km, which is largely uncultivable and covers the famous large *Rann* or desert in the north and the little Rann in the east. Kutch forms 23% of the total area of Gujarat and has only 3% of the state's population. Its exclusion would raise the density by 26% to 266 per sq km.

An assessment of the economic progress of Gujarat has to begin by recalling some elements of its history. First, Surat, a historical town of south Gujarat located near the mouth of Tapi river, was for long the seat of the English factory and the administrative headquarters of the East India Company during the 17th century. The

silting of Tapi led to the decline of the town and the Company's headquarters shifted to Bombay. However, the people of Surat and its environs developed and maintained close links with Bombay, which became and continued to be for almost a century the headquarters of the presidency named after it.

The railways in India developed during the 1850s and the first train originated in Bombay. The ensuing decades connected Gujarat as well and made it a part of the hinterland of Bombay. (The current Western Railway used to be called the Bombay, Baroda and Central India Railway or the BB&CI.) The trading community in Bombay was drawn largely from Gujarat and a large number of migrants engaged in white collar or services sector in Bombay came from Gujarat. These historical links between Gujarat and Bombay have been too strong to be severed by the formation of a separate state of Gujarat.

**S**econd, large parts of Gujarat were for long ruled by the erstwhile native states or princes. Saurashtra (or Kathiawar) included in its area of a little over 57,000 sq km, 14 salute states, 17 non-salute states and 191 other small states exercising varying degrees of jurisdiction. (The scatter or dispersal of territorial rights led to the division of the area of Kathiawar into about 860 different jurisdictions.) Elsewhere, there were 17 full jurisdictional states and 127 semi jurisdictional and non-jurisdictional units (which had a total of 271 shareholders). These states included some ruled by progressive princes such as Baroda, which along with the other 'Gujarat states' were merged with Bombay province.

The small area of Dangs was parcelled among 14 chiefs (13 Bhils and one Kokani) and was made a separate district of Bombay province; the

same arrangement was made for four states of Rajputana agency (Palanpur, Danta, Idar and Vijaynagar). As a part of the integration of these states with the Indian union, the Kathiawar states were merged into a united state to form Saurashtra, and the border state of Kutch (or Kachchh) was made a separate Chief Commissioner's Province. These arrangements continued until 1 November 1956, when the bilingual Bombay state was created and included all these parts of what today constitutes Gujarat. (For details see, V.P. Menon, *The Story of the Integration of the Indian States*. Bombay, Orient Longman, 1961.)

**T**he feudal past of large parts of Gujarat had created a status-conscious, caste-ridden, hierarchical society, in which most rulers and their followers constituted a largely parasitic class. A democratic polity has, therefore, been rather difficult to establish in some parts of the state. The legacy of the past continues to haunt the present generations and contributes to problems of establishing and maintaining the rule of law. While these problems are not openly discussed, such discussion is vital for evolving a more integrated society, with a consensus about its goals and the adjustments to be made to promote equity along with a merit-based efficient system that also recognizes the inexorable market forces.

Third, while the long coast line of about 1500 km facilitated extensive contacts between Gujarat and Persia, East Africa and the rest of the world, the niggardliness of mother nature with respect to the natural resource endowments of the region stimulated a search for greener pastures. It is unclear whether and how far the feudal social setting encouraged the rebellious and the innovative to move out and try their luck elsewhere. However, over large parts of Gujarat,

rainfall tends to be scanty and erratic. Average rainfall in Gujarat is about 833 mm, with only 3 of the 19 districts having a rainfall of 1000 mm or more. Large parts of Saurashtra (except parts of Junagadh) and Kutch are known to be arid or semi-arid regions, with frequent droughts.

Over the 25 years between 1970-71 and 1995-96, in 12 years the output of Gujarat's primary sector declined over the previous year because of inadequate rainfall. In such years, not only are the human needs for foodgrains met through imports from other states, but grass has to be transported over long routes from the rest of Gujarat and neighbouring states. Even more critical is the need to transport drinking water for human and animal consumption through tankers. The seasonal migration of Maldharis and their families from the northern dry districts to south Gujarat is a common sight along the highways of Saurashtra and central Gujarat.

**A** logical consequence of periodic droughts and seasonal migration is the acceptance of mobility of labour as a means of survival and economic progress. It has broadened the horizons of the people of Gujarat and the traditional resistance to crossing the seas in search of higher incomes was overcome a long time back. The resulting exposure to the lifestyle of the developed and western world has influenced the preferences about housing; the demonstration effect has also led to efforts to improve the infrastructure of educational and health care institutions in the towns and even the villages of Gujarat. The remittances from abroad and other parts of the country have made Saurashtra and Kutch 'money order' economies, in which the surpluses have been invested not only in agriculture (particularly irrigation and pumpsets or

tractors and trailers) but also in small scale industries.

Over the 25 year period since 1970-71, the state domestic product (at 1980-81 prices) has grown at an average annual rate of nearly 5%. With population growing at the rate of 2.1% over this period, the per capita state income has risen at the rate of about 2.9% and has registered a growth of about 106%. This is not a bad record in view of the fluctuations in the fortunes of Gujarat's agriculture. As a result, Gujarat has come to occupy the fourth rank (after Punjab, Maharashtra and Haryana) among the more populous states with respect to per capita state domestic product.

**D**espite the poor performance of agriculture in Gujarat, the income growth has been above average because of the state's drive for industrialization. The number of working factories has risen from 5,544 at the end of 1970 to 16,810 at the end of 1994; the average daily employment in these factories has almost doubled from 4.4 lakh to 8.1 lakh. The number of registered small-scale industrial units (SSIs) in the state has increased 10-fold from 15,879 at the end of 1970 to 178,627 at the end of 1995.

In fact, the growth of both large and small and medium industries has made Gujarat the second most industrialized state in the country after Maharashtra in terms of the per capita gross industrial output or value added in industries. The decline of the cotton textile industry has meant a sharp fall in the production of cotton cloth from the peak of 1388 million metres in 1980 to only 266 million metres in 1993. However, the state has seen a rapid development of the chemical and other industries. It accounts for a significant share of the national production of salt, caustic soda, fertilizers, sulphuric acid, as well as petrochemicals.

Growth of industrial production has been facilitated by a 15-fold increase in the installed capacity for the generation of electricity from 333 MW in 1960-61 to almost 5,000 MW during 1992-93. Actual generation of electricity has increased almost 18 fold from 1.3 billion KWH to 23.0 billion KWH over the 32-year period. The number of electrified villages has increased from only 823 at the end of 1960-61 to 17,985 at the end of 1991-92; electrification was considered 'not feasible' in the remaining 129 villages.

This has been achieved despite the limited scope for generating hydro power. There are few perennial rivers in Gujarat. The construction of a large dam on the Narmada and the harnessing of its potential for hydro power have been bogged down in controversy for an inordinately long period. Coal has to be transported over long distances at a high cost; and as a result, thermal power is the main and an expensive source of electricity for the region.

**T**he discovery of oil around Ankleshwar in Bharuch and Kalol in Mahesana, as well as the offshore oil and natural gas reserves in Bombay High has mitigated this general paucity of minerals in the region; and some entirely gas-based power plants have been commissioned or are being planned. With known reserves of 158 million tonnes of petroleum (almost 20% of the national figure), Gujarat contributed about 6.3 million tonnes (19.5% of the national total) to the country's crude oil production during 1994-95. Also, against estimated reserves of 93 billion cubic metres of natural gas, it produced about two billion cubic metres of natural gas during 1994-95 (about 14% of the national production). On the whole, however, the scarcity of resources

has been a major factor in influencing the nature of development in Gujarat.

**A**lso, except for oil and gas (both on-shore and offshore), lignite in Kutch, limestone in Saurashtra, and bauxite, Gujarat has rather limited mineral wealth. Of course, Japan has demonstrated that the local resource base is not a decisive determinant of the level of development of a region. Resources can be imported and with international trade acting as an engine of growth, the process of value addition can lead to the development of a country or a region. The paucity of natural resources also tends to influence the make-up of the human factor and somehow often endows the latter with an innate capacity to overcome the challenges of a constrained environment.

While the social psychological underpinnings of this hypothesis need to be supported by well-focused interdisciplinary research, casual empiricism suggests that both the Marwaris of Rajasthan and several groups of Gujaratis from Saurashtra and Kutch have responded in an exemplary manner to an inclement nature with a remarkably high level of entrepreneurship. They have minimized the effects of imbalance between human and natural resources through out-migration to regions with better resource endowments (both within and outside the borders of India) to raise their own level of income and to plough back a part of their savings into the development of their motherland. Several developments of the post-independence period seem to suggest and support this observation.

The advocates of 'bilingual Bombay' had in 1956 argued that the separation of Gujarat and Maharashtra would lead to an exodus of Gujarati capital from the latter and slow down

its development. The fear has not been confirmed by actual events. The Gujarati entrepreneur, to a large extent, has not found it either necessary or advisable to move to Gujarat. Over the years, many Gujarati entrepreneurs have indeed set up their factories in and around places like Vapi and Umargam near the border with Maharashtra. However, most of them prefer the cosmopolitan life of Mumbai, with the anonymity of a megalopolis, to living in Gujarat.

**A**n important factor contributing to this process has been the impression of a decline in the standards of education in Gujarat since adopting Gujarati as the medium of instruction in schools and universities. This decision was taken on the presumption (highlighted in Gandhian literature, without adequate empirical support) that education through mother-tongue would help develop the creative faculties of young children. However, Gujarati entrepreneurs, seeking to establish links with the rest of the world through migration and/or periodic training or visits, find the medium of regional language an unnecessary constraint and have educated their children in English-medium schools and colleges both in and outside Gujarat. A former chief minister of the state was reportedly told by industrialists, whom he was trying to woo to set up industry in Gujarat, that their staff did not like to move to the state because of their perception of a relatively low quality of educational and health infrastructure even in metropolitan cities (with more than a million population).

The results of this unwillingness of Gujarati capital to move out of Maharashtra on a significant scale are evident in the composition of investments made in the state over the past few decades. A detailed study of the subject is yet to be made and it is a

moot point whether Parsis should be classified as non-Gujaratis. However, non-Gujarati capital has indeed moved to Gujarat; and the groups operating in different parts of the country (the Tatas, Birlas, Ruias, the Raunaq Singh group, the Dalmias, as well as multinational groups such as ABB) have set up industries in the state. Among the 30 companies with total estimated sales of Rs 200 crore or more during 1995-96, three were central government concerns (Indian Oil, ONGC and IPCL); three were joint sector companies set up partly with share capital invested by the Government of Gujarat (GSFC, GNFC and GACL); and two were cooperatives producing fertilizers with capital invested by the farmers themselves (IFFCO and KRIBHCO). Among the 22 private sector firms, the well-known Gujarati industrial groups such as the Lalbhai, Sarabhais and Mafatlals have been joined by new companies such as Nirma (Karsanbhai Patel), United Phosphorous (Raju Shroff), Pidilite (Parekhs), and Gujarat Ambuja Cement (Nevatia).

**I**n addition, the Gujarati leadership was called upon to help build the financial infrastructure for industrial growth throughout the country. It included the Industrial Credit and Investment Corporation of India (chaired by G.L. Mehta, H.T. Parekh and Siddharth Mehta for many years) to assist the private sector industries as well as the Unit Trust of India (headed by R.S. Bhatt and Surendra Dave), which mobilized funds for investment in the capital market. Besides, Dhirubhai Ambani, more than anyone else, successfully demonstrated the feasibility of mobilizing a large volume of funds from individual investors for growth industries such as Reliance.

As of February 1997, about Rs 71,196 crore of investment in

manufacturing activities was on hand in Gujarat, over two-thirds of it in the chemicals industry. The figure was higher than for 16 other major states with a population of five million or more; it formed almost 16% of the national figure for manufacturing investment. This investment includes a major petroleum refinery being set up by the Reliance group in Jamnagar and other chemical units of the same group as well as the Essar (Ruia) group around Hazira in Surat district. These are capital intensive industries and except during the construction phase their impact on employment may not be significant. However, the additional demand for consumer goods and services created by income growth and the growth of ancillary industries would indeed augment employment.

**I**nterest on hand for infrastructure (such as power or energy, transport, irrigation, finance, communications, education and health) was, however, higher in Maharashtra, Karnataka, Andhra Pradesh and Madhya Pradesh. As a result, Gujarat's share in the all-India investments on hand came to 10.4% of the national figure of Rs 1171,549 crore and it ranked third after Maharashtra and Karnataka. This situation partly reflects the fact that compared with Maharashtra and Karnataka, Gujarat already had a better relative level of infrastructure development in 1993-94 than the country as a whole. However, compared to Punjab, Kerala, Tamil Nadu and Haryana, Gujarat still has a long way to go towards improving its infrastructure. (For details, see, *Profiles of States*, Centre for Monitoring Indian Economy, Mumbai, March 1997.)

Of course, the term 'investments on hand' is somewhat tentative. While for 60% of it, the projects were already being implemented, 27% was in the

'proposed' category and 13% had only been 'announced'. Some of the plans and proposals could undergo change in the light of subsequent developments, including political uncertainty or the recession affecting Indian industry over the past several months. Yet, it is important to note that, until recently, Gujarat had sent a part of its savings out to other parts of the country by way of subscriptions to the primary issues of equity and debt. In March 1996, its credit-deposit ratio for scheduled commercial banks was 53%. While some analysts criticize this situation as reflecting a diversion of the state's resources to other areas, it probably reflects the relatively lower demand or need for bank credit in Gujarat than in other states; and should lead to higher returns for the investors in Gujarat.

**T**he industrialization in Gujarat is a natural response to the relatively limited scope for agricultural growth. Over the past 50 years, successive governments have tried hard to raise the area under irrigation by constructing dams wherever possible. The percentage of gross cropped area under irrigation has risen from about 10 to 29 by 1993-94, but remains below the national average of 35%. Also, about 78% of the net irrigated area in Gujarat receives water from wells, whereas the corresponding national figure is only 53%.

The cropping intensity index or multiple cropping during 1993-94 in Gujarat was 114, compared to the national average of 131. Tractorisation has proceeded to give Gujarat the fourth rank (after Punjab, Haryana and Uttar Pradesh) with respect to the number of tractors per 1000 hectares. The number of pumpsets in use has also grown rapidly although Gujarat occupies the eighth rank among major states. Overall, as a result of the vari-

ous developments, power consumption in agriculture in Gujarat during 1993-94 was 812 KWH per 1000 hectares, next only to Punjab's 832 and more than twice the national average of 379.

**A** major change in Gujarat's agriculture has been the shift to commercial crops such as groundnut, cotton and tobacco, which accounted for almost 42% of the area under principal crops during the triennium ending 1994-95; the national figure was only 12%. This shift is consistent with the general spread of monetization and the ascendancy of a culture of economic valuation of alternatives in Gujarat. However, it has led to over-exploitation of the underground water resources of the state. This has resulted in a sharp decline in the water table not only around the metropolitan cities such as Ahmedabad but also the districts of Mahesana and Banaskantha in north Gujarat and in Saurashtra and Kutch.

Areas near the coast also face acute problems of ingress of sea water, which will have adverse implications for both agriculture and for meeting the human needs of drinking water. The draft on water resources far exceeds the rates of natural recharge and the state is likely to face an acute water shortage, which is a vital resource for not only agriculture and industry but also for the very survival of human beings. The state needs to promote extensive use of all water-saving devices such as drip irrigation, recycling of water and de-salinisation. Despite some welcome indications of watershed planning to construct bunds and other means of harvesting rain water, there is insufficient recognition of the gravity of the problem.

The most important challenges facing Gujarat are likely to lie in the development and management of

human resources. First, Gujarat has a much higher proportion of scheduled tribes (15%) than the country as a whole (8%). Most of them are located in districts and talukas on the border of Gujarat with neighbouring states. While many of them have over the years moved markedly towards joining the mainstream of development and have not remained isolated from the more developed districts, special efforts need to be made to improve their access to avenues of social advancement such as schooling and education, particularly for their girls and women. The problem is not limited to the supply of facilities. Every village and every habitation or hamlet within a village, has a primary school within walking distance. However, a demand for schooling remains to be created and the young as well as their parents need to be convinced about the advantages of attending school. Second, the quality of schooling and education in Gujarat needs to be improved to match the has of a state with an ambition of being a centre of industry.

**T**he traditional links of Gujarat with Bombay and the rest of the country have weakened insofar as the number of Gujarati students migrating to Bombay for education has declined. More students probably go abroad in search of higher education and the return rates among them remain to be studied. However, if Gujarat is to emulate Japan as a state that compensated for local resource scarcity through trade, it must build a strong knowledge industry. The efforts in this respect seem to be weak. Not only are the literacy rates and student population ratios in Gujarat (reported in the Factfile) lower than those in Maharashtra and Tamil Nadu (though higher than in the country as a whole), but the quality of educational attainment leaves much to be desired.

Some other areas of concern merit attention. There was a time when non-Gujaratis faced no problem in moving to Gujarat. This climate of open hospitality helped industrial development. Today, there are ominous symptoms of intolerance that are likely to prove counter-productive for a state that sends out a substantial number of migrants. These symptoms are reflected in numerous recent incidents, which may have a much larger impact than appreciated by those involved.

Economists talk of a widely observed Gresham's law, according to which 'bad money drives out good'. Once the confidence and reputation of a group or a state is destroyed, it is difficult to rebuild it. Therefore, compromises on such issues could be dangerous. A group that seeks free or easy entry into other states or markets cannot deny to the others access to its own territories without serious consequences, even though out-migrants or emigrants are not noticed whereas in-migrants are indeed seen. Gujarat is bound to gain from free movement of labour and capital and must not do anything that would jeopardize continued free movement of the factors of production.

**A**mong other developments, the rate of population growth in Gujarat, which exceeded the national rate, has declined significantly during the 1980s. Fertility (the average number of children born to a woman over her child-bearing period) has dropped from more than 6 to between 3 and 3.5. The effect of this remarkable change on the rate of population growth is not yet visible because of the simultaneous drop in the death rate. Infant mortality has dropped from more than 225 deaths per 1000 live births to about 60-65 during 1995-96; and the average lifespan probably exceeds 60

years. This figure is much lower than the 72 years estimated for Kerala and there is no reason why Gujarat cannot improve its performance in this respect by promoting some relatively simple measures to provide basic health care to its population.

**A**ccording to the current official projections of population, Gujarat will achieve replacement level of fertility during 2011-16. Total population is expected to grow to 49 million in 2001, 56 million in 2011 and 59 million in 2016. Our own long-term projections envisage a somewhat smaller population of 58 million by 2021 which is expected to stabilize at about 68 million in 2076 and after. Only time will tell whether we are being over-optimistic about the feasible pace of social engineering in Gujarat. However, given enlightened leadership, a state that produced not only the apostle of peace and non-violence but also the iron man of India who integrated more than 562 native states into the Indian union, can certainly muster the necessary strength to achieve the welfare and development of a people endowed with an intrinsic strength to withstand the paucity of natural resources.

A factor that should help this process is urbanization. The considerable growth of transport and communication facilities throughout the state is a welcome development, and many of the large villages can be reclassified as towns. During the 1951 Census, Saurashtra was the most urbanized state of India, partly because the seat of each princely state was classified as a town and often shared some urban characteristics. The 1961 Census declassified 74 towns of Gujarat and treated them as rural, while it also added 14 new towns to the list. As a result, urbanization appeared to have slowed down between 1951-61 though it remained above the all-India level.

Since 1961, the number of towns in Gujarat has increased from 181 to 264. Nearly two-thirds of the urban population in 1991 lived in 'cities' with a population of 100,000 or more and only 10% in small towns with a population of less than 20,000. However, as in the country as a whole, about 70% of the growth of urban population in Gujarat during 1981-91 was a result of natural increase of the population already resident in urban areas in 1981 and net rural-urban migration accounted for only 20% of the growth. (The balance 10% was a result of reclassification of areas from rural to urban.) As one looks ahead, by about 2021 nearly 50% of the total population of Gujarat will indeed be resident in towns and cities (whose number is expected to rise partly through reclassification).

**I**t is therefore imperative that Gujarat should initiate urgent steps to improve the living environment in the urban centres, even as it tries to better the rural living conditions. The living conditions in several cities are appalling and just as Surat has reportedly been cleaned up, a well-coordinated programme needs to be initiated in other cities, towns and villages. Gujarat has the non-governmental organizations as well as the tradition of initiative and local-self government that should help to realize these goals.

As the fortunately short-lived plague epidemic in Surat city during 1994 demonstrated, the cost of neglecting urban infrastructure are high and can bring the entire country to the brink of isolation from the rest of the world and interrupt all trade and commerce. Issues of sanitation, health and hygiene in towns and villages cannot be ignored, except at high risk. As the father of our nation had repeatedly suggested, a clean environment forms

the very foundation of development and must receive the highest priority in our planning efforts. Over the past 50 years we have ignored the sound advice of Gandhiji and need to make it the starting point of our developmental activities.

Another dimension that is closely linked with the process of development in Gujarat is the growing unwillingness of the youth, not only from urban centres but also of those from rural areas, to work in agriculture. This feeling is widespread both in the relatively prosperous Kheda district and in Saurashtra. The growth of the footloose industry of diamond polishing has facilitated the spread of these preferences. However, other similar activities with a high level of value addition and a good market need to be identified and developed. The ready-made garment industry as also other activities requiring assembling of parts and components such as for electronic equipment can easily be developed in Gujarat.

However, the past efforts to set up special industrial estates in the state capital have not achieved the expected degree of success. The foundations of such development can be laid only through universal literacy, vocational education to promote craftsmanship and technical skills, and a sound knowledge base. Urgent attention needs to be paid to the issues of arresting environmental degradation (of air, water and soil) and protecting the natural resource base, including the forest wealth of Gujarat. The ecology commission set up by the state, as also the concerned intelligentsia need to play an active role in safeguarding the interests of the future generations and restraining the maximization of short-term gains by the present population. A far-sighted leadership must evolve a balanced long-term perspective so that this dynamic state can develop to its best potential.

# Polarised communities

GHANSHYAM SHAH

IN the 1980s, Gujarat was plunged into two widespread anti-reservation agitations spearheaded by the upper castes. The first (1981) was directed against the Scheduled Castes (SCs) and Scheduled Tribes (STs); the second (1985) was against the Other Backward Castes (OBCs). The deprived groups failed to unite in their fight against the upper castes with the result that the government diluted its pro-OBC and dalit policies. During the second agitation, which took the toll of Chief Minister Madhavsingh Solanki, inter-caste conflicts occasionally turned into communal riots between the Hindus and Muslims, sidetracking the issue of reservation.

In the subsequent years, communal riots continued to dominate public life in Gujarat. Between 1988 and 1993, the state experienced the highest number of anti-Muslim riots in the country. Cashing in on these communal clashes, the BJP ultimately rode to power in 1995. With the BJP at the helm today, pro-backward caste politics has decisively taken a back-seat.

The inter-caste and Hindu Muslim conflicts convey an impression that Gujarat is sharply polarised on caste as well as communal lines. To an extent this is true, but the intensity of both has not been the same. Despite an ascendancy of caste identity and

consciousness at the ground level, communal polarisation between Hindus and Muslims has been sharper than that among the castes. The state does not have a Mayavati, Mulayam Singh or a Laloo Prasad Yadav who deploy a caste idiom and argue against communal politics. On the other hand there are many, including from among the OBCs, who talk the language of communal politics *a la* an Ashok Singhal, Thakare or an Uma Bharati. The agenda of the champions of Hindutva is to integrate various castes in harmonious unity against the 'others'.

**A** hundred years ago, according to the *Bombay Gazetteer*, Gujarat was 'pre-eminently a land of castes. In no part of India are the subdivisions so minute...' In 1827, there were as many as 207 castes in the city of Surat alone which did not marry outside of their community.<sup>1</sup> Over time, new castes formed and several acquired a new nomenclature. Given the different historical experiences and uneven development over the last century, social and economic inter-relationships between different castes vary throughout the region. Hence, the need to be cautious about any generalisations at the macro level.

Gujarat is a land whose people are blessed with great business acumen. Vantias, one of the forward castes, constitute nearly 3% of the population. They are scattered throughout the state with a majority now living in urban areas. They occupy leading positions in business and industry. Pragmatism is the dominant cultural trait that influences their behaviour and inter-personal relationships. Their primary concern is to protect

their business interests rather than hold political office. Though they initially resisted the rise of new progressive groups, their adjustment to the changing circumstances was quick. The pragmatism of the Vania has become synonymous with Gujarati culture.

Brahmins and Rajputs are the other important forward castes. Brahmins, comprising 4% of the population, form the single largest group in white-collar jobs and new self-employed professions like doctors, engineers and architects. Few Brahmins and Vantias live a hand to mouth existence, or work as manual labourers in the farm and non-farm sectors. They, however, enjoy leadership positions in the trade unions of both the organised and unorganised sectors. Brahmins continue to hegemonise educational institutions, literature, media and other spheres of public life and have assumed responsibility as the torch bearers in society by articulating, producing and reproducing cultural values, idioms and goals.

**R**ajputs, traditionally rulers and army men, constitute another 5% of the population. Though occupying a high status in the caste hierarchy, their position in the forward caste bloc is ambivalent. Their cultural practices and economic conditions are different from those of the Vantias. A majority of them are not well-off. Nearly a fifth are landless labourers. Their educational level is relatively low, similar to that of the backward castes. Moreover, they have marital ties with the Kolis and other tribes considered low in the Hindu caste hierarchy.

The Patidars, traditionally known as Kanbis, have improved their economic condition over this century. They constitute the largest peasant caste and a majority of them are either middle class or rich peasants. In urban

areas, a sizeable number are in business – small and big – professionals, and hold white collar jobs in the private and public sectors. They constitute the single largest social group among the Gujarati NRIs in North America and Europe.

**T**he Patidars follow many of the cultural practices of the Vantias and consequently elevated their position from the middle to high caste. Of course, this was not without resistance as it challenged the hegemony of the Vantias and Brahmins. The latter could not block the Patidars given their economic clout and numerical strength which at 13% of the population, is more than the Vantias and Brahmins put together. However, the Patidars are less pragmatic and more aggressive than the Vantias in asserting their position. While they have steadfastly protected their newly acquired power and position and now enjoy a leading position among the forward castes, their relationships with other castes remains conflictual.

Together, the forward castes constitute roughly 26% of the population. They occupy three-fourths of the middle class space and more than 95% of the rich class space, owning big industry and business firms in the state. With a few exceptions, mostly Rajputs, who are for all practical purposes closer to backward castes, they stand apart.

The government of Gujarat has identified 82 castes as socially and educationally backward. Also known as the other backward castes they constitute nearly 40% of the population. Among them, 65% of the castes belong to different segments of the Kolis, constituting around 24% of the population. A large number are poor peasants and agricultural labourers. In urban areas they are blue collar workers in the formal and informal sectors.

1. James Campbell (ed.), *Gazetteer of the Bombay Presidency*, Vol IX, Part I, *Gujarat Population: Hindus*, Government Central Press, Bombay, 1901.

As many as 35% of the Koli families, as against 8% of Vaniyas and Brahmins, are totally illiterate. However, differentiation within the Kolis cannot be overlooked.

**O**ne-tenth of Kolis are rich peasants. A small number are in self-employed professions and business, competing with the forward castes. The Thakores, Patanvadias, Bareeyas and others of central Gujarat, whom the British census officers clubbed with the Kolis, do not accept this identification. They prefer to call themselves Kshatriyas. Whereas the Kolis of Saurashtra are known by the same name, those of south Gujarat are recognised as Koli-Patel. The Kolis of south Gujarat are more educated and enjoy better prospects in non-farm economic activities than their counterparts in central Gujarat.

Scheduled Castes, traditionally called untouchables (now dalits) form nearly 7% of the population. Most of them are small and marginal farmers, agricultural labourers and non-farm workers in rural areas, or blue collar workers in urban areas. But at least 6% of the families have at least one member who has been to college. This proportion, though still low in comparison to Brahmins and Vaniyas, is higher than among OBCs or even Rajputs. In primary and secondary

education they compete with Patidars. Their proportion in government jobs, due to reservations and their collective assertion, has considerably increased during the last two decades despite opposition of the forward as well as other backward castes.

Scheduled tribes comprise 15% of the population. A vast majority of them are marginal farmers and agricultural labourers. Of the social groups whose land has been acquired by the government for various 'development' projects such as dams and industries, they are the biggest sufferers. Their forest resources are being depleted and they constitute the main losers in a fast developing market economy. The incidence of higher education among the STs remains low and its proportion in white collar jobs, despite reservations, is insignificant.

**O**n the whole, it is the forward castes who have cornered the benefits of development in agriculture and industry. But this does not mean that the deprived castes have not gained since Independence. Though the overall gap in socio-economic conditions between the forward and deprived castes has widened, at the same time a small strata of the OBCs, SCs and STs with productive assets, marketable surplus and skills have managed to become part of the urban middle class.

Having somewhat improved their economic position, they aspire to a higher social status. One route to upward mobility is sanskritisation through joining reformist religious sects. They perform religious rituals and ceremonies and imbibe the value systems of the forward castes. They are advised to maintain the *varna* system and preserve their *dharma* to claim higher social status. In order to maintain their newly claimed identity, they distance themselves from and look down upon those who are traditionally ranked below them. Thus is caste hierarchy legitimised and perpetuated.

**T**he modern service sector is the only non-traditional vocation available to a small segment of the deprived castes to secure income, status and power. The rich peasants among the OBCs are not wealthy enough to absorb the entire family in agriculture, nor have they accumulated sufficient surplus to invest in business and industry. It is mainly reservation in government jobs (7% to 14% for SCs and STs respectively since 1951 and 10% for the OBCs since 1976) which has facilitated their entry in this sector.

Not that this has been without resistance from the forward castes who consider it their traditional prerogative to be white collar employees.

TABLE 1

Land Ownership by Caste of Households in Rural Gujarat \*

	Brahmin	Vania	Rajput	Other upper castes	Patidar	Artisan castes	Koli	Other backward castes	SC	ST	Muslim	Others	N

\* Data collected in 1984-85.

They claim that they are more efficient than the members of deprived castes. Rising unemployment among the educated has added fuel to the fire. The bureaucracy, dominated as it is by the forward castes, has resorted to various tricks to sabotage the reservation policy. It evidently irks the forward castes to see a new generation of OBCs and dalits assert their rights to lead a dignified existence.

**V**arious legislations abolishing the zamindari system in the fifties sharply polarised the Patidars and Rajputs, particularly in Saurashtra. The former gained while the latter lost their privileges and political power which they had enjoyed for centuries. The Rajputs have not been able to overcome the hangover of past glory and power. They consider it infra dig to take to the plough and where they have, agricultural output has hardly improved over the last five decades.

The Patidars on the other hand, having occupied a leading position in the freedom struggle, dominated the Congress party and government. They have benefited most from the subsidy, credit and other inputs under various community development programmes. They successfully made the shift to commercial crops like groundnut, sugar and cotton. With surplus from agriculture and through entrepreneurship some of them have entered business and industry. The Rajputs are envious of their prosperity. This has resulted in a conflict between Rajputs and Patidars in Saurashtra which is all-pervasive in educational institutions, the co-operative sector and in village politics, often leading to violent clashes.

In mainland Gujarat, the primary conflict is between the Patidars and the Kolis. The Rajputs of this region, who were not big landlords, side with the Kolis given their tradi-

tional rivalry with Patidars. In the 18th and 19th century the Kolis, who once owned land, were reduced to becoming tenants and agricultural labourers by the Patidars. The land reform legislation could not restore their ownership rights since the Patidars successfully managed to retain the land and evict the Koli tenants. With the commercialisation of agriculture the Patidar-Koli conflict further sharpened as the latter usurped common property resources. Clashes between the two in this part of the state centers around land and wages.

**U**pto the early fifties, it was the forward castes who fought over political power. The competition between Patidars on the one hand and Vaniyas and Brahmins on the other generated tensions within the Congress party. The latter, though not aggressive, were crafty enough to maintain their position and protect their interests. The Rajputs, however, openly confronted the Patidars. They realised that

in order to protect their interests and wrest political power, they needed to expand their support base. This they did by incorporating the Kolis in their fold as Kshatriyas. The Kshatriya Sabha caste association was formed and the Kolis were mobilised by invoking the 'Kshatriya spirit'.

**T**he Congress party was pressurised to allocate positions to the members of the Kshatriya Sabha since their numerical strength in electoral politics could not be ignored. But the Patidar lobby within the party created many a hurdle in the path of aspiring Kshatriya leaders. They were not given membership books to enlist members in large numbers. Further, technical objections were raised to disqualify the Kshatriyas who had enrolled as members. To top it all, the Kshatriyas were branded as 'communal' for demanding positions in the party and state assembly.

In the sixties, the Swatantra party exploited this Kshatriya dissa-

TABLE 2

Occupations of Persons by Caste in Rural Areas Whose Families do not Own Land

\* Those who reported agriculture as their main occupation but not owning land.

tisfaction against the Congress by giving them positions in the party as also party tickets for the assembly elections of 1962 and 1967. Later, after the Congress split, Indira Gandhi gave more importance to the backward castes to win elections. The Congress(I) evolved the KHAM strategy, an alliance of the Kshatriyas, Harijans, Adivasis and Muslims for electoral purposes. Subsequently, other political parties, such as the Janata Dal and BJP, followed suit in appeasing the backward castes. As a result the strength of the OBCs in the state assembly rose from 7% in 1962 to 27% in 1991, whereas the proportion of Vaniyas and Brahmins went down from 32% to 14% during the same period. The Patidars somehow managed to maintain their strength.

**H**owever, the number of ministers from the forward castes remained high. The strength of the OBC ministers increased, though it did not go beyond 9% whereas the number of ministers from among the Patidars jumped from 6% to 24% during the last three decades. Ministers from Vania and Brahmin castes continued to hold important positions.<sup>2</sup> The overall domination of the forward castes in holding on to positions of power continues despite the electoral mobilisation of backward castes. But the OBCs have not given up the fight to get their due share of power.

With the rise in the levels of education and urbanisation, the second generation of dalits have become more assertive about their rights. The lifestyle of the urban educated dalits has changed. They dress, speak and behave like the middle strata of the upper castes and lay stress on human dignity. Not surprisingly, this change

was resented by the forward castes as well as the OBCs leading to greater intolerance. Moreover, the dalits' assertion of their rights over land, for high wages and use of common property resources and public places as equals was strongly resented by the non-dalits.

**C**onsequently, the cases of atrocities against dalits have increased during the last 25 years, though the blatant practice of untouchability in the public spheres may have declined. When dalits insist on entry to temples, celebrate certain festivals, or use common water facilities, they are often beaten up. The cases of murder and rape of dalit women are not uncommon. During the anti-reservation riots, dalit houses were set on fire in a number of villages. As many as 30% of the village panchayats still observe open or subtle discrimination in relation to elected members belonging to SCs.

Through various means the forward castes have consolidated their dominant position. The disunity and the conflict within the OBCs, SCs and STs has made it easier. Thus, the tribals fight a lone battle against the state and

the dominant castes. This has facilitated forward caste integration and its emergence as a single bloc unlike the deprived castes.

Inter-caste conflicts get softened by communal clashes between the Hindus and Muslims. The Muslims constitute nearly 9% of the population in Gujarat. There are sharp economic differences within the community with nearly one fifth of the Muslim cultivators being rich peasants. In business, their proportion is next to the Vaniyas, though in big industry they lag behind the Patidars. At the same time, among the farm and non-farm workers, their proportion is sizeable, close to that of the OBCs. In urban areas 11% of them are blue collar workers. Their proportion in self-employed professions and white collar jobs is as low as that of the OBCs and SCs.

**T**he history of riots between Hindus and Muslims in Gujarat can be traced back to the late 18th century. But the earlier conflicts were localised and usually confined to one or two social groups of both religions. The riots had not resulted in the Hindus or Muslims automatically splitting into opposite

TABLE 3

Caste and Occupation of Workers in Urban Gujarat						(Percentages)
						N = 14,725
Castes	Business	Profession	White collar	Blue collar	Others	Total
Brahmins	10	14	34	4	38	100
Vaniyas	28	4	21	4	43	100

2. Nagindas Sanghavi, *Gujarat: A Political Analysis*, Center for Social Studies, Surat, 1996.

camps; nor did they assume nationalist overtones. However, during the British and post-British period the leaders of both the communities attempted to mobilise different segments of the community as one unified group against the 'other'.

The first major communal riot in post-independent Gujarat took place in 1969. In the seventies, when the state was engulfed by a number of agitations around the issues of price rise, corruption, authoritarian rule and so on, communal conflict was at a low ebb. It began to rise again in the eighties and spread to rural areas on the issue of Ram janmabhoomi. Tribal areas too were affected. During these riots the forward and deprived castes joined ranks against the Muslims. This was the result of a long drawn out strategy of Hindu nationalists to build unity around Hindutva.

**D**uring the last three decades a number of organised efforts were made by social and religious 'reformers' and founders of various sects to forge unity across sects and upper and lower caste Hindus. The Bharat Sevashram, Hindu Milan Mandir, the Swadhyay sect and other similar organisations rejected the notion that shudras occupied inferior and degraded positions, though they did not eschew the caste system.

According to the Bharat Sevashram, low caste Hindus were hard working, strong and able to bear much suffering. 'Because of their numerical strength, they are truly the spinal cord of Hindu *jati*, i.e. race. Lakhs and crores of these people are getting dissociated from Hindu *samaj* because they are humiliated and looked down upon. As a result Hindu *jati* is becoming weak and powerless.'<sup>3</sup> They are

the real Kshatriyas who in the ancient period protected Hindu *samaj* against all calamities, aggression and shocks. According to the RSS, 'We are one... We are Hindus. Where is untouchability? For us, all are Hindus and nothing else... There is no varna of the *chaturvarna* or of caste. Today we have only one varna and *jati*, that is Hindu.'<sup>4</sup> The Vishwa Hindu Parishad exhorts: 'All Hindus should unite against *vidharmis*...'

**T**he proponents of this ideology seem to have succeeded in forging unity among the forward and deprived castes during the riots and mobilisation on the Ayodhya issue. They also managed the support of a sizeable section of dalits and OBCs, particularly their upwardly mobile strata, in the 1995 and 1998 assembly elections. Of late, the Sangh Parivar, the state machinery and printed media have launched a campaign against and persecuted Christians and Muslims. 'Facts' have been manufactured to malign the minorities as wicked, anti-social and treacherous. The Sangh Parivar has to some extent succeeded in sharpening social polarisations along communal lines.

But that does not mean that conflict of social and economic interests between the forward and backward castes/classes is dormant and can be wished away for long. In fact, tension within the BJP which led to a revolt by Shankarsinh Vaghela, or the present-day factional fights at all levels within the party, are manifestations of conflict on caste/class lines. The BJP, given its ideological framework and organisational structure, cannot hold power for long by harping on communal conflict alone.

# Ecological concerns

HASMUKH SHAH

GUJARAT exhibits a wide variation of geo-climatic environments. It is endowed with a great diversity of natural ecosystems ranging from deserts (including scrub-forests, grasslands, *ranns*) and coastal (including mangroves, coral-reefs, estuaries) to forests (including dry deciduous, moist deciduous and evergreen). These ecosystems harbour important habitats for a variety of plants and animals, including several rare and endangered species.

Economically, Gujarat is one of the richer states of India. It is believed that the state is, or would soon be, the number one industrial state of the country on several counts, including the proportion of workforce in industry and per capita industrial output. Also, with over a third of its population living in urban areas, it is among the more urbanised states with a network of about 225 urban centres.

The high levels of industrialisation and urbanisation also means larger demands for energy, water, land and infrastructure. As industrial activity gathers momentum in some of the less industrialised areas such as the coastal belt, ecologically important and fragile areas will face serious threats. Some of them like the thorn

forests in Narayan Sarovar, the habitat of the Asian wild ass, the breeding grounds of flamingos or the rare coral reefs in the Gulf of Kutch are the last remnants of their kind.

The demand for natural resources and their products in urban areas is high, especially resources such as fuel, timber, procured food and their products. Earth work, changes in drainage pattern, plantation, construction and waste disposal place stress on the natural ecosystems, resulting in a process of degradation and pollution of the area.

Economic development has not been an unmixed blessing anywhere. While several sections of Gujarati society enjoy an improved quality of life, the predominance of polluting industries – such as textiles, chemicals, hydrocarbons, pharmaceutical and cement – have an adverse fallout. The extensive withdrawal of groundwater in certain areas, overall hydrologic imbalance and population and livestock pressures have led to a process of desertification, increased soil salinity, drying up of traditional water sources and depletion of biodiversity. Gujarat's ecological health therefore, is a matter of some concern.

Two major controversies have contributed to sully the image of Gujarat as environmentally insensitive. One, the opposition to the height of the Narmada dam, and two, setting up of the Sanghi cement plant in an erstwhile protected area. Effective action on the part of NGOs and CBOS in the state, extensive public interest litigation resulting in strong judicial pronouncements, remedial actions initiated by the state government, setting up of institutions such as the Gujarat Ecology Commission (GEC) and the Gujarat Institute of Desert Ecology (GUIDE), excellent work in watershed management and recharging of wells, overall increase in green cover and other positive developments have unfortunately received little attention.

**L**et us examine the state of Gujarat's ecological health, particularly with respect to key elements such as air, water, land and biodiversity.

Air quality in urban centres is far from satisfactory. The sulphur oxide (SO<sub>x</sub>) concentrations considerably exceed the norms (80 and 60 micro grams per cubic metre for industrial and residential areas respectively) in the industrial areas of Ahmedabad and Vadodara. Similarly, the nitrogen oxide (NO<sub>x</sub>) levels in Ahmedabad, Vadodara and Surat exceed maximum permissible limits (80 and 60 micro grams per cubic metre) for industrial and residential areas respectively. Particulate concentrations are higher than permissible in all the three cities (360 and 140 micro grams per cubic metre for industrial and residential areas respectively).

Further, even in rural areas, with the use of fuelwood and crop residues as fuel, there is considerable pollution in terms of suspended particulate matter (SPM) and noxious gases. Rural women bear the brunt of this pollu-

tion. Kirit Parikh observed that since more than 80% of the rural population depend on such non-commercial energy (NCE), the magnitude of pollution in the kitchens is significant. The cumulative effects of pollution in rural homes is high and serious enough to merit greater attention.

**L**arge parts of the state (north Gujarat, Kutch and Saurashtra) are drought prone with low and erratic rainfall. High variation in rainfall—in terms of locales, timing and quantity—within the state results in skewed availability of water resources. It is evident that the water needs—agricultural and industrial—cannot be met from the water available in each region. Large scale and 'mega' irrigation projects have thus become central to the solution of the problem. It is in this context that the Sardar Sarovar Narmada Project (SSNP) has captured the imagination of the people of Gujarat at all levels, from the grassroots to the highest levels of political decision-making and evokes strong support within the state.

Unfavourable geomorphologic conditions not only create shortage of surface water but also result in poor groundwater recharge. Evaporation rates are high, varying from 1.9 m/year in south Gujarat to over 2.3 m/year in Kutch and northern parts of the state. As a result, the groundwater resources are relatively limited and almost fully exploited in some parts of the state. Despite the fall in groundwater tables, efforts to drill more bore wells show no sign of tapering off.

Due to the discharge of effluents from industrial estates and disposal of untreated sewerage, the lower stretches of the Sabarmati, Khari and Dhadar rivers have become highly polluted as have the Mahi, Narmada and Tapi rivers. While the water quality in most rivers is unsatisfactory

in terms of the Biochemical Oxygen Demand (BOD), of greater concern, perhaps, are the levels of coliform count—an indication of the large quantity of untreated sewage that is dumped into these rivers.

The State Pollution Control Board and the state government have initiated several steps to control the increasing water and air pollution. The main sources of waste water are the municipal areas and the chemical industry estates. It is necessary that the requisite facilities for collection, treatment and disposal of effluents, such as common effluent treatment plants, be established in the industrial areas.

Further, there is a marked decline in the quality of groundwater in many parts of the state. The entire coastal belt of Gujarat is beset with problems of high salinity. A high fluoride content, associated with the geochemical nature of rocks, affects nearly 15 districts. The heavy withdrawal of groundwater has only worsened the situation.

**T**he net sown area in Gujarat during 1994-95 was around 96,087 sq km, i.e. less than 50% of its total geographical area. While the introduction of high yielding varieties helped increase grain yields to significant levels wherever irrigation water, fertiliser, agricultural machinery, pesticides and related inputs are provided, the droughts of 1985 and 1987 made clear that without abundant water these new varieties produced less than the old native ones. Extensive monocultures devoted to a single variety are far too susceptible to insect and disease attacks—despite or because of the massive use of pesticides.

Further, the water intensive cropping patterns have introduced new vulnerabilities like soil erosion and soil degradation in a number of areas. Remote data sensing reveals

that more than 78,000 sq km or 40% of the total area is degraded. Studies carried out by GUIDE (1996) concluded that the process of desertification is on the rise in Kutch and Banaskantha districts.

The area under forests is nearly 10% of the total land area of the state as against the national average of 18%. The per capita forest area in the state is 0.06 hectare as against the all India average of 0.13 hectare. Between 1950 and 1975, a nearly 4.1 million hectares of good forest was lost, including to agriculture.

**B**iodiversity forms the basis of life and development and plays an important role in protecting the resilience of ecological systems. Unfortunately, there are no major studies on the biodiversity and natural history of Gujarat. Scattered studies carried out in universities and other institutions are rather limited in scope, confined to a few species or a group of species in select areas. Recently the Gujarat Ecology Commission estimated that records exist for about 7040 microbial, 4300 floral and 2700 faunal species in the state or five, eight and four per cent respectively of those estimated for the country (GEC, 1996).

The floral richness is mainly attributable to the variety of niches available. There are nearly 2,200 species of higher plants belonging to 902 genera and 155 families representing 12.9% of the floral diversity of the country. A large number of mangrove species – as many as 27 – have been identified in the coastal regions of the state. The published records indicate that 53 species of plants are rare and restricted to certain localities only.

We now examine the conflict of interest in the exploitation of natural resources. Different perceptions lie at the roots of any conflict, and Gujarat

is no exception. It may be worthwhile to reflect on the reasons for such differential perceptions.

Despite a history of a fractured socio-political set up Gujarat enjoys a legacy of outstanding leadership. This has contributed to the emergence of different schools of thought on development, ranging from the traditionalist to the post-modernist, who not only set different goals but also propagate the adoption of diverse routes.

The state also has a strong organisational ethos traditionally passed on through a variety of non governmental organisations that work for social, cultural, economic, and even religious purposes. These community groups and organisations have, therefore, provided a ready vehicle for the acceptance and propagation of the different ideological schools.

**D**evelopmental efforts in the state have obviously failed to take due cognisance of this multiplicity. Instead of trying to forge a certain level of consensus with different stakeholders on important issues, state planning relied mainly on the verdict of the people's elected representatives. Any dissent was viewed as politically motivated, fit to be ignored. A natural corollary of this being reduced communication, it led to serious restrictions in the availability of information. Lack of proper information or only partial information often lies behind misinformation campaigns, which make for an environment of mistrust and ultimately to situations of conflict.

The levels of concern among the entrepreneurs for their products and by-products (chiefly wastes) are often quite different. This corporate insensitivity has led to serious conflicts in many cases. The case of Maradiya Chemicals at Sayla is a classic example of how toxic effluents were

released in the open, creating serious problems of land degradation and contamination of groundwater. For people in the neighbourhood, the productivity of land and the quality of water resources is of prime concern for the simple reason of survival. There are many other such cases, even in GIDC industrial centres, which have provoked the local people to take up cudgels, chiefly through agitation and public interest litigation.

Though pollution remains a major rallying point against many of the industrial units, the spin-off from such debates often broadens the scope to include questions related to allocation of natural resources, equitable distribution of wealth, protection of wildlife and conservation of traditional systems. Serious concern is expressed when water is made available for industrial purposes. Similarly, when bulk quantities of mineral resources and forest produce are diverted for commercial use, questions are raised about the rights and aspirations of the local people.

**W**hile these issues directly impinge on human welfare, a major concern has emerged about the protection of wildlife and conservation of traditional systems. The protracted legal battle on the issue of denotification of the Narayan Sarovar Sanctuary is a case in point. While the government rightly perceives the industrialisation of Kutch as a major step towards the uplift of this backward area, prominent environmental NGOs and individuals also rightly see it as the destruction of the last major chunk of wilderness in the state. The conflicts revolve around threats to natural habitats, conservation of rare and endangered species and accelerated pressures on a fragile ecosystem.

The issues raised while opposing the height of the Sardar Sarovar

dam provide a classic example of differential perceptions of development at the local level as against the larger interest of the state or nation. Activists stress issues related to human resettlement, the use of forest areas as current means of livelihood for the local people, and the breakdown of traditions. While the state is committed towards a just and comprehensive rehabilitation programme, the conflict around Sardar Sarovar has, nevertheless, opened up and perpetuated debates on a much wider front.

Finally, some sections question the entire approach towards development that is currently being followed in the state. They propagate the adoption of organic farming systems, greater reliance on local resource management, enhanced participation in decision-making processes at all levels and so on. Against this backdrop the government is working for the accelerated economic development of the state more successfully than in most other states.

**T**he major players in this drama are the politicians, bureaucrats, entrepreneurs, people whose land has been acquired and who suffer due to water and air pollution, NGOs/CBOs, media and the judiciary.

The politician has shown greater concern for economic development as compared to protection of environment in the belief that industrialisation will generate more employment and higher revenues to the state – both politically important. The argument is that if the choice were between the survival of *agarias* (salt workers) and survival of the wild ass, the former would get preference. Or, if the choice was between a large cement plant generating employment and revenue on one hand and a few *chinkaras* or a dry thorn forest on the other, the cement plant would get precedence.

When the life span of a government is short (Gujarat has been ruled by seven chief ministers and once by a governor in the last five years) and elections become more frequent, political will gives place to political survival. The politician does not consider the long term implications of his decisions. In fast changing fortunes the politician has no time to look for solutions which can provide for coexistence of *agarias* and the wild ass or the cement plant and the dry thorn forest with acceptable adjustment on both sides.

**T**here are few politicians in the country who understand the complexities of environmental issues and their long term ramifications. This is largely because there has been little effort to inform people or their elected representatives on environmental issues, as was done by Jawaharlal Nehru in the 1950s for economic planning or about the use of science and technology to improve agricultural productivity.

Unfortunately, the politician is often kept at an arms length by the environmentalist. Rarely are elected representatives invited to workshops, conferences and seminars on environment. The politician no doubt has his own priorities of survival. But it must be conceded that rarely does a minister turn down a good environmental project if it is packaged with an orientation in favour of *adivasis* or the landless. The message, as one civil servant put it, is to correlate the environmental interest with that of the politician's to provide employment or access to resources like fuel and fodder to the poor.

The bureaucrat's job is to articulate the legislation, policies and programmes. While the politician incurs the wrath of environmentalists, the bureaucrat prepares the defence. By

training he is expected to carry out the policies of the government and not the personal wishes of political masters. But in reality, political pressure builds up with obvious consequences. Also, in the value system that has evolved over five decades, most bureaucrats prefer to work in departments dealing with industrial development or finance. There are few takers for agriculture, and even less for education or health. Barring some honourable exceptions, the department of environment is rarely the first choice. Nevertheless, some officers have tried to do justice to the given charge as disciplined soldiers, some have even suffered in the process. Recently, the position of the bureaucrat in Gujarat has been rather unenviable, as he has to spend considerable time in dealing with litigation leaving less time for developmental work.

**T**he entrepreneur wants a prime location for his unit irrespective of whether it is within or near a protected area, tourist site, near a holy shrine, or close to an urban area. The state government, in its eagerness to attract investment, is inclined to oblige the entrepreneur. However, given current regulations, the entrepreneur has to agree to all the conditions to protect environmental quality. In practice, some of them do take short cuts, or transgress the laid down limits. Some companies, making huge profits, have not hesitated to pump their highly toxic effluent into the earth with disastrous consequences. When such units were sought to be shut down, often the plea was to keep them going to protect the interest of workers. In such cases the entrepreneur's concern for his workers, who are normally denied even minimum safety equipment, is rather touching. Very few units have on their own followed rigorous environmental standards.

The people who lose their land are the worst sufferers since they forever lose the ownership of the means of production. The compensation that they receive is often used up in non-productive pursuits. There are no schemes for a profitable deployment of compensation. In some cases, mainly public sector, one member of the land loser's family may get a job. But other owners as well as the landless become unemployed. They are generally not equipped to find a place in the new industrial society.

**T**he neighbourhood communities who are victims of air and water pollution and soil degradation have for long suffered silently. In many cases the village wells and other waterbodies have been contaminated. In some cases sustained air pollution has caused diseases. Land degradation due to solid waste disposal or release of non-treated effluent and settling down of fine particles due to air pollution is evident in several areas. Unfortunately, when these people agitate, local leaders or toughies are brought into the fray. In some cases common community amenities are provided on a modest scale to assuage feelings.

NGOs in Gujarat are largely engaged in spreading awareness or in formulating and implementing specific projects in identified areas. Some, like the Centre for Environment Education (CEE), Aga Khan Rural Support Programme (AKRSP), Shree Vivekananda Research and Training Institute (VRTI), Development Support Centre (DSC), Sadguru, Mahiti-Utthan have an excellent track record of creating awareness and/or implementing projects of far reaching importance in certain areas. Their success in informing people or their representatives, sensitising the bureaucracy and the entrepreneur or pro-

jecting the interests of neighbourhood communities has however been rather modest. Only in the recent past have NGOs and CBOs successfully taken up the cause of environmental pollution and projection of neighbourhood suffering as in the case of Sanghi Cement, Maradia Chemicals, Jetpur Sari dyeing units, Vatva-Odhav-Naroda industrial estates and industries around the Narmada estuary. Besides the NGOs listed above, mention may be made of the Consumer Education and Research Centre (CERC) and the Manaviya Technology Forum (MTF) in taking up the cause of neighbourhood communities.

**T**hough the media has highlighted environmental issues, the priorities and emphases of the vernacular and English language media differ. The electronic media has helped to create general awareness about the wonders of nature, but local issues affecting the life of the viewer rarely get aired. Also, consistency or objectivity in environmental reporting is rarely discernible. Negative stories get wider coverage while positive developments are seldom reported.

NGO and CBO activism and extensive litigation with regard to industrial pollution in the mid-90s has, after initial resistance, led to several positive developments in Gujarat. Industrial units have realised that they cannot pollute the air and water and indiscriminately discharge toxic waste. Though not necessarily out of concern for the environment, the industry has, due to judicial pronouncements, initiated measures to contain pollution within permissible limits.

Some industry associations have taken the initiative to set up common effluent treatment plants (CETPs) in their estates. Gujarat now claims to have the highest – almost 95% – compliance in pollution control in 17 CPCB classified industries. The first

hazardous waste disposal site in the country has been commissioned and 17 others are being developed. Treatment of hazardous waste at three locations has been completed for the first time in India. CETP's are in operation or under construction at 14 industrial estates. Gujarat is the first state to commission a GIS based hazardous waste tracking system. There are several other initiatives which have been taken up by the state government and GPCB. Studies of carrying capacity of certain areas have been undertaken. As a result there has been a sharp drop in litigation and closures. Gujarat is also planning to set up an institute on the lines of NEERI.

All this does not mean that everything is well on the pollution front. While action on various pollution litigations has been initiated, their success will depend on rigorous monitoring and deterrent action against erring units. It will be an acid test for all the regulatory mechanisms as well as of NGOs, CBOs and the media. While the ground realities are not ideal, there are clear signs of improvement

**G**ujarat started this decade as perhaps the state with the most unenviable record of industrial pollution. But it is likely to end it on a much more positive note. Compared to other states, Gujarat is poised to emerge as a cleaner state in terms of industrial environment within a decade.

The real concern, however, is about non industry-related ecological degradation, despite the excellent track record of NGOs in watershed development and recharging of wells. The increase in salinity, accelerated desertification, loss of marine biotic wealth and the depletion of biodiversity are areas of concern, particularly since the process is gradual and decision-makers may wake up to the danger too late.

# Images of Gujarati women

SONAL SHUKLA

*Jab kutte par sassa aya, tab badshah ne shahar basaya* (The king decided to establish a city where a hare confronted the hound), goes the old adage. Legend has it that the Sultan of Gujarat while on a hunt in a forest witnessed a hare who, instead of being scared and running away, turned to face and attack the hound. The Sultan was impressed. He felt that there was something unique about a soil that gave birth to such courage and bravery, even in a timid creature like the hare. He, therefore, decided to build a

city and settle a community of brave and courageous people. The name of the Sultan was Ahmedshah; the city came to be called Ahmedabad or Amdavad.

What the legend does not mention, but what is likely (if one subscribes to such legends) is that the hare was actually female. This could easily, maybe naively, explain the presence of many courageous and dynamic women in this city. Ahmedabad, though the name itself is now caught up in the renaming turmoil of revivalist politics,

has produced many great known and unknown women.

Anasuya Sarabhai was possibly the country's first woman trade unionist. Even though she was herself a great admirer of Mahatma Gandhi and considered herself his follower, the Mahatma was a mere observer when, in 1917, she organised the first labour action against the textile mill owners in Ahmedabad, one of them owned by her own family (Shukla 1973, 56). Mrudula Sarabhai, together with Charumati Yoddha and others, established the Jyoti Sangh in 1934, the first militant organisation to fight against wife battery in India. Jyoti Sangh trained women volunteers and social workers to rescue women in distress (Basu 1996, 70). Mrudula Sarabhai is well-known for her role in managing the exchange of women kidnapped after the Partition and for her support to Sheikh Abdullah on the issue of Kashmir. The latter earned her imprisonment and oblivion.

**C**ountless women in Ahmedabad broke away from traditional constraints and taboos to join the Independence struggle. In the seventies, Ela Bhatt brought together women in the unorganised sector to create SEWA, the Self Employed Women's Association. The courage of these poor working women who pull carts, carry huge head loads and are engaged in all kinds of dangerous and backbreaking work is astounding. So is the business acumen of women hawkers and street vendors in Ahmedabad.

There are, of course, other explanations for the 'heroic' actions of Ahmedabad's women. The fact that Ahmedabad was the second largest centre of textile mills created certain socio-cultural conditions for women to live and work in. Women formed 20% of the workforce in the cotton mills in the 1920s (Jhabvala 1985, 27).

Gandhi chose to settle down in Ahmedabad after his return from South Africa in 1915 and lived there until the Salt March in 1930. His involvement with Ahmedabad society encouraged middle class women to participate in political activities.

There are many myths about the women of Ahmedabad and about Gujarati women in general. It is said that they are modern, adaptable to new ways, that they whizz around in their two wheelers and cars, and can drive hard bargains. Other impressions about them are that they are great travellers, enjoy mountaineering, study abroad, join their fathers' or husbands' firms, even start their own business. Also that they are articulate, aggressive and visible in public life. Middle class Gujaratis in towns and cities of Gujarat as also the Gujarati diaspora in Mumbai and outside India too share this view.

'Are there poor people in Gujarat also?' Our maid in Mumbai exclaimed when informed that our guest worked for the rights of the poor. Mumbai has a special relationship with Gujarat. For years after the state was formed in 1960, Mumbai had more Gujaratis than any city in Gujarat and set the trends and fashions. Gujaratis in Mumbai and other parts of rural and urban Maharashtra have done well financially.

**T**here are few Gujarati mill and factory workers in Mumbai even though many of them are owned by Gujaratis. Apart from the Municipal Corporation where a large number of sweepers are of Gujarati origin, there are only clusters of a few thousand Khumbars, Dubla adivasis, Kolis and Vaghris and other people from backward communities of Gujarati origin in the various shanty towns of Mumbai. The rest are upper caste people belonging to the upper and middle class.

The Gujarati middle class is more prosperous than its Maharashtra counterpart. Gujaratis own most of the retail shops and, along with the Marwaris, control most of the wholesale trade in Mumbai. Until recently these communities did not employ women. Though there were women teachers in schools and colleges and some Gujarati women in banks and other offices, the general impression was that middle class Gujarati women did not go out to work. However, in the last decade, Gujarati sales-girls in fancy jewellery shops and departmental stores and in big and small offices are a common sight. Economic pressures and a desire for better living standards have helped break the earlier reservation against middle class women going out to earn a living. One belief is that businessmen have realised that employing women reduces the risk of employees becoming rivals after learning the business and making contacts.

**P**oor Gujaratis no longer migrate to Mumbai. One does not come across new colonies of migrant workers from Gujarat in the towns and cities of other states. They either migrate to industrial centres within Gujarat or continue living as rural labour. The silent majority of invisible Gujarati women come from these communities. They carry a double burden of the traditional prejudices against women as well as the pressures of modern life generated by the anti-dalit, anti-minority and anti-poor policies of the ruling class.

There are sharp cultural differences between the three main regions of Gujarat – Kutch, Saurashtra and Kathiawad. Within Gujarat state or among Gujaratis, a Kutchi or a Kathiawadi will rarely identify himself/herself as a Gujarati. This is confusing for those unfamiliar with the context,

because the term Gujarat refers to the entire state as well as to the Gujarat region stretching from Vapi in the south to Banaskantha in the north.

Most of the industrial development has taken place in this region. Parts of the Gujarat region were modernised during British rule. Saurashtra, though smaller in size, was divided into over 200 princely states. More than a third of the 500 odd princely states in India were in Saurashtra, many retaining characteristics of medieval culture. Kutch has vast desert areas and many colourful but poor communities pursuing their professions in agriculture, traditional handicrafts, raising livestock and working on government projects. Kutch was under the rule of a single Rajput king. Its business communities – Baniyas, Bhatias, Lohanas and Khojas – have largely moved to Mumbai. However, the port area of Kandla and its export zone offers some employment as do the salt works.

**T**raditional Gujarati crafts like *bandhani*, colourful hand embroidery and applique work have been best preserved in Saurashtra, Kutch and north Gujarat, mostly by women. Saurashtra is also famous for its *garbas* and other folk songs. But, these regions retain many restrictive traditions for women. Caste panchayats, with their strong patriarchal powers, govern the lives of women of middle and backward communities all over Gujarat. In more backward regions they command a stronger hold on social life.

Saurashtra reportedly had the highest suicide rate among women in the country. It leads Gujarat in suicide among women even today (*Times of India*, 22 August 1997). As in Rajasthan, women from many communities have to cover their faces. Economic hardship does not permit seclusion of women and confining

them at home. But in the evenings, one comes across women in Sabarkantha and Banaskantha districts carrying huge loads of fodder and fuel on their heads and walking long distances with their faces completely covered in *ghungat*.

**M**odern development superimposed on a basically unchanging feudal structure adds to the woman's burden. During the long drawn drought in the eighties, women in Kutch not only worked on road construction along with men and performed their traditional tasks of cooking and fetching water but, since the villages were now electrified, they were also engaged in embroidery work until midnight through an additional drought relief programme (Shah and Jani 1987, video).

Modern educational institutions came up in areas which were directly under the British. Few princely states, with the exception of Baroda during Sayajirao Gaekwad's reign and to an extent Bhavnagar, laid stress on education, especially women's education. Most parts of Saurashtra did not even have a high school in the 19th and early decades of the 20th century. While many upper caste communities opened free or low priced hostels for boys of their communities, girls, even those from wealthy upper caste families, at best received some primary education.

Gaekwad, on the other hand, provided free and compulsory education for all in Baroda state and further supported education by a network of libraries. For many years after Independence there were families in the former Gaekwad areas of Baroda, Amreli and other parts of Saurashtra where a grandmother could read and write while the mother and daughter were illiterate. North Gujarat, which shares a border with Kutch and

Rajasthan, remains the most backward district of Gujarat. At 18.9%, it has the lowest female literacy rate in the state.

Gujarat has no tradition of dowry among the Brahmins and the Baniyas. The one exception is the Anavil Brahmin community in south Gujarat with a system of dowry in cash and gold. The Anavils, also known as Desais, are not considered proper Brahmins since they cannot perform religious rites and rituals. The Anavils have been land owning farmers and administrators (Ghaswala 1993, 9 and Van Der Veen 1987, 26).

**T**he other community, apart from the Rajputs, who exchange dowry are the Leva Patidars or Patels of Kheda district in central Gujarat. They profited from cash crops like cotton and tobacco in the 19th century. Many Patels immigrated to Africa, Fiji and New Zealand during the colonial period and, in the last forty years, to the UK and USA. The community produced amongst the earliest advocates and administrators. Unlike Anavils, the Patels have become more powerful in business and politics after Independence.

Rajputs hail mainly from Kutch, Saurashtra and north Gujarat regions. Female infanticide was rampant among them for two reasons. One was the large dowry that had to be paid for getting daughters married. However, one could not marry within the same *kula* and, according to the rules of hypergamy, a girl could not be married into a lower *kula*. The higher the *kula* status of the bridegroom, the higher the dowry demanded.

The governor of Bombay had to legislate against female foeticide. This was objected to by the Rajputs. The Rana of Kutch wrote to the governor arguing that since his Jadejakula was the highest in Rajput hierarchy,

it had no alternative but to kill its daughters (Oza 1983, 29). Other Rajputs claimed exemption on grounds of poverty. Finally, with fines levied on guilty daughter killers, to which the British government added a substantial grant, a dowry fund was set up for poor Rajputs.

It is well established that female infanticide was traditionally not confined to Gujarat or to the Rajputs alone. It was also prevalent among some of the richer and more powerful Leva Patidar families (Desai 1983, 292). The Gujarati practices were documented because of the interventions of a British governor in the 19th century. However, two points are of interest since they indicate a certain attitude to women's right to survival. One is that the princes, who enjoyed substantial autonomy within their fiefdoms, protested against a ban on female infanticide and used their power and status to counter the mandate of the governor and so continued with the practice.

The other is that social reformers, who were quick to seek support from the British on issues such as women's education, widow remarriage or age of consent for consummation of marriage, did not take an active interest in putting an end to female infanticide. It would appear that the caste background of the reformers – mainly Nagar Brahmins, Banias or Zoroastrians – played a significant role. They had been influenced by modern institutions as students, teachers, lawyers, bureaucrats or traders. They lived in towns and cities with little connection to land and agriculture, whereas female infanticide was most prevalent among the feudal princes and their community or among rich farmers.

Even the question of dowry was rarely raised in public until Ishwar

Petalikar, a writer and reformer of Patel origin, took the initiative in the post-independence period. Unlike the popular novels of Sharatchandra in Bengal or Khandekar in Maharashtra, dowry never featured as a theme in the works of their Gujarati contemporaries like K.M. Munshi and R.V. Desai. Gujarat is the second most industrialised state in the country after Maharashtra. It also ranks third in violence against women after Punjab and Haryana (*Indian Express*, 22 August 1997).

In Gujarat, as elsewhere in the country, agricultural and artisan communities with a tradition of bride-price are now switching over to dowry. While dowry has not yet been formally introduced among Brahmins and trader communities, wedding expenses have increased, most of them borne by the bride's family (Shukla 1991, 246). Different agricultural communities who identify with Patels of Kheda district have adopted a dowry system. This is also true of a section of Anavils among whom dowry has increased with the spread of education. The Anavils were among the first upper caste communities to consider woman's employment in the organised sector as a part of dowry.

However, not all cases of gender violence are dowry related, though demand for dowry is routinely mentioned by women and their families in complaints. After the 1970s and '80s, the government had portrayed dowry as the main source of women's oppression. The chances of a complaint receiving attention are slightly better in such a situation.

A CID report, which records dowry deaths as a separate category, puts the figure at 63 for the year 1996. The cases of suicides among women stand at 1475 while registered accidental deaths are 2724. There are 345

cases of murder. 20 women die of burns in Gujarat daily. Between 1994 and 1996, 16,000 women died of burns and another 3800 attempted suicide by self immolation. (The euphemism for that in the Gujarati language is *agnisnan*, which, considering the ritual purity attributed to being enveloped by fire, is dangerous). The euphemism for killing infant daughters is *doodpiti* (a ritual involving pushing a girl's head into a pot of boiling milk and crying out that she choked while drinking it). As an Additional Director General of Police in the state CID, pointed out, the biggest challenge in burn cases is to determine whether or not they were accidental (*Times of India*, 22 August 1997).

A research study investigating unnatural deaths of women in Gujarat revealed that the largest number of such deaths continue to be reported from Saurashtra and Kutch. Harassment of married women by the matrimonial family also remains the main cause behind unnatural deaths of women (Bhagat 1990, 44). Of the 407 cases in which data on caste and religion was available for 1988, 355 were Hindu, 50 Muslim, one Christian and one Jain. 73 deaths were women from the upper castes and 63 were from middle castes. 32 were from the artisan castes and 94 from other backward caste categories.

Of the 482 cases in which information about reasons leading to death was available, 167 were attributed to harassment by in-laws and family disputes; 43 to conflict with husbands. The reason given in 8 cases was economic crisis, whereas 6 were killed because they were believed to have been witches. 62 were from scheduled castes and 26 from scheduled tribes. Out of 579 cases, 468 were married and 111 unmarried. The most vulnerable age group was 21 to 25 followed

by 26 to 45 (*ibid*, 25). A government committee which surveyed 4537 cases of suicide in Gujarat during 1960-64 reported that the incidence of women victims in castes such as Kanbi, Patel and Kshatriya Rajput was almost double that for men. The difference was also substantially higher among dalits and Brahmins (*ibid*, 64).

**B**oth studies indicate an eclectic distribution of unnatural deaths of women across castes. The six women who were killed as witches were most likely adivasi women. This practice is also prevalent among adivasis of Dahanaluka of Maharashtra adjoining Gujarat. An increase in the incidence of witch hunting is attributed to, among other things, pressures of modernisation, ecological destruction leading to failure of the traditional herbal cures, and making an old or rebellious woman a scapegoat (Kash-takari Sangathana 1984, 88). A desire to appropriate land is a major cause for witch hunting. Sexual harassment, kidnapping, rape and murder of adivasi women also takes place on development sites (Sres 1994, 1-28).

Why is there such a contrast between the public image of Gujarati women as strong and the level of violence they face? One can only make conjectures. The number of registered cases of violence against women may be greater than in other states but the causes that lead to violence and death are not any different from what is seen in other parts of India. But because of the public image of its upper caste and upper class women, Gujarati women are expected to cope better. The Gujarat case also confirms the belief that if economic development takes place without corresponding social progress women not only do not share the benefits of development, they are actually adversely affected.

The feminist movement of the 1980s had a limited impact on the state. After the early years, SEWA distanced itself from it. Apart from Sahiyar in Baroda which has a left orientation, and Astitva in Valsad which was formed as a spontaneous action by women who wanted to examine their own lives and those of women around them, most other women's groups continue to work as conventional NGOs.

The autonomous women's groups (AWGs) that came into existence as non-party political formations did not have a counterpart in Gujarat, although many NGOs now identify with AWGs. Most of the AWGs in Mumbai, Pune, Delhi, Hyderabad and Bangalore which came up in the '70s and early '80s were initiated by left-wing women. They had worked with left groups or parties on the issue of labour unions, democratic rights or community health. Their political experience contributed to raising issues of women's liberation. Unfortunately, there was no tradition of left politics in Gujarat. Apart from a Trotskyist group in Baroda and a few small far left groups, major communist parties or the socialists had no significant base in Gujarat. The participation of women's groups in the human rights movement in Ahmedabad too has been limited.

**W**as it the failure of Gandhism that ultimately gave birth to a new culture of violence? Gandhi was a product of a society which was in transition under colonial rule. He had a specially close relationship with Gujarat. All the progressive social and intellectual movements in the state were hegemonised by the Gandhian agenda. A more pluralist social movement might have helped Gujarat retain some of the other progressive tendencies after Gandhi's demise.

As it happened, from the 1920s all social reform and educational issues were interpreted by the Mahatma. At one point he even headed one of the most important literary institution, the Sahitya Parishad. But his leadership was unable to challenge or contain structural violence, oppression and injustice in the society and, therefore, did not have a substantial or long lasting impact on the status of women in the state.

**G**andhi has already been criticised for an anti-women workers' policy in the Textile Labour Association (Jhabvala 1985, 44). Although Gandhi had supported middle class women's organizations, his women supporters could not provide dynamic leadership to Gujarat after his death. During the Mahagujarat movement in 1956, for example, these women stated that their protest and participation was for supporting their men who had been dealt with violently by the police and the government. The women had no agenda of their own (Shodhan and Bhagat 1997). Community initiatives by Gandhians were confined to sarvodaya activities in rural pockets. These mainly related to land distribution, education and other development activity, without any specific reference to the empowerment of women.

There were some young women in the student-led Navnirman movement for social reconstruction in the early '70s. But by the 1981 riots against job reservation and seats in medical and other professional colleges, women were already participating in anti-dalit actions. This stand became more evident during the anti-dalit and anti-Muslim riots in 1985 (Women and Media Group 1985, 5). Incidentally, Gujarati middle class women actively supported the Ram Janmabhoomi and

other issues raised by the Hindutva lobby.

In Surat, on the other hand, where some of the worst anti-Muslim riots took place in 1993, there are no women's groups other than a branch of the largely apolitical All India Women's Conference. No local women's group emerged to fight communalism, even after various women's organisations visited Surat and submitted reports on the impact of riots on women.

**G**ujarat may not have the highest number of female infanticide cases any more, but there are many agencies at district and taluka levels to collect amniotic fluid for sex determination tests. The Gujaratis joke that while they go to Maharashtra to drink liquor which is not legal in their home state, Maharashtrians come to Gujarat for sex-determination tests because it is banned in Maharashtra to prevent female foeticide (Shukla 1991, 238).

Gujaratis even seem to accept bigamy more openly. The phenomenon of 'contract marriages' in the '70s was a Gujarati invention in which well-to-do married men made friendship contracts with young women from a lower economic strata. The former chief minister, Amarsinh Chowdhary of the Congress, contracted a bigamous marriage on the ground that as an adivasi he was governed by his customary law which permits polygamy. Even the Hindutva lobby did not object to this argument. A former president of the Gujarati Sahitya Parishad, a Brahmin, lived openly with two wives and even wrote about it in his autobiography (Bhatt 1988, 65). Despite this, he was elected president. The present head of the Gujarati Sahitya Akademi in Maharashtra is a Jain who, by his own admission, has two wives. (Selaraka 1988, 98). Both of them accompany him to public functions.

Thus, despite significant development in many areas, injustice and violence against women continue to be perpetuated, and tolerated, in Gujarati society.

# Garavi Gujarat

NIRANJAN BHAGAT

THIS essay endeavours to see Gujarat from far and near in terms of time and space, in terms of its history and geography; in other words, to see Gujarat as it was in the past and as it is at present. It is not an attempt to see Gujarat in all its multifarious aspects but only in a few select ones, which those who live in the state may take for granted and others who live outside are likely to miss, or misunderstand.

Gujarat is known as the land of the Banias, and rightly so, for it is they who symbolize Gujarat, form its image and foster its identity. At the outset, it is necessary to clarify that the Banias, like the Vaishyas, are not a caste but a community, a mercantile community which has dominated Gujarat and created a cultural climate – the Mahajan culture – in which the people of Gujarat have lived for centuries.

The origin of the Bania community can be traced to the Indus Valley civilization. There have been archaeological discoveries and excavations at Harappa in Punjab (1856), Mohenjo-daro in Sind (1922), Lothal in Saurashtra (1954) and recently at Dholavira in Kutch as well as in some other regions of Gujarat and Rajasthan (300 sites have been unearthed, of which 50 are located in Kutch, Saurashtra and Gujarat).

They reveal that a pre-Aryan civilization and a pre-Vedic culture existed in the Indus Valley and other regions of north-west India 1600 km north-south from Pakthan near Peshawar to Ambhore near Mumbai and 1100 km east-west from Dwarka in Saurashtra to Alamgirpur near New Delhi – between 3000 B.C. and 1500 B.C. No documents or monuments have been found and such relics as

seals, coins and script still remain undeciphered. Hence, little is known about its social structure, except that a predominantly mercantile community inhabited the Valley and that it had evolved a highly civilized society.

The Harappans came down from the Valley in the north to the sea-coast in the south around 2400 B.C. in search of fertile lands and potential ports. They developed Lothal as their most important port and, consequently, as a great city—as great as Mohen-jo-daro. These were different from the cities in Egypt and Mesopotamia. The civilization at Lothal survived till 1500 B.C., even though it vanished from the northern regions in 1600 B.C.

Lothal (the mound of the dead), 80 km south-west from Ahmedabad, discovered in 1954 and excavated from 1955 to 1960, is an archaeological marvel. It harbours debris up to a depth of 20 meters. It measures 284 meters north-south and 228 meters east-west. At the height of its glory it must have covered a wider area, as remains of habitation 300 meters away from the mound suggest. Among its many magnificent remains is a huge dock—a 218x37x5 cubic meter baked brick structure—superior to that of the Phoenicians and Romans in succeeding ages. The dockyard for berthing and servicing the ships could hold 30 ships of 60 tonnes each, or 60 ships each of 30 tonnes.

Its many remarkable relics – a mummy, an Assyrian's head, a seal with five ships sketched on it and seals of the Arabian and Sumerian cities and muslin and indigo found in the Egyptian pyramids – suggest that Lothal had overseas trade relations with Abbas, Bushayar, Behrin, Susa and Sumer. Lothal was, indeed, an international trade centre. Its prosperity came mainly from trade in cotton and ivory beads. The ancient sea-farers of

Lothal are the ancestors of the Bania community and it is they who have bequeathed the legacy of sea-faring to the people of Gujarat.

Gujarat has the largest coastline and the largest number of ports of all the states of India. It has a 1663 km coastline, which is 30% of India's total of 5700 km. Gujarat is surrounded by the sea on three sides. Of its 19 districts, as many as 10 have a sea-coast. It is this geography which has governed its history.

In pre-historic times, the Mahabharata refers to Prabhas and Dwarka, the two oldest ports of Gujarat. Dwarka literally means 'the gateway'. Phoenician ships came to the sea-coast of Saurashtra and Assyrian ships went to Iran via Dwarka.

In ancient and medieval times, Gujarat had 52 active ports, of which Bharuch, Khambhat and Surat were the busiest. Gujarat had overseas trade relations with a large number of countries – Sumer, Phoenicia, Babylon, Egypt, Greece, Rome, Arabia, Iran, Maskat, Yeman, Hormuz and East Africa in the west and Lanka, Brahmadesh, Malaya, Burma, Java, Sumatra, Cambodia and China in the east. Buddhist and Jain writings and Kautilya's *Arthshashtra* mention the ports of Gujarat, the countries with which they had trade relations and the merchandise they exported and imported. Ptolemy's *Geography* and *Guide to the Red Sea* by an anonymous author provide detailed descriptions of the sea-coast of Gujarat. The latter even gives the Roman names of its major ports – Barik (Dwarka), Barigaza (Bharuch) and Kambayat (Khambhat).

Hsiuan-Tsang's *Travelogue* identified the sea as a major source of livelihood for the people of Gujarat. On the walls of a temple at Borobudur in Java a sculpture depicts the journey

of a few immigrants from Gujarat who settled in Java. On the walls of a cave at Ajanta a painting depicts the journey of Kumarvijay, the son of Sinhbahu, king of Sinhpur to Lanka which he renamed as *Sinhaldwipa*. History books in Lanka also record this story.

Gujarat was famous in the western world as 'the mistress of the sea' and the Saindhava community of Saurashtra as the 'lords of the ocean'. From the 11th to the 17th century, Bharuch was at the height of its glory. In the 15th century as many as 4000 ships passed through Bharuch. Next to Bharuch, Khambhat was a prominent port during this period.

In the 17th century, Surat surpassed both Bharuch and Khambhat. Traders from all over the world came to Surat. Muslim, Arab, Turkish, Iranian, Jewish, Dutch, Portuguese, English and Armenian traders had settled in Surat. The Parsis had already made it their home in the 11th century. The Muslim traders were the most outstanding among them – Virji Vora, Mulla Mahammad Ali and Ahmed Chameli. Pilgrims went to Mecca for Haj from Surat. Hence, Surat was known as Meccaidwar, Meccabari, Babul Mecca. In the 19th century the Portuguese, Dutch, British and the French had factories in these three famous ports. Earlier, a local pilot, Kanji, had guided Vasco da Gama on his way to India.

In the 19th century it was again the people of Gujarat, especially the Parsis, who developed Bombay as a port, which till recently accounted for 40% of India's marine trade. It excelled over the other ports of Gujarat including Surat. Lowji Nusserwanji Wadia, one of the world's greatest ship builders, was famous throughout the world. He was a foreman in a dockyard in Surat and was invited by the British to

Bombay in 1736. In Gujarati, Wadia, means a ship-builder. His sons and grandsons were also great ship-builders. One grandson, Jamshetji Bomanji Wadia had built a ship in 1800 A.D. which sailed the world's seas for years. Another grandson, Narowji Bomanji Wadia, built the battleships which the British engaged against Napoleon, including Nelson's battleship at Trafalgar – the 'Victory'. One of them still exists at Gosport near Southampton. Again, it was a Gujarati family which established the first Indian shipping company in Bombay in 1919 – the Scindia Steam Navigation Company.

**I**n the early 20th century, the Bania community established 66 textile mills in Ahmedabad, making it 'the Manchester of India'. In the late 20th century, Gujarat has the biggest port in India, Kandla, which handles three million tonnes of merchandise annually. It also possesses 40 small and medium size ports, which handle about 2 million tonnes of merchandise annually. This is 70% of the total merchandise handled by all other similar ports in India.

Gujarat ranks first among the states of India in industrial and infrastructural investment. Of the total investment of Rs 12,30,745 crore in 3700 units, Gujarat's share is 10.49% or Rs 1,33,763 crore in 430 units. Of the total investments in industry in Gujarat, the share of the chemical industry is 70%. Gujarat is poised to emerge as 'the chemical state' of India at the beginning of the next century. For centuries the state has fascinated foreign traders. Currently it has attracted investments of Rs 3,435 crore from multinational companies for trade, commerce and industry. Of the 1.5 million Indians who have migrated and settled in the UK and USA, 50% are from Gujarat.

As the poet Nanalal says, '*Mahasagarnan pruthvivishal/Sarovar Kidhan Gurjari ball*' – the people of Gujarat have turned the vast oceans of the world into small lakes. A popular rhyme says, '*Jave je konar gayo, nave mandirmany / Jo ave pachho phari, pariya pariya khay!*' – One who goes to Java, does not return. / If he does, he brings wealth which would last for generations. A popular phrase refers to '*Lankani ladi ne Ghoghano var*' – the bride from Lanka and the groom from Ghogha. Such are the heroic tales of adventure and enterprise of the Bania community of Gujarat! Such is the sublime saga of the seafarers of Gujarat!

It is neither the monarchs nor the generals, not the Brahmins or the Kshatriyas, but the Bania community and its culture which has socially dominated and economically dictated Gujarat for centuries. The land of Gujarat is fertile. But more than the land and agriculture, its prosperity comes from the sea and trade, commerce and industry, owned and organised by the Bania community.

**P**ace is a pre-requisite for prosperity. The people of Gujarat, therefore, prefer compromise and cooperation to conflict and confrontation. They are gentle and generous, not aggressive or assertive, nor stubborn or obstinate. They are broad-minded and large-hearted, honest and hard-working. They possess not only common sense but also unusual wit and worldly wisdom. They can solve a problem or resolve a crisis with patience and persuasion. They do not bear a grudge or harbour a grievance against anyone. Gujaratis would rather forgive and forget. They are humble and hospitable. They are tolerant and yet tactful; courteous and yet calculating. They can write off and give up but without writing off their dignity and

giving up their honour. They will meet the opponent or partner half way for mutual benefit. 'I give up half, you give up half, but let us go ahead' is their way of life. 'Live and let live. Earn and let earn!' is their motto. In a word, *kadado* (compromise) is the secret of the success of the Bania community.

**M**any immigrants and exiles, traders and invaders settled in Gujarat, which not only accepted but absorbed and assimilated them. The most striking example are the Parsis. Around 766 A.D. they fled Persia due to torture and persecution by the Arabs and migrated to Diu in Saurashtra where they stayed for 19 years. Once again, around 785 A.D. they migrated to Sanjan in south Gujarat as a result of terror and persecution by the Portuguese. They sought asylum and Jadi Rana, the ruler of Sanjan, offered them a cup full of milk, implying that Sanjan was already overcrowded and that there was no room for them. They added sugar to the milk and returned the cup to the ruler, suggesting that they would mix and mingle with the local people like sugar in milk. They were at once accepted and eventually settled in Navsari, Valsad, Udvarda, Surat, Bombay and many other parts of Gujarat and India.

The spirit of the Bania community and its Mahajan culture is embodied and expressed in one of the finest sayings in the Gujarati language: *Kajiyanun mon kalu* – the face of the quarrel is black, as also in some other sayings: *Vano Verine Vash Kare* – courtesy conquers all, even the enemy; and *Vaniabhaini nichhi muchh* – the Bania has a lowered mustache. In Nabhinandan's *Jinoddhar Prabandh* Gujarat is glorified as *Vivek Bruhaspati*, a perfect example of equanimity.

The formal expression and the finest embodiment of the culture of the

Bania community can be found in its mahajans (guilds). The history of the mahajans in Gujarat can be traced to the 16th century, though it could be even older, as old as the trade itself. The history of the mahajans of Surat and Ahmedabad is recorded in detail, including the names of their leaders – Virji Vora, Hari Vaishya, Abdul Gafur in Surat and Shantidas Jhaveri in Ahmedabad. Panchis, the artisans' guilds were caste-based, while the mahajans were not, being trade or profession-based. Their members were traders or financiers. There was no discrimination of caste, creed, colour, race or religion and their members comprised Hindus, Muslims, Jains and Parsis.

**T**he guilds were headed by *nagar-shethis* (city-heads), who formed a federation of guilds. They determined hours of work and wages, controlled prices, set holidays and festivals and managed educational institutions. They protected the rights and interests of their members, settled quarrels between individual members or mahajans and protected themselves against the state and fought against its tyranny and injustice.

In 1669, in Surat, the mahajan protested against the *Kazi* because he promoted the conversion of the Hindus and observed a week-long strike till Emperor Aurangzeb and the Kazi offered their apology. In 1816, in Ahmedabad, the mahajan observed a violent one-day strike against the Maratha rulers. Foreign historians have noted that emperors (Moghul, Maratha and British) may come and emperors may go but the mahajans of Gujarat go on forever!

In the last 100 years there have been four non-political strikes in Ahmedabad by textile workers over problems of wages: an eight day strike in 1895, 15 days in 1917, four weeks

in 1918 during which Mahatma Gandhi undertook a fast unto death and resolved the problem peacefully, and a 10 week strike in 1923. There was a unique 100 day political strike by textile workers in Ahmedabad against the British government as an integral part of the 'Quit India' movement launched by Mahatma Gandhi.

**A**s a consequence of the 1918 strike, the Majur Mahajan was founded in Ahmedabad in 1920 on Gandhian values and principles. Mahatma Gandhi was its member from day one till he died in 1948. He guided it as a model to be emulated elsewhere in India, making it one of the best organised trade unions in India. It has evolved a unique and highly successful system of industrial arbitration. For the last 80 years Ahmedabad has enjoyed industrial peace, as no other city in India – thanks to the Majur Mahajan which has inherited and imbibed the traditions of the old mahajans of Gujarat. The Ahmedabad Millowners' Association (now Ahmedabad Textile Mills Association) was established in 1891 and has been active for more than 100 years. The Gujarat *Vepari Mahamandal* (Gujarat Chamber of Commerce and Industry) is a federation which was founded in 1948. At present, about 300 mahajans and associations of trade, commerce and industry in Gujarat are affiliated to it.

Gujarat is protected by nature on all four sides: by mountains in the north, forests in the east, rivers in the south and the sea in the west. Hence, Gujarat has rarely been invaded, nor has it invaded others. The people have seldom engaged in warfare, being peace-loving.

In pre-historic times, as the Mahabharata, the mythical epic, says, Lord Krishna at a very young age migrated to Gujarat from Mathura,

established a kingdom of Yadavas and founded its capital city of Dwarka. In the last years of his life he returned to Gujarat after the battle of Kurukshetra. During the middle years of his life he only acted as a peace-maker. Even on the battle field he acted as a charioteer and not as a warrior, he only drove Arjuna's chariot though he possessed the mightiest weapon of war – the *Sudarshana*. This myth has made a great impact on the history of Gujarat. Buddhism and Jainism in ancient times, Vaishnavism and the devotional songs of the saints in medieval times and Mahatma Gandhi in modern times preached and practised love and compassion in Gujarat.

**M**ore than anything else, it is the culture of the Bania community comprising different religions, faiths and ethnic groups that has moulded the unique character and determined the peculiar nature of the people of Gujarat. For centuries they have displayed their heroism and prowess, a spirit of adventure and supremacy in enterprise on the sea as seafarers, not on the land as warriors. Even the martial races, the warrior castes like the Rajputs who migrated from north India and settled in Gujarat, gave up their weapons and war mania.

Before Independence, there were 396 native states in Gujarat – more than 50% of the total 656 native states in India. In the past, when the subjects of Kutch and Saurashtra revolted against tyranny or rebelled against injustice, they employed the traditional techniques of *tragu* (fasting), *dharanu* (squatting), *risamanu* (non-cooperation) and *baharvatu* (outlawry) against the state. In recent times, there were five strikes by textile workers and two *satyagrahas* by farmers against the British government on the problem of unjust taxes – at Kheda in 1917 and Bardoli in 1928.

It was here that Mahatma Gandhi experimented with satyagraha (non-violent non-cooperation) and later perfected it during his famous march to Dandi – the Dandi Kuch – in 1930. It is from Gujarat that a bania called Mahatma Gandhi bequeathed the gift of satyagraha to India and to the world. Today, it is universally acknowledged that satyagraha, not war, is the only way to peace and happiness. There were two landmark agitations by the students against their own government which lasted for months – the Mahagujarat in 1956 and the equally famous Navnirman movement in 1973.

**G**ujarat simultaneously worships both mammon and the muse. Both Laxmi (goddess of wealth) and Saraswati (goddess of learning) have showered their blessings on Gujarat. While being materially rich, it is certainly not intellectually poor. It is rich in the matters of the mind. Since medieval times the people of Gujarat and their language and literature have been derided: *Gurjaranam mukham bhrashtam* – the mouth of the people of Gujarat is corrupted – and *Shun shan paisa char* – their language is worth four paise. This is an unfair and distorted perception.

Gujarat has a history of learning comparable with any other state. In ancient times, Hsuan-Tsang and I-Tsing noted in their travelogues that the university at Valabhi, the then capital of Gujarat, was as great as those at Nalanda and Taxshila. In medieval times, at Patan, the then capital of Gujarat, Hemchandracharya's grammar *Siddhham* was placed on an elephant and taken out in a procession which was led by Gujarat's king, Siddharaj. Hemchandracharya and Vastupal were great scholars and their disciples were known for their learning. At Patan, Siddharaj founded 21

libraries, one of which had a collection of 15,000 books. He even had the manuscript of Agam scriptures written in gold ink. Gujarat claims the great Sanskrit poet Magh and the great astronomer Brahmagupta as its own.

In the history of medieval Gujarati literature, the *prabhatiyas* (metaphysical poems) of Narsinh Mehta, the *chhappas* (satirical poems) of Akho, the *akhyanas* (narrative poems) of Premanand and the *garabis* (lyrical poems) of Dayaram are rare achievements. In the history of modern Gujarati literature, Balashankar, Manishankar Bhatt, Sursinhji Gohil 'Kalapi', Balvantrao Thakore, Nanalal, Sundaram and Umashankar Joshi stand out as major poets; Govardhanram Tripathi and Pannalal Patel as major novelists and Manilal Dwivedi, Narmadashankar Mehta and Anandshankar Dhruva as major essayists. Gujarat has claimed two Gyanpith awards – Umashankar Joshi in 1968 and Pannalal Patel in 1986.

**F**or generations to come, Gujarati will be known throughout the world as the language of Mahatma Gandhi. The fact is that Gujarati men of letters have kept a low profile, practising their art in the midst of a very practical people. In 1959, at the Nikhil Bharat Bang Sahitya Sammelan in Ahmedabad, Devesh Das, listening to Gujarati poets at the poetry reading session, said to Umashankar Joshi, 'Gujarati poets exercise great restraint.' Umashankar Joshi answered, 'It may be so. We write poetry in the midst of people who are pragmatic. We would seem absurd if we let our emotions loose.'

A few facts and figures regarding education in Gujarat speak for themselves. There are six universities and 42,000 educational institutions from the primary to the higher secondary levels in which 9,800,000 stu-

dents pursue their studies. Currently, Ahmedabad has half a dozen educational institutions of national and international repute: IIM, PRL, NID, ATIRA, CEPT AND GLI. Literacy levels stand at 60%, which is higher than the national average and makes Gujarat the fourth most literate state in India.

**G**ujarat is not a large state. Its total area is 1,96,000 sq km which is 6% of the total area of India. It has a population of 44,400,000, which is 5% of India's population. Its land is fertile. It is famous as 'Urvisar Gujarat' – the essence of the earth. 60% of the population is engaged in agriculture and 18% in industry. A part of its prosperity comes from the fertility of its land, though a larger part comes from the sea. Gujarat is vertically split, as the poet Nanalal says, 'into two wings – one blue and one green.' The western wing is blue and the eastern one is green with the sea on the west and the forests on the east. There is, therefore, prosperity in the west and poverty in the east.

Of the total population of Gujarat, 7% (3.5 million) are harijans, 15% (6.5 million) are Girijans and adivasis. Thus, they make 22% (10 million) of the total population of Gujarat. In other words, one in five persons in Gujarat is either a harijan, a girijan or an adivasi. Of the total population of Gujarat, 30% live below the poverty line against 40% of the total population in India.

In the 21st century, illiteracy will pose the greatest challenge to Gujarat. The large number of illiterates are a matter of shame and concern. Illiteracy is a man-made evil. It is the root of all other evils, namely poverty and disease. When Gujarat eliminates these three evils, it will be worthy of itself, it will be true to its name 'Garavi Gujarat' – the glory that is Gurjardesh.

# Evolving architectural traditions

R.J. VASAVADA

ARCHITECTURE may be seen as a prism, the three sides of which are culture, patronage and building arts. Culture reflects the way of life at a specified time – incorporating taste, aspirations and social richness as reflected through the artistic and creative expressions of various arts. The patronage of these impulses is an indicator of the need for, and awareness of, collective identity. The building arts are indicative of the level of technological skills and craftsmanship at a specific time.

Prosperous communities took upon themselves the responsibility to uphold the traditional heritage and nurture artistic expressions. Settlements embody the cultural traits of the society that gave expression to them. Our earlier settlements reflect a tasteful, collective expression of will in which community identity and existence shaped social thinking and responsibility. More than material well-being, the welfare of the community was paramount.

Throughout history, western India was subjected to constant pressures. As a result, the region experienced a cultural vibrancy, which makes it interesting for those interested in cultural history. The geographical boundary in which Gujarat is

encapsulated covers a large part of western India and its regional history goes back to ancient times. Archaeological relics are useful since they trace fragments of built-environment providing insights into architectural heritage, which is an important indicator of the cultural status of its people.

Historically, the region was culturally diverse. Peninsular Saurashtra, also known as Kathiawar, was controlled by five different princely states, each culturally different, including their dialects. The early history of this region is marked by raids from external forces and domination by rulers from north India, at times capturing and appointing their own agents to administer it and control revenues. The well-being of people and the prosperity of various towns and settlements depended upon good governance. Such favourable conditions were observed only in distinct periods and it would be interesting to review which of these various phases in the history of this region were productive and left behind an important cultural heritage.

It terms of architectural developments in the Indo-Aryan phase, western India was one of the richest regions. Subsequently, the early 11th

and late 13th centuries too represented an important phase in the region's architectural development. The pre-11th century period was marked by raids from Afghans and the resultant strife. Solanki rule provided the much needed stability and Anhilwada-Patan became an important cultural centre of the region.

Once the Delhi Sultans took over there was relative peace and prosperity. This resulted in the establishment of settled communities practicing trade and commerce. The wealth generated owed substantially to its geographical position on the coast, which serviced major international trading routes. The affluent trading communities diverted part of their resources to create a form of distinct religious architecture, a rich tradition which still exists.

Unfortunately, many of these early creations were destroyed in the succeeding centuries of Muslim rule. From the 15th century this region was once again dominated by Muslim rule following the Moghul takeover, interspersed by brief and sporadic spells of Maratha rule till the British finally took over the administration. Though the princely states in Saurashtra and other parts of Gujarat continued to exist, it was under British suzerainty.

Architecturally, examples of the early phases survive in the coastal areas of Saurashtra and constitute an important heritage. The Muslim domination can be traced from the 15th century and finally there is the immediate history which has shaped our present. The period post the Moghuls is once again marked by a fragmentation and dilution of architectural activity. Overall, the two significant phases have been the Solanki and the later Muslim rule, the latter resulting in the establishment of Ahmedabad.

The rule of the Solanki dynasty from the 10th to the 13th century is

best exemplified by the temples at Sunak, Delmal, Kasara, Kanoda (all 10th century Gujarat); Mount Abu and Kiradu (11th century Rajasthan); Rudra Maal, Vadnagar, Siddhapur, Patan, as also Somnath (destroyed several times in the 12th century); and the Jaina Temples at Girnar (13th century). This phase provides rich examples of civic architecture connected with buildings for public use and other monumental functions. City gates, victory towers, as also buildings connected with utilitarian functions became exemplars of exquisite building craft. Step-wells and *kunds* on trade routes and temple precincts speak volumes of the architectural creativity which continued in later centuries of Muslim rule. The city gates at Jhinjhuwada and Dabhoi (12th century), Ranki-vav at Patan (11th century) are among the most important markers of this period.

The Solanki period saw the evolution of religious architecture with its reflective aspects finding a subordinated expression in the domestic

sphere. The fine temple building traditions in stone structure found their corollary in the exquisitely ornate houses with their timber facades. The resources of the community helped establish a strong and durable religious tradition. This, in turn, led to the development of a flexible, affordable yet exquisite art and decoration in the abode of people and family which stimulated the same feelings as a temple. These traditions survived the Muslim domination of the region and over time constituted an enduring tradition in western India.

The Muslim rule came to terms with the extant communities and their establishments. It also recognized the quality of the prevailing building crafts and the skills of the communities of craftsmen. The 'mahajan' and the craftsmen were both accommodated and made partners by the Muslim rulers in establishing their state and institutions. This mutually acceptable merger, in turn, laid the basis for a strong foundation of a distinct architectural expression in western India, with Ahmedabad and Gujarat as its main centre and region.

This expression was a result of a synthesis reflective of the mutual desire to appreciate and adapt from

Plate 1: 11th century Shiva temple at Sander near Mehsana in north Gujarat. Example of Solanki period architecture.

both cultures. The building expression displayed the content of one and the form of another, the ideas and needs of one and the craft of another, the patronage of the rulers and the skills and abilities of the local people. It was a partnership in peaceful and prosperous coexistence. This became possible as the local merchant population was at peace and their trading interests were not harmed by the rulers. The rulers in turn were also happy as there was prosperity in the region, crucial for the stability of the region-state. No wonder this phase became significant for architectural development.

**M**uslim architecture under the Ahmedshah Sultans could be categorized in three phases during its two and a half century rule—14th century, early 15th century and the late 15th century onwards respectively. These phases produced some of the most notable structures under the patronage of Sultans, who displayed a remarkable taste for the built environment, as also to establish their might as rulers. Gujarat also provided a favourable climate with its unrivalled crafts resources and building traditions. The Sultans made the best use of these resources in building institutions, both for personal use as well as for the city, especially in Ahmedabad which they established as their capital.

The craft communities, which hitherto were primarily involved in building temples for the local Jaina community, were easily diverted by the rulers to their own works. While adhering to their own codes and canons of architecture based on their traditions, the artisans had to modify these codes to suit the needs of their new masters, who were culturally poles apart. However, the craftsmen did not find it difficult to apply their skills, which assumed the dimensions of patterns, carving and sculptural relief in

place of sculptural iconography of temple architecture with definite symbolic significance.

In fact, since the patterns employed and the decorative filigree was left to the imagination of the craftsmen, their skills in moulding stone could be abundantly displayed. It reached an unsurpassed level of exuberance in the new synthesis under the Sultanate architecture of Gujarat. It was to become one of the most important architectural idiom in the provinces of India. The important centres of this architectural development were Patan, Broach, Cambay and Dholka in the 14th century; Ahmedabad, Sarkhej and Dholka in the first half of the 15th century; and Ahmedabad, Mehmabad, Batwa and Champaner, all in the latter half of the 15th century. The third phase of development under Mahmed Beghara (1459-1511) was the richest period in the evolution of the building arts. Ahmedabad and later Champaner became the centres of architectural developments with a synthesis of the

local and imported traditions. The existing fragments testify to the richness and glory of the achievements in the building arts of that period.

The period of Muslim rule after the 15th century was once again marked by stability with the architectural expression borrowing from the local idioms. There was increased building activity, both religious for Muslims as also buildings for public utilities. In this new architecture the Muslims improvised and drew upon local and indigenous traditions. For example, the mosque was enlarged and included the *mandapa* form as a hall in front of the *mihrab*, with an octagonal shaped plan within a square which was structurally best suited to span the roof with a dome. A local temple would have had a pyramidal roof on top of such an octagonal plan. The *vav* was elaborated into a subterranean resort around a source of water to ward off the summer heat, as in the case of the step-well near Mehmabad.

However, in the later period of the rule of the Moghuls and their

Plate 2: Jami Masjid, Champaner and Sayeed Usman's tomb (Plate 3, on following page). Ahmedabad. Early 16th century examples of the building style of the Ahmedshahi Sultans reflecting fusion of Muslim conception and Hindu execution.

regional administrators, royal patronage considerably diminished. But because of the ongoing support of the merchants and nobility, the building traditions survived. Around the 16th century there was an increased influx of the foreign merchant class which started to make its presence felt. Gujarat was frequented by the English and Portuguese traders and in order to establish their trading interest, both with local merchants as also the Moghul state, they built factories, churches, convents, cathedrals as also fortresses for their settlements and tombs as memorials to their dignitaries. Like earlier invaders, they brought with them their own cultural ideas of the built environment, involved local craftsmen, borrowed local materials and building practices and constructed their own settlements and buildings. Some prominent examples are the towns of Diu and Daman with their lofty and characteristically Indo-Portuguese buildings—an architecture expressive of another synthesis. These building practices, particularly under

more permanent British influences, brought about drastic changes in local traditions and building practices.

The building activities under British patronage were controlled by British engineers who worked as they would have in their own country. Their building activity centred around administrative offices and bungalows or garden house residences for both the British and Indian nobility. Though local materials were promoted for building, the English engineers brought in their brick and stone construction and trained the local *mistrys* to adopt these practices. In lieu of their traditional craft and stucco, brick and rubble work became the new favoured materials and methods which changed the course of building practices in many parts of India.

**T**he new monumental buildings influenced the regional princes and rulers who wholeheartedly accepted the new 'progressive', westernized building practices expressing a strange mixture of oriental and occidental forms. They were stylized and preferential but unlike the earlier building traditions completely lacking an integral character. Important examples of this phase can be seen in Baroda, Ahmedabad, Rajkot, Bhuj, Jamnagar, Junagadh and Morvi. New towns were also planned – Uplata, Goudal, Jamnagar—restructuring the existing townships under the advice of British and European planners and architects in the 19th century. Some of the most remarkable structures of this period can be seen in Baroda (the palace and Baroda college), in Ahmedabad (the Town Hall), and the palaces in Bhuj, Morvi and Wankaner. In all princely towns scores of build-

Plate 3: Sayeed Usman's tomb, Ahmedabad.

tions and libraries) were built during this period which stand testimony to the changed attitudes towards the building arts. The craftsmen once again exhibited their innate ability to adapt to the new situation.

The post-independence era witnessed the involvement of European masters to infuse a new spirit in our traditional but changing society. In the later years of the colonial period, Englishmen working in India had neglected local traditions and were unable to revitalize the evolutionary trend. Though some English architects did perceive 'the germs of a movement... which suggest that a trend in the direction of reviving the styles of architecture indigenous to India is in contemplation, and it is hoped that some genius will arise who will combine the beauty and the spirit of the old national art with

the methods and ideas of the new age.<sup>1</sup>

But this was not the thinking of our leadership at the time of Independence. They thought it was necessary to look West to plan an Indian city and its 'democratic' institutions – to inspire the India of the future. They clearly did not believe in what the English architects, after years of experience in India, had come to realise. The new leadership was keen to incorporate the ideas of a modern movement, which were not even acceptable to progressive westerners. The new expression – an alien one – pushed in new materials which were industrial, as also an environment which did not induce any cohesion. However, this was to become the 'universal' vision of the built environment and architecture of the future India.

Gujarat, ever progressive in absorbing new currents, had an elite eager to invite these masters so as to give a new expression to the emerging institutions. By then city authorities and the merchant associations had become powerful patrons and the new cultural institutions promoted by them were looking for new, modern expressions. The advent of modern architecture in Gujarat in the '50s was contemporaneous to that of Chandigarh. Ahmedabad already had a major share of Le Corbusier's

projects worldwide for private houses and institutions.

Modern architecture – individualistic, universal and carrying the designers' imprint – found many patrons. Its aloofness was seen more as a virtue rather than an aberration from the indigenous. As representative of the architecture of another culture, while these buildings displayed qualities of their designers, the format offered was primarily functional. This impacted architectural practice, particularly of the younger generation. Indian architects developed western leanings and associations with the modern movement. The architectural profession soon got disoriented as none of the buildings demonstrated either a seriousness, promise of new interpretations and attitudes, or an appreciation of the real needs of people. New industrial materials were introduced but without the back-up technology that went with them. Local crafts were sidelined. Building activities became labour (as against craft) oriented and the processes became increasingly alienated. Architecture as an art was steadily replaced by building as trade.

The built environment of an era reflects the collective expression of the community and in that sense is embodied in its settlements. The earlier settlements were representative of the community's ideals and way of life. The characteristic urban settlements of the 17th, 18th and 19th centuries stand testimony to this attitude in many a town and city of Gujarat. For this reason the wooden facades of houses are a priceless heritage of Gujarati architecture of the last 300 years. Similarly, the symbolic religious architecture from the same era too stands testimony as a source of inspiration

Plate 6: House owned by the Sahaj family, Khadiward, Ahmedabad. 18th century. Note the use of timber for decoration and the embeddedness of the house to the settlement permitting the use of street space as an outdoor community space.

for the community's preferences for the architecture of settlements.

All this was appreciated as long as the traditions were alive. But with the grip of the economic and administrative control slipping into British hands, the social situation was influenced by western attitudes and thinking. The beginning of the 20th century saw the 'development' of almost all towns and cities in Gujarat. It provided a release for the moneyed class to opt for westernized living in bungalows outside the old towns. It resulted in a break from traditional community bound living to more mixed settlements, reflective of the social and economic standing of the residents. This led to the emergence of a new urban middle class with segregated dwellings in a suburban environment, resulting for the first time in a departure from the compact, homogenous living of the pre-British traditions.

With westernization taking firm roots, new institutions were gradually introduced to supplement civic life. The new areas added to the towns virtually became western adjuncts dotted with parks, gardens and enclaves of educational buildings and public

1. Percy Brown, *Indian Architecture* (Islamic period), D.B. Taraporewala Publication, 1956. p. 127.

amenities. The architecture patronized by the British was obviously a mix of ideas from the West using local masonry and craft-help under British designers and British trained mistrys, what subsequently came to be known as the Public Works Department architecture.

Studying our heritage helps contextualise the present. The contemporary scenario has its roots in the socio-political developments of the previous half century. The

party which led the struggle for independence also assumed power hoping to govern the country with an utopian dream of bringing together a diverse and heterogeneous populace with a long tradition of provincial rule. The old social system was ingrained into people, who identified themselves with a feudal lord or a king and the system worked perfectly in tune with this. Though the economic means were controlled by the nobility, by and large there was a responsible atti-

Plate 8: Villa Sarabhai, Ahmedabad, 1950. Architect: Le Corbusier. Example of suburban house. A complete departure from early community living.

tude towards the welfare of common people.

The new party, comprising of freedomfighters whose main aim was to oppose the colonial government, suddenly found itself at the helm of a country whose size was at least 20 times larger than the states in which they lived. The ensuing contradictions are well known. But the most important reason for the deterioration of the built environment in urban areas was the exploitation of land for vested interests connected with the power centres. This was a fall-out of the power that political leaders acquired in the merger of states. Their biggest gain was the ability to take over land by displacing farmers around the urban growth centres.

Land, a critical lever in power struggles, has come under the stranglehold of politicians. Subsequently, building has become an 'industry', a saleable commodity for profit. This is the real scenario of our built environment all over the country and Gujarat is no exception. Land and buildings provide an easy escape route for tax evasion and appropriation of unaccounted wealth, a part of which can also be diverted to the politicians in conjunction with those running the 'industry' in a mutually supportive existence.

It is, therefore, important to distinguish between mere buildings and works of architecture. Every building is not a work of architecture and everyone who builds is not an architect. In the past, architectural design and construction, mind and action, worked concurrently. Often the owner, together with the designer, was directly involved with the construction team. This tradition no longer exists. Probably the split of mind and labour, thought and action, is the result of the social division of labour, just as the need to build and trade buildings as commodities is a consequence of the new political culture.

**T**his separation of means and ownership has resulted in an impersonal environment, a loss of standards, and above all, a loss of cultural exchange which could support healthy and cohesive living. No wonder, when it comes to describing contemporary excellence in the field of architecture, or suggest towns and cities which are reflective of a continuity of historic precedents, we are at a complete loss. What marks today's built environment is a lack of purpose and character.

# My mother tongue

ACHYUT YAGNIK

I share my mother tongue, Gujarati, with the fathers of two nations, Mahatma Gandhi of India and Mohammed Ali Jinnah of Pakistan. With Dādabhai Naoroji, the grand old man of Indian politics and founder editor of *Rastagoftar* a Gujarati weekly started in 1851, I share not only Gujarati as a mother tongue but also the heritage of Gujarati journalism. And with Sardar Patel, I share a common dialect, *charotari*, which is spoken in central Gujarat and considered rustic by the Gujarati *literati*.

While Gandhiji wrote his major works like *Hind Swaraj* and *My Experiments with Truth* in Gujarati, Jinnah hardly ever communicated publicly in his mother tongue. It was only in 1917, and for the first and last time, that he addressed a public meeting at Godhra in Gujarati, at Gandhiji's insistence!

During the last phase of British rule, in the middle of this century, one associated Gujarati with great political personae. But during the early phase of Company rule, in the latter half of the 17th century, the Gujarati language was primarily associated

with the 'Bania' by the East India Company; even the script was referred to as 'Banian'. It was a Bania who took the first step towards printing Gujarati. In a despatch sent to London on 12 January 1676, the president of the Surat Factory wrote:

'The Printing designe doth not yett meet with the successe as expected by Bimgee Parrack, who hath taken great paines and been at noe meane charges in contriving ways to cast the Banian characters after our English manner; but this printer being wholly ignorant therein, and not knowing anything more than his own trade, is noe wayes usefull to this designe; ... Wee have seen some papers printed in the Banian character by the persons employed by Bimgee which look very well and legible and shews the work is feasible: but the charge and teadiousness of these people for want of better experience doth much discourage...'

In 1671, Bhimjee Parekh, a Bania merchant and broker of Surat Factory requested the East India Company in London to send a printer to

Bombay and was ready to pay him 50 sterling a year for three years. This printer reached Bombay in the year 1674; the first 'Bania' characters were cast and Gujarati printing made its beginnings the following year. Unfortunately, no specimen of Bhimjee Parekh's 'printing' has been traceable for the last 200 years, making it difficult to say anything definitive about the 'characters' – whether they were in the Devnagari or 'Bania' script.

The earliest reference to 'Gurjari' or Gujarati script was made in the *Vimalprabandh*, a 16th century Jain text and the earliest known manuscript in the Gujarati script is *Adiparva*, written in 1591-92. During the 17th and 18th centuries, two different modes of writing Gujarati were prevalent. One was the 'Shastri' script, adopted mostly by Brahmins to write about religious matters and the other, the 'Mahajan' or 'Bania' script, commonly used by the mercantile community for accounts and to communicate commercial matters. Without going into the finer details one can say that the Gujarati script is a regional variation of the Nagari script, without the headline.

Since there is uncertainty about the characters cast by Bhimjee Parekh's printer, the advertisement which appeared in the English periodical *Bombay Courier* on 22 July 1797, may be considered as the earliest specimen of Gujarati printing. This advertisement, about the rates of certain merchandise, was issued by the Secretary to the Governor of Bombay. All the characters, including numerals, were in what is today known as the Gujarati script. Fifteen years later, in 1812, a regular Gujarati printing press was started in Bombay by a Parsi entrepreneur, Fardoonji Marzban. He published the first Gujarati book in 1815 and the first Gujarati newspaper,

*Mumbai Samachar* in 1822 which is the oldest surviving newspaper in India.

From its very first issue, published on 1 July 1822, *Mumbai Samachar*'s language policy favoured a composite Gujarati language – a grand synthesis of Sanskrit, Prakrit, Persian, Arabic and English. As the editorial suggests:

'Thirdly, it is known to all that in India the first language that was in common use was Sanskrit and that from it branched out several dialects, Gujarati being one of them. In this Gujarati language, during the predominance of the Moghul power in India, a great many Persian and Arabic words were naturally added. Similarly, now that the British are acknowledged rulers of the country, the language in question has been enriched with an admixture of English words. These Persian, Arabic and English words which are now generally used by the Parsis in common parlance, are not so well understood by the Hindus. Whereas the Sanskrit and Prakrit element which prevails in the Gujarati used by the Hindus is all but unintelligible to the Parsis. In Gujarati there is a remarkable absence of scientific words, and if a few such words do exist in the language, on account of their Sanskrit origin, they are incomprehensible to most people. We propose, consequently, to use such Gujarati in our columns as may be equally intelligible to both Parsis and Hindus. Of course, we could have, if we had chosen, either used pure unmixt Gujarati, or Gujarati having an admixture of Persian, Arabic and English words. But in either case, as we think we have sufficiently indicated above, at least one section of the Gujarati-speaking peo-

ple would have found it rather difficult to understand our language clearly.'

This historical editorial, written before the advent of modern education in western India, gives an interesting outline of the history of the Gujarati language and also a glimpse of the internal tension felt by a speech community regarding the future direction of the language. The tension between 'Hindu' Gujarati and 'Parsi' Gujarati continued for the next 100 years. Till as late as 1930, the debates about 'corrupt' Parsi Gujarati versus 'Sanskritised' Gujarati were regular topics of discussion in Gujarati periodicals.

While this century-long debate and discussion continued in literary and journalistic circles, the ever expanding modern education with Gujarati textbooks put its stamp on 'standard' Gujarati. Obviously, the early educationists were the upper caste Hindus in urban centres like Surat, Bharuch and Ahmedabad. As a result, what is considered 'standard' Gujarati today is in a way a continuity of the language tradition of the urban Brahmin and Bania communities.

An important step towards the standardisation of the Gujarati language was proposed by Mahatma Gandhi himself when, in 1929, the Gujarat Vidyapith published a monumental Gujarati dictionary or *Jodanikosh*. Many controversies about the spelling of Gujarati words were put to rest as Gandhiji gave his blessing to the venture. In 1929 he wrote in *Navjivan* that 'from now onwards no one has the right to spell according to personal liking'. By 1940, the Bombay government too fully endorsed the spelling system of Gujarat Vidyapith with a notification to adopt the same spellings in textbooks. Sixty years after the first edition of this dictionary, a campaign to simplify Gujarati spell-

ing has begun. Today, a state-level platform, with the support of many distinguished educationists, linguists and writers, has advocated a modified and simplified system.

The process of standardisation, which started in textbooks and schools in the 1820s, was followed by the process of complete legitimisation by the middle of the 20th century. The Indian Constitution accorded the status of a 'scheduled language' to Gujarati and by 1960 after the reorganisation of Bombay, Gujarat became a separate state on the basis of its language.

**B**oth Gujarat and Maharashtra should have been bifurcated in 1956 when the reorganisation of states on linguistic lines was initiated. By not bifurcating Bombay state, the Congress leadership invited two parallel mass movements, the Sanyukta Maharashtra movement in the Marathi speaking areas and the Mahagujarat movement in Gujarati speaking areas, which continued for four long years.

The movement was named Mahagujarat to suggest that three areas – Gujarat proper, Saurashtra and Kutch – would together form the proposed new state of Gujarat. As far as Saurashtra was concerned, Gujarati was the common language spoken by more than 90% of the population. But the situation in the Kutch region was different, with 52% of the population speaking Gujarati and 45% Kutchi, which is closer to Sindhi. As Sind province went to Pakistan after Partition, no controversy was raised and as a result Gujarat proper with Saurashtra and Kutch were united under the new Gujarat state.

Before the bifurcation of Bombay, for almost 111 years, a bitter controversy about the adivasi district of Dang and Dangi speech continued in political and cultural circles. Sir George Grierson who headed the Lin-

guistic Survey of India for 29 years considered Dangi as a dialect of Khandeshi-Marathi on the basis of its grammar. The Census of 1921, following Grierson's classification, also considered Dangi to be a dialect of Khandeshi-Marathi. After Independence, the Bombay government, following a visit to Dang by Chief Minister Kher and Home Minister Morarji Desai in early 1949, passed an order declaring Marathi as the medium of instruction in the schools of Dang. This government order met with wide ranging protest from the literary cultural associations of Gujarat and Dang became a subject of politico-cultural controversy. Ultimately, Dang was merged with Gujarat state following a political deal.

**T**he controversy around Dangi speech is significant for more than one reason. In reality, four different adivasi groups – Bhil, Kukana, Warli and Gamit – each with their separate speech traditions, have lived in the forests of Dang for centuries. By the early 19th century, the Dang forest was taken on lease by the Britishers and gradually a creole, called 'Dangi' by British administrators, developed around the main roadlinks. Thus, Dangi was superimposed on the adivasi communities of Dang by the colonial masters for economic and political reasons; later, Gujarati was superimposed for political reasons.

At the turn of the century, modern education was introduced in adivasi areas of Gujarat with Gujarati language as the medium of instruction, first in the princely state of Baroda and later in the eastern tribal belt. Today, compared to neighbouring Rajasthan and Madhya Pradesh, the adivasi communities of Gujarat are more literate due to the early introduction of education. But compared to the rest of Gujarat, literacy levels

of the adivasi communities lag far behind.

According to the 1991 Census, literacy among the adivasis was 29.67% compared to 51.17% for Gujarat and female literacy among adivasis was less than half of the total female literacy rate – 19.55% compared to 40.62%. While there are many reasons for the sorry state of education, of the many handicaps experienced by adivasi students the primary one was the imposition of Gujarati as the medium of instruction in the early stages. This, despite the fact that the Constitution was amended in 1956 (the Seventh Amendment) to include Article 350A which clearly stated that it was the statutory responsibility of 'every state and every local authority to provide adequate facilities for instruction in the mother tongue at the primary stage of education to children belonging to linguistic minority groups.'

**L**ike in most of India, adivasi mother tongues were seldom considered the natural medium of instruction in the early standards. This was true even for the Gandhians who started *ashramshalas* for adivasi boys and girls in the 1920s. The first generation of adivasi teachers tried to evolve an appropriate script for adivasi dialects like 'Chaudhary', but they were never encouraged. Even after Independence, no impetus was given to adivasi dialects like Bhili by either the Bombay or the Gujarat governments. Only last year, textbooks in Bhili and Dangi were prepared and a pilot project initiated, though many influential sections of educationists and literati opposed the move.

It is likely that many of the adivasis of Gujarat will increasingly identify with the Gujarati language. Looking at census data on language from 1961 to 1981, it is apparent that

the adivasis of Gujarat have shown little resistance to Gujarati, the dominant language. By 1981, more than 75% of the adivasi population claimed Gujarati as their mother tongue; the ancestral language identity had merged with the dominant language. This is of some significance as adivasis form 15% of Gujarat's population.

**O**n thinking about the future of the Gujarati language, a number of question marks appear on the horizon. The trajectory of the development of the language seem to be moving in different directions. Under the impact of globalisation the upper caste elite of Gujarat, who, ironically, were the moving force behind the standardisation and legitimisation of the language, have shown a greater preference for English and English medium schools. This is equally true for cities like Ahmedabad and Surat and for district and middle level towns.

A hundred years ago, a similar process took place among the Parsis, another community which played an important role in furthering the language. Parsi parents showed a marked preference for English medium schools which they equated with modernisation. By the middle of the century, Gujarati was essentially restricted to inter-generational communication among Parsi families of metropolitan cities.

Now, a gradual distancing from the Gujarati language is underway among the Hindu upper caste elite of big cities. Most of these families have gone through professional and technical education, and the language they speak is a mixture of 'standard' Gujarati with an increasing proportion of English. The situation of upper caste, middle class families in the cities of Gujarat is more complicated. Most of them are neither confident of writing or speaking English, nor are

they able to write 'standard' Gujarati. What they speak is a new city dialect where every sentence is a *khichdi* of both languages.

While upper caste Gujarati families with more than two generations of education have shown a preference for English, families with first or second generation education, mainly from 'backward' caste communities, are moving away from their dialects, showing great reverence for 'standard' Gujarati. For them, sanskritised Gujarati is a marker of upward mobility though often they too prefer English medium schools under the influence of urban, upper caste Gujaratis. Oblivious of the ongoing upsurge of the 'backward' communities, the university and college departments of Gujarati language and literature which are dominated by upper caste Hindus, generally function in ivory towers with antennae directly receiving signals either from the classical world or from the post modernist western world.

**O**utside Gujarat, the largest population of Gujarati speakers in India is in Mumbai, where a sizeable 17% of the population speaks the language as their mother tongue. The roots of this population go back to the same Bhimjee Parekh. He was one of the first Gujaratis to be granted permission from the East India Company for Banias to settle in Bombay to escape forced conversions to Islam in Surat. It was here that the development of the Gujarati press and modern education began and even today all important Gujarati dailies have Mumbai editions. But in the city which once provided fertile ground for the development of the language, Gujarati medium schools are closing down. The trend of using English words in written Gujarati began in the newspapers published from Bombay, a trend

which has permeated all of Gujarati journalism.

**B**esides Bombay, an important centre of Gujarati language in the subcontinent is Karachi. Both were important port cities of the Bombay Presidency and the Gujaratis played an important role in creating their eminent status as commercial capitals. Even after Partition, 7% of Karachi's population is Gujarati speaking, serviced by a Gujarati daily and almost a dozen periodicals. An excerpt from an editorial in the Gujarati periodical *Memon News* of 16 August 1994 reveals the Muslim Memon community's deep feelings for their mother tongue:

'Every community is characterised by its language and dress. If that community has a script, its lustre increases. At the national level, when we discuss language and dress in seminars and meetings, we emphasise the importance of Urdu as the national language and salwar-kameez as our dress. Thus, at the international level, when we want to present ourselves, our language and dress signify our nationality. We understand the importance of this and try to implement it in our life.

Similarly, the regional language also has its own distinct form. Every community nurtures this form and tries to enrich its own language. Language is the cradle of cultural norms and values. One can take the "risk" of preserving one's language, but one cannot commit the "crime" of forgetting it.

As a mercantile community since centuries, we have been nurtured on the bosom of our language and it has never led us astray. In our accounts, education, business dealings and reading-writing, we have been using Gujarati. In every walk

of life we have embraced the Gujarati language.

Despite this, since the last two decades, it seems that we are gradually distancing ourselves from our language. By turning away from Gujarati, we have not gained anything in the cultural sphere. On the contrary, we find ourselves in adverse circumstances. The distance between old and new generations has increased. We see pitiable situations where the father does not understand the son's language and the son understands neither the father's language nor script.'

This yearning for the mother tongue is also reflected in the ever increasing Gujarati speech community in the western world, mainly in the UK and the USA, who would like the next generation to retain its Gujarati identity by learning the language. In the UK, among the population of South-Asian origin, the Gujarati speech community of approximately half-a-million is the biggest bloc followed by the Punjabi speech community. A majority of this Gujarati speaking population reached the UK via the East-Africa route and their speech still retains the flavour of the language spoken in Gujarat during the turn of century when they left for Africa.

**I**n the USA, a majority of the Gujarati speaking families are upper caste Hindus who migrated after the fifties and still maintain close links with their relatives in Gujarat. At home they speak Gujarati studded with English words and would like the younger generation to learn Gujarati. The younger generation is uninterested but their parents, many a time for matrimonial reasons, try to arrange Gujarati classes through their cultural associations or private tuition through senior citizens.

An interesting development took place in 1985 when the US

Department of Education published a list of 169 languages which the government considered to be critical, in the sense that their knowledge would promote scientific research and security – national and economic. 21 Indian languages figured in this list including Gujarati. The US Defence Department funds the study of these languages. Significantly, this list includes languages which do not feature in India's own scheduled list of languages like Maithili, Santhali, Kumauni.

**T**hese are some of the different directions that Gujarati is taking. On the one hand, like the Parsis before them, the upper caste elite is moving away from the language, while their cousins in the West long for their children to be fluent in their mother tongue. So do the Memons, cut off from their roots by Partition. At the same time others sections of society, like the adivasis, dalit and OBC communities are embracing 'standard' Gujarati. While adivasis are abandoning their own language traditions, the dalits and OBCs are gradually moving away from their local dialect base to 'textbook' Gujarati. In other words, a historical transition from the oral to the written tradition has been underway in almost all 'backward' communities. Even among the upper and middle castes, area specific dialects like Charotari, Surati, Sorathi or Halari are gradually being replaced by the urbane Gujarati of the mass media.

As more communities, till now 'voiceless', enter the written order, Gujarati language and literature will witness new thrusts viz., the emergence of dalit and women's literature in the last two decades. These new voices, these new signatures, have brought with them a long-suppressed creativity and will be the fountainhead of the revitalisation of the Gujarati language in the 21st century.

# At the turn of the century

*Looking at the Dalit-Adivasi struggle in a historical context, **Rameshchandra Parmar** and **Ashok Chaudhari** articulate the challenges that face the 'other' Gujarat on the threshold of the 21st century. Rameshchandra Parmar is one of the founders of the Dalit Panther movement in Gujarat and a member of the Presidium of the National Dalit Panthers. He has written a number of books on Dalit issues. Ashok Chaudhari is Vice-President of Vedchhi Pardesh Sewa Samiti, a Gandhian voluntary organisation working among adivasis for the last 45 years. He is also one of the founders of the Adivasi Ekta Parishad and has been associated with the adivasi movement for the last 25 years.*

**AC:** Rameshbhai, what do you think are the similarities and differences between the issues which face two important communities like the dalits and adivasis, particularly in the context of the 21st century?

**RP:** I would begin with the current thinking about dalit, adivasi and other backward communities. Unfortunately, all three communities have no 'history', or some of the roots of their history have either withered away or been erased. Therefore, the intellectuals of these communities are trying to re-establish or excavate these missing roots.

The scheduled castes of today are actually the tribes of the past. Take the example of the Vaghri community, who today are listed among other backward

communities. But their present religious practices revolve around their *kuldevis*. They have nothing to do with Brahma, Vishnu, Mahesh. Thus, there are two separate traditions – one, the Brahminic and the other which is practised by the labouring communities. In the long span of history, the traditions of the labouring communities have disappeared or been marginalised.

Many scholars believe, and Babasaheb Ambedkar is foremost among them, that the traditions of the present-day dalits can be traced back to the Harappan culture. After the arrival of the Aryans, the local communities were either defeated or displaced and as a result they were pushed into the forests and mountains where they continued their traditions. But they did not accept the hegemony of the Aryan invaders and offered resistance when attacked.

After a long spell of time, some of them moved closer to the Aryan settlements. They were never given the right to settle inside the village so they lived on the outskirts. In Gujarati, we have a word, *gramlok*, or village people, and these communities on the outskirts were never considered *gramlok*. In other words, those who settled at the outskirts of the village are today's scheduled castes and those who continued to live in the forests and mountains are today's Scheduled Tribes.

All throughout they challenged Brahminic supremacy, though after the spread of the *bhakti* movement we find dalit saints along with other saints chal-

lenging Vedic religion, Brahminic rituals and the caste system.

**AC:** The bhakti movement also made deep inroads in adivasi societies. Of course, some of them even accepted categories like *paap* and *punya* and worshipped gods and goddesses of the Hindu pantheon. But they gave these concepts their own interpretation. Ghulam Maharaj was one such saint in the present century.

All said, adivasis are essentially worshippers of nature. They are *prakruti poojak* and *prakruti moolak*. For them, the elements which are the foundations of life or can be considered life giving, are objects of worship. Other than these, there is no *paramatma*. In Gujarat, we worship the Mother Goddess Kansari and as the word suggests, she is the grain goddess.

Adivasis also celebrate life and consider life itself as sacred. Even today, among the adivasis of Dang, a pregnant woman's husband will not cut a tree or kill an animal in the belief that when one life is blossoming another should not be taken. As a result, every time adivasis encounter organised religion in any form, there is a clash between this basic adivasi outlook on life and the tenets of organised religion, whether it is Brahminic Hinduism or Christianity. It is well-known that since the latter part of the last century, missionaries were active in adivasi areas but somehow these ideological differences were never resolved and continue till today.

I think all organised religions are authoritarian and hegemonistic. Even paramatma is authoritarian. Kings were also considered manifestations of paramatma and their authority was accepted. This contradicts the basic spirit of freedom innate in every adivasi.

Paradoxically, this very spirit of freedom has prevented adivasis from getting organised and offering a united opposition to authoritarianism. The communities who subjugated us, developed not only *shastra* (weapons) but also *shastra* (codified knowledge) to further their expansion. And they have continued in the same spirit today, developing weapons like atom and hydrogen bombs. But we have neither acquisitive nor expansionist tendencies, so we have not gone beyond bows and arrows. Not only is the adivasi way of life different, their approach to life is different as well.

**RP:** I think that the very concept of mainstream Hinduism is recent in Indian history. Even 75 years back there was no concept of a monolithic Hindu society. It was a caste society. In the context of Gujarat, one would refer to someone as a Patel or a Brahmin. Even the idea of defending one's own religion came after the British and the spread of Christian missionary activity.

But coming back to these communities who stayed outside the settled villages, they retained many of their tribal practices, gods and goddesses. But over a period of time a number of practices belonging to the settled villages were also incorporated.

**AC:** I would like to add that most adivasi rituals are performed by women and men play a very secondary role.

**RP:** That is because adivasi societies were matriarchal and we know that the problems started after the coming of patriarchy!

**AC:** Also, in adivasi society there is no concept of women being pure or impure.

**RP:** That is true of dalit society too. Women are not considered unclean or impure during menstruation. Such a concept does not exist.

**AC:** Now let us focus on the changes in adivasi and dalit communities. At the end of the 19th century we find three main changes impacting the adivasi communities. The first was education. In South Gujarat, mainly in the Baroda state areas or 'Gaekwadi' as they are called, free and compulsory primary education was started during the last decade of the 19th century. Later, at the beginning of the 20th century, in the British areas too, hostels were started to encourage education among adivasi children.

**RP:** Among dalit communities of north and central Gujarat too education first came in the Baroda state areas because of Sayajirao Gaekwad. But few know that Sayajirao Gaekwad also started sanskrit *pathshalas* for Dalit Brahmins with a view to facilitate greater assimilation.

The Arya Samaji's also adopted a similar strategy and some dalits were given the status of *pundits* and they officiated at dalit ceremonies. Because of this some Dalit Brahmins, known as 'Garu Brahmins' in Gujarat, learnt Sanskrit *shlokas* including the *Gayatri mantra* and other mantras used in rituals. In this process the secret mystical knowledge traditions, of which the Garos were the traditional custodians and transmitters, was eroded. They even had a secret script in which this knowledge was recorded and transmitted from generation to generation and this too was eroded.

**AC:** In the case of the adivasis, a few years after the introduction of education, the first generation of adivasi teachers emerged and they started thinking of social reform. One also finds the confluence of the bhakti movement and social reform in this generation. When in 1899 the great famine occurred throughout Gujarat on a large scale, tribals lost their lands to moneylenders. Consequently, land issues became important and central to their deliberations.

By the beginning of the first decade of the 20th century, we find the growth of *bhajan mandalis* in South Gujarat. Deviya Bhagat, Jeevan Bhagat of Vedchhi, Sonji Bhagat, Gopalji Bhagat and Tetiya Patel were the pioneers. Bhajan mandalis were not only collectives for singing religious songs but became fora for discussing the burning issues of the day, mainly land issues. Bhajan mandalis became the vehicles of awareness and adivasi leaders increasingly focused on organisational matters. By 1913, Kotla Mehta, Naranji Babar, Tetiya Patel, Amarsinh Gamit, Jeevansinh Valvi and Raisingh Chaudhari initiated the Kali Paraj Parishad. At that time, adivasis were referred to as *kali paraj* or dark people. Later on, in the '20s, this term was replaced by *rani paraj* or forest people.

**RP:** Among the dalits too, early mobilisation took place in South Gujarat around the legendary dalit martyr Vir Mahya. As you know, in the 11th century, the great Chaulukya king Siddharaj built a huge stepwell. But the well was dry and it was said that if a man of exceptional qualities was sacrificed, water would burst forth. After a great search they found one such man, the dalit Vir Mahya. Vir Mahya was ready to give his life, but in exchange for his sacrifice he laid down several conditions for the betterment of his community such as the removal of the broom that dalits had to tie behind their backs and the spittoon around their neck. He also demanded that a part of the harvest be given to them. This dalit charter of human rights was accepted by the king and the community. Thus, Vir Mahya's community of *vankars* or weavers began calling themselves Mahyavanshis. Similarly, the name of the great Saint Rohidas or Ravidas was invoked by the *chamar* community.

Thus, in the early 20th century legendary dalit heroes and saints such as Swami Tejanand, Guru Valmiki and Matang Swami were reinterpreted and re-established and dalits tried to link their identities to them.

**AC:** Coming back to the introduction of education among adivasis. Education brought with it the value system of the non-adivasi world. You know that in adivasi society women and men had equal status, both in daily life and decision-making. But education brought patriarchal values and one can say that adivasi society was not untouched by these. So the status of women declined and they lost some of their earlier authority. Though the spread of the bhakti movement in adivasi areas was also in fact a process of Hinduisation or Brahminisation, leaders in the early

years, like Ghulam Maharaj, tried to reaffirm the equality of the sexes which was inherent to adivasi society.

Throughout the previous century adivasis fought against authority – moneylenders, local officials or representatives of the princely state – but they generally identified the source of injustice at the local level. This is also true of the adivasi areas of the north adjoining Rajasthan. By the second decade of this century, it was realised that the source of injustice was in fact the British empire or colonial rule and the local exploiters or despots drew their power from the British rulers. They realised that the struggle actually had to be directed against the British. This is why the Kali Paraj Parishad decided to invite Mahatma Gandhi.

**RP:** The nature of the dalit contact with the British was different. After the establishment of British rule in Gujarat, British officers needed domestic servants. The upper castes would not enter such service and so dalits became cooks and domestic servants in their households. After retirement, many officers took these servants with them to England or Africa where they prospered economically and educationally.

In South and Central Gujarat, dalits came in contact with Christian missionaries. Many dalits, in search of human dignity, converted to Christianity. North Gujarat was relatively untouched except for the adivasi pockets of Sabarkantha.

Thus, before the coming of Gandhi, the two big influences were Gaekwad and Arya Samaj on the one hand and British officials and missionaries on the other. It should not be forgotten that there was no anti Brahmin movement in Gujarat during the 19th century and we have no parallel to Mahatma Phule or Shahu Maharaj. In the absence of such leaders and movements, most of the dalit educated class was attracted to reform through the bhakti movement or they focused on their respective caste organisations through which they tried to initiate reforms within the caste. A number of dalit castes also prepared their caste constitutions at this time. With the coming of Gandhi, after 1915, many dalits joined the Congress and participated in the Gandhian movement in a big way.

As far as the land struggle among dalits was concerned, it started subsequent to similar movements in tribal areas. In the early '60s, the struggle around land started in Saurashtra and continued for more than a decade under the leadership of the Republican Party. More than 2,50,000 people went to jail and the government was forced to allocate a sizeable amount to feed prisoners. This special allocation was popularly known as 'dalit budget'!

**AC:** Coming back to the entry of Gandhi, the Kali Paraj Parishad invited him in 1919 to their Sheikhpura conference. Kasturba attended instead of Gandhi. I should mention here that by that time adivasi leaders had developed complete trust in Gandhi. Earlier, while they did listen to non-adivasi leaders or visitors, they never really trusted them.

Some adivasi leaders felt that though our ultimate confrontation would be with the British, local struggles against the *sahukars* and landlords should continue. As a result, parallel to the Gandhian movement, another adivasi movement mainly focusing on land issues continued till independence. They also formed organisations like the Adivasi Khedut Mandal or Adivasi Farmer's Organisation. A magazine called *Chingari* (Spark) was started in 1929 which became the organ of the movement. The editor was Jeevansinh who belonged to the Gamit tribe and who had studied till the second year of college. Apart from local news and views, he also commented on national and international developments.

In 1934, they undertook a *padayatra* and submitted a memorandum to the Maharaja of Baroda. There were four demands – land to the tiller, establishment of co-operatives, steps against adivasi indebtedness, and the abolition of penalty on parents whose children did not attend school. For the first three demands they had virtually prepared alternative legislation and specifically demanded their enactment with the implementing machinery.

**RP:** In the '30s, among the dalit textile workers, the most powerful were the *mukadams* or 'jobbers' who were also called masters. The mukadam was not only a textile worker but also recruited fresh labour from the village. Many dalits joined the Majoor Mahtajan on its formation. Some of them became members of the executive committee and were referred to as members. Gradually the power of the masters waned and the members' influence grew since the mill owners were open to the influence of the mahajan who in turn was influenced by the members. Of course, the members were khadi clad Gandhians whereas the masters turned to Babasaheb Ambedkar and invited him to Ahmedabad in June 1928 and July 1931.

During this period the members, who were also dalit representatives in the Congress, were perceived by the common dalit worker as exploiters. Even now, within the dalit community, the term 'member' is used with contempt.

After Independence, two major agitations were initiated by the dalits of Ahmedabad. The first was

around hotel entry and the other around motor entry or entry into city buses. Later, the hotel entry movement spread to Surat, Bharuch and other cities.

The third important agitation was for entry into temples and this was resisted by the Congress leadership, including Sardar Patel. The agitation to enter the Swaminarayan temple of Kalupur turned into an interesting legal battle which reached the Supreme Court. The Swaminarayan temple authorities pleaded that they were not a Hindu sect but an independent sect of their own and therefore outside the purview of the Act! The same stand was taken by Jains and other sects.

I should add that dalits also struggled against *veth* or forced, unpaid labour in both the princely states as well as British territories.

**AC:** Among adivasis too, the agitation against *veth* took place as early as the beginning of this century. As you know, Guru Govind, who had followers in the adivasi areas of the Panchmahal district at the border of Gujarat and Rajasthan, preached not only against liquor and other vices but also exhorted his followers to resist forced labour. This was one of the main reasons which led to the massacre of about 3000 Bhil adivasis in 1912 by the British. This massacre took place on the Mangadh Hills on the Gujarat-Rajasthan border and is almost a forgotten chapter in the history of our freedom struggle.

Rameshbhai, you started with people without history and the story of the Mangadh massacre is an example of the erasure of history.

Coming back to the '40s, militant struggle against land alienation started in South Gujarat. The Kisan Sabha played an important role and Indulal Yagnik, Pangarkar (Maharashtra), Jeevan Chaudhari and Ramji Chaudhari became household names in the second half of the '40s. This Kisan Sabha drew its inspiration from Swami Sahajananad of Bihar. In fact, one section of adivasi leaders from the Songadh area even prepared primitive bombs.

**RP:** This kind of agitation around land issues was never started by the Kisan Sabha in Saurashtra or North Gujarat. I think it took place in the adivasi areas of South Gujarat mainly due to the presence of Indulal Yagnik.

**AC:** In fact, the activities of the Kisan Sabha were initiated in the Songadh area by the same Jeevansinh who started the *Chingari* magazine which I referred to earlier.

**RP:** It is a noteworthy coincidence that in 1938-39, among the dalits too, someone started a magazine called *Chingari* in Ahmedabad.

**AC:** At the time of the Haripura Congress in South Gujarat, when Subhash Chandra Bose was Congress president, the members of the Kisan Sabha organised a rally of 10,000 people and submitted a memorandum to Bose. They demanded an end to the *hali pratha* or bonded labour and land to tiller. Sardar Patel was not sympathetic and told the Kisan Sabha members that they were like mosquitoes which he would crush between his fingers. He added that since it was a Congress session, he did not want to create any problems at the time. Bose, however, was sympathetic and in his presidential address stated that if poor people did not benefit from the freedom movement, then freedom was of no use.

In the same year, on the night of 8 August at Ghulam Maharaj's village, 15,000 Adivasis gathered and resolved to fight for the end of British rule. They met again a week later and this time over 100,000 people attended and resolved to force the British to quit India. This was a historic event, another little-known chapter in the annals of the freedom struggle.

Till the middle of the present century, we find three main streams of resistance among the adivasis. The first goes back to the middle of the 19th century. In 1856, the Bhils of Gujarat revolted against the British. During the 1857 revolt, the Bhils of the Satpura area around Narmada supported Tantia Tope and continued armed struggle till 1860. The second stream can be traced to the entry of Mahatma Gandhi and the participation of tribals of South Gujarat in non-violent *satyagrahas*, particularly the Bardoli *satyagraha*, the Salt *satyagraha* and the Quit India movement of 1942. They went to jail in large numbers.

The third stream which started after the introduction of modern education, mainly under the leadership of Kotla Mehta, continued in the form of violent agitation against *sahukars* and landlords. All these three kinds of agitations continued simultaneously. After Independence, the leadership of all these streams was either crushed or sidelined. Even those teachers and leaders who fully identified with the Gandhian mode and the Congress too were marginalised by the new political elite.

By the late '50s, the natural leadership among the adivasis, which was close to the community and which emerged from the struggles and movements, virtually disappeared from the public space. By the '60s, the established non-adivasi leadership of the Congress projected its proteges and this trend continues in the Congress party even today.

**RP:** After Independence, among dalits there were four important streams of struggle, all of which are associ-

ated with the Ambedkarite movement. Under the banner of the Republican Party, dalits fought a long drawn out battle around the land issue, mainly in Saurashtra.

The second was *dharmanantar* or conversion to Buddhism under the influence of Babasaheb Ambedkar. After 1956, a number of educated dalit families embraced Buddhism to assert their identity. A large section of dalits, including myself, believe that Babasaheb Ambedkar is the only messiah of dalit communities.

The third stream was directed by the new, militant leadership which emerged from *akhada* activity, particularly in Ahmedabad and nearby towns. Akhadas or gymnasiums existed in the pre-independence era and these were further strengthened. The generation which emerged from the akhadas later became the pillars of the Ambedkarite movement.

In the '70s, we see the beginnings of dalit literature, mainly inspired by the Dalit Panther movement. In the last 20 years or so, dalit literature has taken great strides.

In the '80s, the dalit communities of Gujarat experienced two rude shocks. The first was the anti-reservation agitation when, for about 102 days, the upper caste *savarna* communities of Gujarat who opposed the reservation system, perpetuated atrocities in urban as well as rural areas. Dalits started a counter agitation and resisted with whatever capacity they had.

During the second anti-reservation agitation of 1985, the adivasi belt was also involved and their counter agitation was powerful enough to repulse the upper caste assault in their areas. Due to their human geography and numerical strength, the adivasis were able to pay the upper castes back in the same coin. Because of this significant development, for the first time the adivasis and dalits realised that they had to continue their struggle jointly.

The second anti-reservation agitation of 1985 started with the hike in quota for the other backward castes (OBC) or Mandal communities in Gujarat. As a result, the OBCs also realised that the so-called mainstream society was resisting their rise. For the first time in Gujarat, the *avarna* vs *savarna* consciousness emerged where dalits, adivasis and OBCs identified themselves with the *avarna* or the so-called communities of the periphery.

It is noteworthy that the so-called mainstream communities continued their anti-reservation agitation against the Mandal upsurge and simultaneously tried to co-opt *avarna* communities under the banner of Hindutva. These Hindutva forces always mix up Hindu

*dharma* or religion, Hindu *samaj* or society and Hindu *rashtra* or nation. Even in recent times, the systematic attacks on missionaries, missionary institutions, Dalit Christian minorities and Muslim minorities indicate that these forces of Hindutva have become aggressive in an effort to deprive the avarna communities of their rightful share.

I feel that the deprived avarna communities are coming together to demand social justice and this trend will become stronger in the coming years. I am hopeful of their collective struggle in Gujarat.

**AC:** After Independence, as I said earlier, the natural adivasi leadership was marginalised. But in 1957, under the leadership of the Kisan Sabha, a big conference was organised to demand an autonomous adivasi state. More than 50,000 adivasis participated in this historic conference. Indulal Yagnik and B.T. Ranadive were also present. It is difficult to narrate what exactly happened immediately after the conference, but the movement for a separate state evaporated. Maybe the communist leadership was not prepared or perhaps leaders like Indulal Yagnik identified more with the Mahagujarat movement for a separate state of Gujarat.

In the initial period of the Naxalite movement, some of the old Kisan Sabha adivasi leaders supported the movement but they were immediately arrested. When Indira Gandhi gave the slogan *Garibi Hatao* in 1971, some leaders with a militant background decided to support her and thus the Kisan Sabha movement, which started in the '30s, lost its vitality in Gujarat.

**RP:** In conclusion, I would like to state that the movement for *asmita* or the assertionist movement among the dalits, inspired by Babasaheb Ambedkar, is powerful but does not aspire to political power. This assertionist movement has always remained at the periphery of power. At the same time, a sizeable number of educated dalits have joined mainstream political parties and have sought positions of political power. As you know, dalits, on the whole, are deprived and exploited and to get immediate relief try to attach themselves to such figures. Unfortunately, dalit leaders holding powerful positions in the mainstream political parties or the power structure, also try to disempower assertionist movements among dalits. This is why such movements remain weak.

**AC:** During the Navnirman movement in 1974, there was unrest among adivasi students too and they demanded the resignation of Congress leaders who were running educational institutions. In 1981, the entire adivasi belt from Bhiloda to Umergaon res-

ponded to the anti-reservation agitation though very few adivasi government servants and officials extended support. In 1985, these sections too joined the movement. But the limitations of the government and a lack of political will to protect even the constitutional rights of dalits and adivasis was exposed.

I should emphasise that though 1981 is remembered as the year of the counter agitation by dalits and adivasis, in the border areas of Surat and Bharuch the period is remembered as the beginning of the Valia movement which started off as an agitation for minimum wages and subsequently turned into a struggle against land alienation and adivasi right to cultivate forest land. After many twists and turns this movement has taken root in South Gujarat as a resurgence of adivasi assertion focusing on the right to natural resources.

Another dimension was added in the '90s after the Global Earth Summit. For the first time the adivasi struggle established linkages with the global struggle of indigenous and tribal peoples.

I fear that the kind of confrontation which took place in Valia over access to natural resources will only intensify in the coming years, given the climate of liberalisation and globalisation and the emphasis on the exploitation of natural resources. Since adivasi areas are repositories of great mineral wealth and other natural resources, massive industrial expansion has begun in the eastern tribal belt and more and more adivasi families are being ousted from their ancestral lands and joining the army of development and environment refugees. Even in the Scheduled Areas, despite specific laws to prevent it, land alienation is an everyday story.

Looking from this perspective I think that the struggle around basic resources will intensify not only in Gujarat but throughout western India. After Independence, the development model has only increased impoverishment among adivasis. Now, the state and market have come together to further marginalise them.

Thinking adivasis feel that the development model is pitted against them and the New Economic Policy is nothing but another step in that direction. This section has mobilised adivasi communities of western Gujarat under the banner of the Adivasi Ekta Parishad. This organisation has gone beyond the reservation policy or Panchayati Raj Act by focusing on issues which affect adivasi life and survival, such as access and right to natural resources, preservation of adivasi heritage and a change in the value system of society towards sustainable development.

**ON THE SALT MARCH: The Historiography of Gandhi's March to Dandi** by Thomas Weber.  
HarperCollins, Delhi, 1997.

IF there is one event from the pre-independence era which continues to capture the imagination of people, commercialised though it may have become in recent times, it is the Salt Satyagraha. In 1930, Gandhi and 78 others set off on a 25 day march from Ahmedabad to Dandi to break the salt laws and start the fight for *purna swaraj*. While scholars continue to quarrel about whether or not the satyagraha enjoyed mass support, the event has become a popular symbol of patriotism and sacrifice, finding mention even in Hindi film dialogues.

After Independence this event has been restaged numerous times, the first in 1970 when a group of students from the Gujarat Vidyapeeth walked to Dandi to mark Gandhi's 100th birth anniversary. Since then ordinary citizens, foreigners on cycles, social activists protesting against iodised salt and multinational salt companies, and even one of our prime ministers have re-enacted this event. The most recent staging was in March this year, flagged off by the lone survivor of the

original group. This time it was to celebrate 50 years of Independence. For this occasion, Gujarat's tourism department began a six-day package tour starting in Ahmedabad and ending in Dandi. 'Taste the spice of the Indian Independence Movement walking with the Mahatma to Dandi on the Salt Satyagraha,' goes the advertisement.

Thomas Weber made the trip in 1983. He walked along the same route, leaving at dawn on 12 March, stopping at the same villages and making salt from seawater on the morning of 6 April, just as Gandhi had done. But with a difference. Juxtaposed with the narrative of his experiences along the way (a chapter for each day) is the account of the very same day in 1930. Weber's aim was not merely to retrace Gandhi's steps but to document Gandhi's thought processes, the drama and atmosphere, as well as the experiences of those who were touched by the event.

There are books galore on the Dandi march but no other account gives the reader such a feeling of proximity to the past. Gandhi's struggle to find an issue, his choice of salt, his decision to march, the selection of the route and marchers, preparations for the actual event and what happened on each day *en route* – all

this is vividly sketched. With a sense of humour, he describes how the volunteer band which was to see Gandhi off began to play 'God Save the King' before realising its mistake and subsiding into confusion!

Weber has also unearthed the minutest details – the menu at each village halt, where Gandhi lost his temper, whether he actually walked as fast as he is supposed to have, and how the famous photograph of Gandhi bending to pick up salt was not snapped at Dandi but at a nearby village. All this makes the reader feel that he (or she, though Gandhi did not allow women to join) is one of the marchers too.

The simultaneous narrative of Weber's experiences while walking the same route provides a fine counterpoint with the situation some five decades later. His meetings with people along the way, their memories of the day Gandhi passed through their village, what he said to them, the atmosphere then – all this comes alive. So does the lack of knowledge about the villages' history among present-day youth, the un-Gandhian lifestyle of formerly staunch followers and their emigration to the West.

Weber has accomplished this through painstaking research at archives and libraries, diligent cross-checking and, above all, through conversations with the surviving marchers and people in villages along the way. This is the real strength of the book and his contribution to the historiography of Gandhi's march to Dandi. All other accounts, including that by Judith Brown who is considered an authority on this satyagraha, only quote Home Office files, police and newspaper reports or at best Gandhi's own writings or those by other prominent politicians of the day. The Gujarati versions are mostly nationalist clones. No scholar writing on this subject has combined archival material with oral history so seamlessly and readably. Probably the only exception is Professor Dalton at Columbia University, whose engagement with the salt satyagraha goes back to the sixties and who had the advantage of interviewing many of the original marchers while they were still young and their memories fresh.

Paradoxically, the book's strength is also its weakness. Weber had the unique chance to meet the actual people associated with the event. Yet, he has left many important aspects unexplored. He has not, for instance, attempted to seek out dalits or Muslims or women along the way, thus losing an opportunity to reveal the real nature of Gandhi's mobilisation. He was probably unaware that apart from these groups, another significant section of society from whom

Gandhi received support during the satyagraha were the adivasis. Their contribution remains unacknowledged, not just in this work but in most others.

Most scholars agree that the key achievement of the Salt Satyagraha was the emergence of women into the arena of the freedom movement. Yet, apart from the 105 year old Gangaben, Weber did not speak to any women along the way. In 1930, she led the picketing against liquor shops, but Weber's conversation with her reveals more about the cooking arrangements at the Sabarmati ashram. What motivated women, where did they draw the courage to overcome traditional restrictions, leave their homes and help their menfolk to boil seawater, join pickets or court arrest? What drew them to Gandhi? None of these or other aspects related to the entry of women into the movement features in the book.

Nor has Weber thrown any light on the dalit question, though he does note that concurrently with the Dandi march, the harijan community had initiated temple entry campaigns in Bombay, Nasik and Poona. Indeed, they threatened to launch a counter satyagraha against Gandhi because they felt that he had sacrificed the interest of 'untouchables' for the sake of *swaraj*. They even planned to block the removal of 'illegally manufactured salt' by placing their 'polluting' bodies in the way of volunteers.

Weber did meet two of the 'untouchable' members of the original group. But here too he provides no insights apart from the fact that one of them was jovial and the other a good musician. What was it like to be an 'untouchable' marcher in caste-conscious Gujarat? Did they receive the same treatment as the others along the way? What were their memories of dalit issues and leadership of the time – Weber has not discussed these aspects. Nor did he seek out dalits in the villages he passed through (though on day four of his march he had vowed to 'engineer closer links with the less affluent on this trip'). Not even in Gajera, where Gandhi made a point of refusing to speak unless the untouchables were allowed to join the general audience, or at Rayma where a harijan returned the land he had received from the government. A few interviews with the dalit elders of such villages could have provided a valuable first-hand account of the dalit response and contribution to the Salt Satyagraha.

Equally distressing is the silence on the Muslim question. Weber rightly observes that the Salt Satyagraha failed to cement deteriorating Hindu Muslim ties. One wishes that he had talked to some Muslim elders on the way, specially in villages like Napa,

Buva and Jambusar where they were present in sufficient numbers and inquired why they did or did not attend the public meetings as also their impressions and assessment of the event. Weber met Abbasbhai, one of the two Muslim marchers, but there is nothing which reveals Abbasbhai's feelings about being a Muslim in Gandhi's movement or his memories of the general antipathy of the Muslim community towards Gandhi. The book's detailed day to day descriptions reveal that Gandhi tried to use examples from the Koran to woo Muslims. A few interviews could have revealed what Muslims felt about this.

It does appear that the bulk of Weber's interviews were limited to elderly, upper caste Gandhians. But even with this group he has remarked but not reflected on the decay in Gandhian values. The reader is left wondering as to why these former Gandhians subsequently turned to the West and to materialistic lifestyles. What does this generation of freedom fighters think of the erosion of these values in their own lives, values for which they were ready to risk everything earlier. Weber has left this interesting aspect unexplored.

This reviewer felt a sense of disappointment at these omissions in an otherwise significant book. More so because Weber was probably the last person to meet this generation of people while they were still in good health and able to respond to questions about the past. The opportunity to fill these gaps in our understanding of this important satyagraha is lost forever.

Suchitra

**INDIGENOUS CAPITAL AND IMPERIAL  
EXPANSION: Bombay, Surat and the West  
Coast** by Lakshmi Subramanian. Oxford University Press, 1996.

Lakshmi Subramanian's work was first noticed when her articles and subsequent responses were published in the journal *Modern Asian Studies* in 1991. Ever since her book had been eagerly awaited. The book deals with trade relations and the new trading order as it emerged in the 18th century on the west coast of India in exhaustive detail.

Surat has been a focus of successive studies as the nerve centre of international and inland trade and finance during medieval times. M.N. Pearson, Furber, and Ashim Das Gupta chart the history of Surat from the 15th to the middle of the 18th century. Subramanian's work recounts the developments of the 18th century, bringing Surat's story upto the 19th century.

This story parallels that of medieval India. The decline of the social and political order under the later Mughals, the rise of the East India Company, the decline of textile production and the growth in export of raw materials – the success of colonisation. Unlike the well documented rape of Bengal, the collaboration of the west coast has received scant attention. Subramanian details the western Indian collaboration, identifies the individuals and documents the profits within a macro frame. She even manages to lay bare the compulsions behind the collaboration, the weaknesses of the Company, and the way the 'natives' made money at its expense.

With the disruption and decline of inland trade due to the Maratha-Mughal wars, the financial wealth of the bania shroffs became idle and they were on the lookout for alternative investments. Since the English East India Company was somewhat behind with its revenue collections in Bengal, it urgently required additional finance. For the banias, the Company's desperate need and its liquidity position ensured a favourable rate and assured return, thus proving a most profitable source of investment.

The Company used the finances for the development of Bombay Presidency – the expansion of territory, war with the Marathas, providing protected shipping for the local merchants, and above all for investment in cotton which it exported to England and China. The export of piece-goods continued, but since the weavers were tied to the banias and traders who advanced finances, they were coerced to sell to the Company as the sole buyer, thus unable to negotiate favourable prices and remuneration.

Subramanian details the financial transactions well. In contrast to the confusion and dissension among the Indian merchants and rulers, the Company comes across as determined and single-minded in its pursuit of profit and success. This single-mindedness is complicated by the differences between Company officials in Surat, Bombay and Calcutta, which makes her account complex and contingent rather than deterministic.

In addition to outlining the economic changes, the author documents the rise of a new social order. This social order, she assures us, resulted from the collaboration between the British Company and the banias. The rise of the trading class and its economic strength is contrasted to the decline of the artisanal class in Surat. The latter decline is linked to the disorderly and lax administration that could no longer police the city. With the Company taking greater steps for the security of the traders and subsequently

even the judicial function, order is described as being 'restored'.

Her treatment of social displacement requires careful attention as it purports to explain the birth of a new Surat. On the one hand she sets up the bania-trader as Hindu and the displaced militia and artisan as Muslim. On the other, she describes how the artisan groups of Surat were both Hindu and Muslim. The list of weavers groups included Hindu castes – the Khumbees, Khatris, Malwae and Pancholees – Muslims, Boras and Bhandarees (a Muslim caste), and Parsees: (Table vii, pp. 209-210, weaving occupation structure in 1795.) Clearly, the artisan class was far from exclusively Muslim, even though there was community specific specialisation. Nor did the residential patterns follow communal lines. The same *mohallahs* housed bania and Muslim residences (p. 212).

Nevertheless the author classifies the riots of 1788 and 1795 as communal, involving disaffected Muslim artisans and military classes attacking the collaborationist Parsees and banias. On the one hand she cites economic dislocation, and on the other religious sympathies. The immediate provocation was the tying up of a Bengali Muslim Syed of a mosque. The attack, therefore, is framed as retribution by Muslims on Hindu banias.

Though the scenario is neatly and convincingly laid out with a right mix of economic and social-cultural factors, the question remains: If the artisans were disaffected, did the Hindu artisan castes also join the attack? Were they separately dealt with? According to the author, the Muslims raised the slogan of *char yaree*. This was a Sunni slogan. What about the Bohras, who are Ismaili Shias? They were also successful traders. How did they fare in the riots?

Since the 'communal' explanation does not cover all angles, is it at all fair to use it? Subramanian foregrounds the social changes as an explanation for the 'riots' of 1788 and 1795. She categorises the riots as Hindu-Muslim and thereby communal. In today's surcharged atmosphere, labelling a riot or conflict as 'communal' demands sensitivity, otherwise parallels are drawn with modern events. A failure to do so only fuels the 'civilisational enmity' thesis that justifies all communal conflict and discrimination.

The social-structural changes the author discusses, though a welcome addition to a work that otherwise concentrates on tracing the financial deals in the market, are nevertheless inadequately dealt with as the scholar is primarily interested in the world of finance and trade.

The importance of the 18th century with the availability of local capital would have been highlighted had it been contrasted with the 19th century with the dominance of the European companies, agency houses and traders. Subramanian's story provides the backdrop from where it is possible to question the inevitability of colonisation.

While questions like 'what might have been' are rather pointless, it would be worthwhile to examine and assess processes of indigenous finance and draw connections between bullion flows and changing ownership of capital. Despite Subramanian's careful attention to the events of the 18th century financial world, her account does not assess the developments in Surat in terms of the story of colonisation. It seems as if she has shied away from drawing long term implications.

**Amrita Shodhan**

**FEEDING THE BANIYA: Peasants and Usurers  
in Western India by David Hardiman. Oxford University Press, 1996.**

David Hardiman has made western India and Gujarat in particular his favourite area of study and research. He has already published extensively on different aspects of the region. The present book is an exhaustive and in-depth study of usury (usurers, banias, moneylenders) in the region, including the relationship between the bania usurers and their clients, the peasants. He deploys a variety of concepts – 'hegemony' (Gramsci), 'dominant discourse', 'hidden transcript', 'cultural notions of debt and credit in peasant societies' (Bourdieu), 'forming principle' – with reference to 'the interplay between knowledge of the structure and the actual practice of power in that sphere' (Foucault). He combines social, religious, political and economic aspects of usury with the points of view of both the bania or *sahukar* as exploiter and the peasant/labourer, the borrower and the victim.

After examining the historical meanings of usury in both western and Indian traditions, the author defines usury as 'an exploitative relationship in which the creditor has power over the borrower. The creditor has control over capital, which is advanced to subordinates, who in turn have to pay interest on the loan, which can be in kind, in money or in labour.' At the same time, in the context of the (western) Indian tradition which he has researched in detail, he emphasises that the relationship is not merely of 'the exploiter and the exploited' but rather of 'the patron and the client'

as well, one in which both parties respect the social values intertwined in this relationship. This, he explains, is what often saved the bania from violence and death, including during disturbances and rebellions against usurers.

He details the history and practices as well as the economic and political position of usury in the pre-colonial and colonial periods (chapters 2, 3 and 13) and in the post-colonial period (ch. 14), and explains the post-independence changes by what he calls the 'metamorphosis of usury' (ch. 14).

In the pre-colonial period the baniya, to sustain his 'hegemonic' role, had to depend on the social values and practices as well as the accepted moral and cultural norms and values. The colonial regime saw the baniya as its ally, given his ability in some areas to collect land tax, either directly or by advancing cash to the peasants at the time of land revenue collection. Consequently, the colonial regime consciously tried to improve his position in society by providing better institutional and infrastructural facilities like civil courts, recovery laws, law decrees, legally backed confiscation of goods and land-holdings. This greatly enhanced the power and domination of the usurer. But, Hardiman points out, the baniya and his institution of usury were not allowed to become collaborating partners of the colonial rulers.

The Time of Account (ch. 9) provides a socio-economic and cultural background of the society in which the baniya operated. It describes the banias' accounting practices the various methods of subterfuge and manipulation which perpetuated his dominance over a peasant client. The manipulations of the institution of law are also amplified. For the peasant, this is akin to a fly walking into the spider's web. The state may, in an attempt to be fair to the peasant-borrower, a weaker party in this game of exploitation, prescribe various safeguards; but the bania's *modus operandi* only improves with time and new challenges.

Chapters 10, 11 and 12 deal with the times of tension in rural society. Colourful accounts of the protests and rebellions against the banias (sahukars) in Maharashtra, Gujarat and Rajasthan are furnished. The author stresses that the relationship between the baniya and the peasant borrower was not purely antagonistic and/or confrontationalist. There was a significant paternalistic, patron-client bond, a relationship which continues. This is what saved the baniya from physical violence. The revolt took the form of burning books of account and debt bonds, seen as the evidence and symbols of unjust oppression.

The author while discussing the causes, effects and methods of peasant resistance to usury has argued successfully against the thesis propounded by N. Charlesworth ('The Myth of the Deccan Riots of 1875', *Modern Asian Studies* and *Peasants and Imperial Rule: Agriculture and Agrarian Society in the Bombay Presidency, 1850-1935*, Cambridge, 1985) that the Deccan riots of 1875 were similar to the 'grain riots' in Europe.

The western Indian riots were essentially against the oppression of usury and the refusal by the usurious class to do its bit by the poor peasants in times of famine or near famine. The riots (and the less than extreme results) were thus directed against the usurer choosing to upset the paternalistic client-patron relationship, just when it was most needed.

The author argues that these struggles revolved around what the peasant debtors saw as 'unrighteous behaviour' on the part of the banias, considered superior to the peasants in the social hierarchy. But he does not probe all the aspects of the banias' practices on such a scale of righteousness. Neither does he explain why the peasant borrowers do not apply these standards during normal times.

Chapter 14 describes the development of usury in the post-independence period, the 'metamorphosis of usury'. Simply stated, the baniya proved adept at successfully cornering the new economic and social opportunities created by development.

The new measures providing larger rural credit at reasonable rates of interest and conditions of repayment with protection to the borrowers were evolved on the basis of studies and surveys conducted by government bodies and institutions. One such study spawned a slogan: 'Cooperatives have failed; Cooperation must succeed.' Typical of the mentality of the educated middle-class elite that dominated bureaucracy and technocracy after Independence. The slogan generated a feeling that half the problem was solved; the other half was to be solved by the momentum generated in action by the slogan. Nothing of the sort happened. As a matter of fact, the slogan ironically succeeded in a reverse way: 'Cooperatives succeeded, Cooperation failed'!

Cooperatives were established for supplying credit in the rural areas; purchase and sale of expensive, modern farm implements; supplying seeds, fertilisers and pesticides; marketing of agricultural produce and so on. The baniya moved into the sphere of marketing the new implements and machinery, fertilisers and seeds. When the cooperative society

assumed importance in rural India because of support from the political system the baniya moved in and took control, given his superior commercial skills and contacts with the large land-holders. The cooperatives thus come to be dominated by the rural rich who now also included, besides the baniya, rich land owners with surplus funds generated over periods of scarcity and then the green revolution. The poor peasant, for whom the slogan was devised as a solution, found himself a member of the cooperative, but only for the purpose of exploitation with better institutional and now open political support for the exploiter. Thus, any institution devised in the modern economic and political system, ostensibly to overcome the ills of usury, is transformed and co-opted by the rural rich. The traditional ways of exploitation are retained (the traditional baniya usury continues for both the small peasant and the landless labourer) and are refined into new ways and institutions to suit the dominant classes.

Hardiman does not offer any solutions. The present economic situation and the policies/programmes/actions of all the political groups hold little hope for rural India where usury would be a thing of the past. Borrowing, which does not lead to an increase in the earning/paying capacity of the borrower, only creates a debt-trap which suits the usurer. As long as this non-productive borrowing is essential to the peasant, the usurer will remain indispensable.

In a regime of small and marginal farmers, uneconomic holdings and subsistence agriculture, usury will continue. The bania will progress and devise new and more efficient ways and institutions to continue his oppression and domination. Unless the small and medium peasant's (and also landless labourer's) need for emergency and unproductive borrowing is eliminated, one cannot see the back of the baniya. Land reforms are welcome, but, let it be clearly understood, insufficient. Land reforms cannot reduce the number of small, marginal, subsistence farmers. Similarly, rural agro-industries: the growth of sugar mills and sugar cooperatives in Surat district in Gujarat (one of the prime areas of the author's study) has not made a significant dent in the situation.

What is required is large scale industrialisation, an emphasis on labour-intensive, small and medium industrial units and agro-industries to provide employment in the off-season months. That would significantly relieve the pressure on land. Last but not least, the spread of education and awareness among the poorer sections in the rural areas about spending habits (which is possible only through social reform move-

ments by voluntary organisations like those in the Gandhian era) is the direction in which rural society and the country must move.

In this age, when most government funds, five year plans, rural schemes included, are deployed either for providing large subsidies to the dominant and exploitative large farmers and rural rich or for building or creating infrastructural facilities like cheap irrigation water and near free electricity, all talk of sympathy for the rural poor or debt-burdened small farmers is not just hypocrisy but downright dishonesty and cheating. The large increase in the population below the poverty line to more than 300 million (equal to the population of India at the time of independence) is adequate proof, if any is needed, of the total failure of our economic and social policies.

**PUBLIC HEALTH AND URBAN DEVELOPMENT: The Plague in Surat** by Ghanshyam Shah.  
Sage Publications, Delhi, 1997.

MOST of us, more so our policy-makers, are blessed with a notoriously short memory. In an environment suffused with uncertainty, serving fickle political masters does seem to contribute to a fire-fighting mode of crisis appreciation and management. So while our frayed institutions do sometimes manage to rise to the occasion, they rarely generate a learning mode which could help them prepare for potential eventualities. Even fewer develop longer term strategic perspectives and plans of action.

In the early years many looked up to Gujarat as an efficient state. Relative political stability and a competent bureaucracy ensured that systems functioned. Not to be forgotten was the contribution of Gujarati society, particularly through its many voluntary organisations. Not so now. The recent 'mishandling' of the cyclone that hit coastal Gujarat is a telling reminder of how disasters assume cataclysmic proportions in situations marked by a decay of both formal (political and administrative) and voluntary institutions.

Many today may have forgotten the outbreak of the 'plague' that hit Surat in September-October 1995. As Gujarat's fastest growing city in the decades of the '70s and '80s, Surat was a booming town. The Bombay textile strike of the early '80s gave a major fillip to the powerloom sector and the associated printing and dyeing trade. The city was also a major centre of the diamond polishing industry.

Economic prosperity attracted migrant labour by the thousands, most of whom were accommodated in the city's burgeoning slums. Wealth, much of it unaccounted, contributed to a building and consumption boom. Unfortunately, in this 'get rich quick' boom town, little attention was paid to the development of planned infrastructure; even less to the evolving of mechanisms to oversee and direct the rapid growth and expansion.

Ghanshyam Shah's insightful action-research study of the outbreak of the 1995 plague and its aftermath locates the handling of the epidemic in the socio-economic background of the city and its populace. Though the disease was controlled within a week, the ensuing panic resulted in a large section of people, particularly the migrant population, vacating the city. Rarely did the outsider observer realise that most of the 'victims' came from this strata.

If anything, the migrant poor were doubly victimised. For a start, they lived in abysmal conditions. They also had to remit a part of their earnings back home. They, unlike the native poor, had few networks and solidarity mechanisms to help cope with the crisis. Above all, when the epidemic struck, like during the communal outbursts of 1992-93, they could more easily be branded as being responsible for the decay of the city.

Shah's study is much too rich and empirically nuanced to present in a brief review. But when a seasoned political sociologist looks at a 'health' disaster – the run up to it and the aftermath – the reader gets glimpses of much more than disease control and disaster management. We learn how different strata of the society perceived and responded to the crisis; how local communities used 'primordial' links of kinship and caste to cope. But most of all, how the extant political and administrative system was so out of sync with the need of the times.

Some of the above comes out sharply in the post-script on post-plague Surat, particularly in the efforts of its new municipal administrator, S.R. Rao. The plague outbreak severely damaged the reputation of Surat. It also pushed the 'powers-that-be' into giving city administrations a relatively free hand to improve the urban area, a move which acquired a greater impetus because of the need to meet the challenges of liberalisation. It was understood that private capital would be difficult to attract in a filthy, ill-managed city prone to health disasters.

The saga of S.R. Rao and how he turned Surat from one of Gujarat's filthiest cities to the second-

cleanest city in the country (after Chandigarh) is well known. Political and administrative will, when backed by public support, can do wonders. This, even when the political masters were reluctant to shed their proclivity to both intervene and appropriate credit. So Surat managed not only to clean up its garbage, straighten out roads, demolish unauthorised structures, but also attempted to put into place systems of public involvement and scrutiny. The story carries many lessons – particularly about how to enthuse unwilling municipal employees. It also demonstrates the need for harsh measures, often difficult to enforce, not just because of union pressures but because interventions have to steer through a complex web of political loyalties and patronage.

Ghanshyam Shah points out, and tellingly, the underside of this success story. First, while the memory of the plague was fresh, people behaved. After a gap, the tendency was to return to the old ways. How to continually enthuse pride in one's civic space and thereby ensure performance remains a challenge. Charismatic leadership helps but is no substitute for durable systemic efforts. Second, the 'success' had a clear class bias. Much less effort was expended in areas of working class (particularly migrant) concentration – be it for work or living. So, one should not be carried away by the surface improvements. Both media and official attention is focused on the accessible spectacular. Like with the recent landslides in Rudraprayag, where local villagers were all but forgotten in the rush to locate the Mansarovar pilgrims, the faceless unnamed in Surat suffered benign neglect. Third, the activation of the official machinery seems to have diminished voluntary enthusiasm. Thus, few groups were willing to take over and work in the slum areas in a sustained way.

The last may come as a surprise to those who have viewed Gujarat as the land of Gandhi (and thus voluntarism). I think what it demonstrates is that the voluntary sector in Surat is ill-equipped to adapt to a shifting environment.

Overall, this is an extremely useful book. It underscores the importance of environmental improvement and preventive medicine to both avert and, if need be, cope with crisis points such as the plague. Methodologically, it weaves in political economy and sociology into epidemiology. Its greatest success, however, lies in providing glimpses of how modern urban Gujarat functions – an aspect routinely absent in tracts on medical sociology.

## COOLIE DOCTOR

*Dr Goonam*

The story of a remarkable woman and her spirited struggle against daunting odds, *Coolie Doctor* is an autobiographical account full of energy, humour and a zest for living. Dr Goonam's evocation of South Africa, rife with social and racial prejudice, is so vivid that the reader shares her concern, her joy and her hope at the end when democracy hovers over the troubled nation.

## THE DOGS OF JUSTICE

*Nina Sibal*

Shahnaz lives her life passionately and finds it taking bizarre turns, from the turmoil of pre-Independence Kashmir to the gas tragedy in Bhopal. She withdraws progressively into a lonely and increasingly destructive existence until the dogs of justice begin their relentless pursuit. Nina Sibal's novel tells a compelling story of attachment and loss.

### Widows, Wives and other Heroines

Twelve Stories by  
Premchand  
(Translated by David Rubin)

The stories present a wide variety of feminine portraits — mothers, daughters, wives, widows and prostitutes — both realistic and idealized, sometimes tragic, sometimes tinged with satire, but always compassionate.

0 19 564217 1 1997 215 x 140 mm 200 pp. Rs 325

### The Essential Writings of Sri Aurobindo

Peter Heehs (editor)

This volume includes writings covering more than fifty years (1893-1950) of Aurobindo's life, arranged in six sections according to his main areas of interest: politics, the Indian tradition, social and political theory, philosophy, yoga, poetry and poetics. There is a general introduction giving an overview of Sri Aurobindo's life and works, as well as brief introductions to each section, textual notes explaining references to persons and events, a glossary of Sanskrit terms, a chronology and suggestions for further reading.

# Backpage

IT has been some years now since 'peace' returned to the Punjab. Terrorism has been officially pronounced dead. With an elected government safely in place and the night life of the state back to its boisterous swing, it does appear that the terror-filled decade of the eighties has been properly interred. Memory, however, rarely behaves in accordance with the dictates of current politics. Few remember that the Sikhs of Punjab did not take kindly to the Akal Takhat being 'officially' rebuilt by Santa Singh after its destruction in 1984. The 'struggle' then was not only over who had the right to re-construct, but also about how the memory of the event was to be preserved.

The bloody decade had 'claimed' not just the Akal Takhat but many lives, innocent and otherwise. Between terrorist depredations and police 'encounters' thousands died, many vanished. The state's claim was that this was a 'fight to the finish'. In the process, rules and conventions were often flouted. 'Necessary', some might say. 'Terrorism cannot be fought with kid gloves.' And since the implications of a Punjab lost to the Khalistani's seemed unacceptable, the rulers of the day acquiesced, as did much of the media. Not so the 'victims' and their relatives. In today's somewhat more propitious times they are demanding justice.

Two probes, one by the National Human Rights Commission (NHRC) into the cremation of a large number of bodies described as 'unidentified' and the other by the 'unofficial' People's Commission set up by a number of human rights bodies, have reopened questions related to the 'handling' of the insurgency. The NHRC attempt to fix responsibility for the gruesome massacre and order compensation for the dependents of those clandestinely cremated by the police is being sought to be derailed by the state. This despite the Supreme Court taking strong exception to the attitude of the authorities. It may be noted that the police had cremated at least 1,238 bodies as unidentified, 585 as identified and 74 partially unidentified (*The Times of India*, 14 September 1998).

The agencies and personnel charged with crushing the insurgency clearly feel betrayed. They had risked life and limb, also of their families. To now be

put in the dock for saving the 'unity and integrity of the nation' appears an unkind cut. 'How could they be expected to fight well-armed militants with their hands tied behind their backs?' This is the common refrain of a force which feels 'used' by the political masters.

The reactions to the People's Commission, seen as 'extra-judicial', are far more severe. The law and order machinery, more so in strife-torn areas, looks upon human rights groups as meddlesome and naive or brands them as anti-national and pro-terrorist. And if probes are instituted well after the job has been done, the interventions are classified as a clear betrayal of the courage and sacrifice of the men on the battlefield. 'Where were these chaps when Punjab was burning?'

The situation in Punjab is made murkier by factional fights in the ruling Akali Dal. Often it is the hardliners in the Dal who aid these probes, as much to embarrass their moderate colleagues as to nurture their constituencies in the ranks of the erstwhile 'boys'. Much as this may sound cynical, but the victims and their families tend to become pawns in a battle of *realpolitik*.

The wounds of war heal but slowly. Half a century after the event, we have still to come to terms with the memories of Partition. The trauma of Punjab is still fresh. Further, there are the demands for justice, for fair play, for a rule of law. The state, even in extraordinary times, must respect the conventions of conflict. Otherwise we will lapse into barbarism.

Both the police and the 'innocent' victims of terrorist violence deserve full consideration, from the state and society. One way may be to institute a Truth and Reconciliation Commission on the lines of the South African experiment. Those charged with executing the counter-insurgency operation must be forced to come clean. Similarly, those who extended support to militancy, including the various human rights groups who argue that the right to secede is an inalienable right of beleaguered nationalities, too must make clear their role. Only then can our society move towards more decent and humane norms of governing itself.

## CARING TODAY FOR YOUR TOMORROW.

Our children, our future, need the utmost care. And at Hero Honda we care.  
For you, your family and the environment.

Hero Honda's superior 4-stroke technology and its high fuel-efficiency makes it  
one of India's most environment-friendly motorcycles

Little wonder, then, that today over one and a half million proud Hero Honda  
owners are making an impact on our environment across the country. Ensuring a  
brighter and a pollution-free tomorrow for the future generation.

Ride a Hero Honda. And show the world that you care.

**Interest calculation to your advantage**

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

**No prepayment penalty**

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

**No annual charge**

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

**No commitment charge**

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan – not before.

**Processing charge on a 'slab' basis**

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

Loans at the sole discretion of ANZ Grindlays Bank.

# ENERGY

## LIFELINE OF THE NATION

For over three decades, Dasturco has been totally involved in energy conservation, its efficient use and management.

Dasturco has incorporated energy-efficient processes and equipment in all projects handled by it. To optimise energy use. To reduce energy consumption and to cut costs. To recover and re-use waste energy.

To cite only a few recent projects :

- ☐ Visakhapatnam Steel Plant.
- ☐ Tata Steel modernisation and expansion.
- ☐ Sunflag Iron and Steel Company.
- ☐ Misurata Iron and Steel Complex, Libya.

Also in alloy steel, mini-steel, direct reduction, ferro-alloys and other energy-intensive sectors.

And computerised energy management, as at Visakhapatnam Steel Plant.

## **An Indian network that's branching out to all the right places.**

Indian Airlines is really growing all over. From 55 destinations like Leh in the north of India to Trivandrum in the deepest south. And to 17 locations overseas which include Colombo, Singapore, Kuala Lumpur, Bangkok, Kathmandu, Karachi, Sharjah, Bahrain and Muscat. All made possible for you by our widest network spanning South East Asia, manned by our experienced workforce of 22,000 professionals.

*Come home to*

This is 3 year old Shreya.  
Her parents abandoned her  
and vanished. If you turn the page,  
you'll do the same.

With no one left in the world, little Shreya doesn't have the slightest hope of facing the future, unless she gets an education. And that's where you come in. To make a dream called

*Nanhi Kali* come true. Through *Nanhi Kali*, you can become the foster parent of a little girl like Shreya.

By giving Rs. 100 a month towards her education, your 'daughter' will be put into school and in fact, you will receive regular reports about her progress including a photograph.

*Nanhi Kali* is a special project of the K.C. Mahindra Education Trust - a

Trust set up by one of the most reputed industrial families in India.

A Trust that's been working since 1953 to promote education and enlightenment across the country.

Since *Nanhi Kali* literally means 'little flower', with people like you, we hope to repair the broken petals of thousands of such underprivileged little girls.

So please don't turn the page yet.

Supported by M/s. Mahindra & Mahindra Ltd.

## ROOTED TO THE CORE ... And headed for the world of the future.

At the core lies a technological strength which has consolidated BILT's position as India's foremost papermaker for over six decades. A strength which propels it into the future.

So that, in 2003 when the Indian paper demand is 5 million tonnes, BILT will meet it with over 70 percent of the brightest, finest papers.

And, as South East Asia starts looking towards India and BILT - for paper, the BILT chemistry will be working in yet another area;

India's largest producer and exporter of phosphoric acid will add one more link to the value-addition chain by making phosphatic fertilizer and pesticide intermediates.

Even as it reaps in returns from corporate agriculture, meshing core strengths with core Indian advantages.

**For BILT, it is back to the roots. Or core strengths, as it were.**

THE MONTHLY SYMPOSIUM POST BOX 338 NEW DELHI 11000

Founder Editors RAJ & ROMESH THAPAR

A journal which seeks to reflect through free discussion, every shade of Indian thought and aspiration. Each month, a single problem is debated by writers belonging to different persuasions. Opinions expressed have ranged from Janata to Congress, from sarvodaya to communist to independent. And

the non-political specialist too has voiced his views. In this way it has been possible to answer a real need of today, to gather the facts and ideas of this age and to help think people arrive at a certain degree of cohesion and clarity in facing the problems of economics, of politics, of culture.

# The problem

FROM the pariah, an untouchable whose very shadow was considered polluting by orthodox caste Hindus, to the present-day dalit has been a long journey – troubled, contradictory, painful. For the different communities, juridically encapsulated within the bland and official category of scheduled castes, receiving recognition as an equal citizen of a democratic republic, far less the recovery of self-hood, is a project still waiting to be actualised.

The recent killings of dalits in Ramnathapuram, unfortunately an all too common and continuing occurrence, is symptomatic of the deeply held prejudice and hatred which marks our society. More distressing is the fact that none of the emancipatory projects – the Buddhist revolt, medieval bhakti movements, the creation of new religious cults, conversions to Christianity, Islam or Sikhism, the renaming of untouchables as harijans, or the secular efforts at affirmative action, political reservation, and the quest for political power through new political parties and formations – have so far made a significant dent in the existential situation of the dalit communities.

The reports of the National Commission on Scheduled Castes and Scheduled Tribes are a grim reminder that the vast majority of the dalits remain poor, illiterate, lack the requisite skills for competing in the modern world, enjoy unequal access to productive resources, and remain deeply tied to land and traditional occupations which offer limited possibilities of upward mobility. Untouchability, though banned under the law, continues to be widely practised. And despite the emergence of a dalit middle class, and a steady (if small) encroaching in the arenas of education, jobs and professions, there is little evidence of a *roti beti vyavhar* across the caste rubicon.

Is it that caste consciousness, particularly the seemingly unbridgeable divide between the 'twice-born' and the 'ritually polluting' is much too deeply embedded in our collective psyche to permit anything but a complete rupture? Even conversion to religions which doctrinally disallow caste has not helped dalits evade stigmatization, not just *vis-à-vis* Hindus but even within their new religious communities. Is Fannonesque violence, a complete and violent overthrowing of the social order, then the only answer?

Much of what we witness as dalit politics is a reflection of this troubled relationship. Dalit assertions, be they for identity or for secular gain, often confront hostility. The Gandhian project, which involved renaming them as harijans alongside campaigns to eradicate untouchability, not only remained confined to the ideational level, it affected the liberal *sanatani* Hindu more than it did the dalit. Equally, the Ambedkarite legacy which focused essentially on the secular realm – resources, education, jobs and power – remained limited. While the former worked tirelessly to retain the dalits within the Hindu fold, the latter came to believe, late in life, that the solution lay in opting out, in conversion. Neither icon seem to appreciate that the victimised dalit was a victim of the victimised Hindu.

Extant dalit politics continues to dismay the liberal outsider – the fractious wrangling, the intemperate speech, the unprincipled alliances, the persistence of a narrow dalit elite which seems to have cornered all benefits, in the process distancing itself from its moorings and thus unrepresentative. This is partly a reflection of the contradictory self-activity of historically downtrodden groups and communities who find the rules of upward mobility and acceptance altered every time they seem to be making a dent.

Equally, notwithstanding the wealth of anthropological detail – the different dalit castes and communities, their secular and religious condition – analysts continue to treat them, at least conceptually, as an undifferentiated mass, as if they stand outside history. There is a tendency to reduce the complex repertoire of struggles – the assertion for identity (both individual and collective), for respect and social justice, for equality and power, for self-worth – to just the contingent primary objective. It is as if their struggle is merely for reservations, for jobs, or for ritual acceptance.

This is evident even in the sympathetic rendering of dalits in creative literature. Bhairappa's *Ullanghan*, Giriraj Kishore's *Parishista*, or Mulk Raj Anand's *Coolie* rarely approach the raw power of Daya Pawar's *Balut* or the early Namdev Dhasal poetry. It seems that the voice of the troubled outsider cannot meet that of the enraged victim, a point made brilliantly by the late D.R. Nagaraj in his collection of essays, *The Flaming Feet*.

What then of the future of dalit politics as exemplified by the Kanshi Ram-Mayawati BSP, the different RPIS in Maharashtra, the many dalit senas, or the dalit parties in the South? Seeking upward mobility through the reservation route (education, employment, political) is a strategy that is likely to yield poorer results. For one, in the era of liberalisation and privatisation, state generated avenues are shrinking. The introduction of OBC reservations via the Mandal Commission has also pushed the courts into defining more stringent rules for governing reservations, both at the point of entry and for further promotions. Most important, it has generated hostility in the upper caste bloc.

Similarly, exclusivist dalit politics based on consolidating narrow caste loyalties to extract advantages and concessions from the state is also meeting increased resistance, both from within and without. At one plane is the retaliatory violence of the *savarnas*. At the other is the increasing difficulty of consolidating the dalit, MBC and OBC blocs, with specific castes and segments seeking individual routes and alliances. Since the dalits on their own rarely represent a viable electoral strength, more than winning seats, they, or rather their parties, have been reduced to becoming spoilers. A series of 'opportunistic' alliances viz. of the BSP with the BJP and Congress, and the overblown egos of the dalit and OBC leaders, seem to have put a crimp in the construction of a larger and inclusive bahun politics.

Finally the cultural assertion route, be it through celebrating Balmiki or Rabidas *jayantis*, constructing temples to dalit dieties, or remembering the rule of Bali Raja. They too have their limitations, particularly in terms of political power. So is the adoption of the nomenclature of indigenous peoples as a source of generating pride in their past and cultural traditions.

The road ahead is bumpy. Nevertheless, despite recurrent betrayal by the leadership, the process of dalit conscientisation continues. A combination of the above strategies alongside increased realisation among caste Hindus of the need for reform and tolerance has contributed to a pluralisation of the situation. The anxious effort of the Hindutva brigade to incorporate Ambedkar as part of their iconography is indicative. The coming millennium will witness an intensification of this social churning. Hopefully it will lead to a more humane future.

This issue of *Seminar* explores the different facets of the dalit situation.

# The politics of naming

GOPAL GURU

CATEGORIES in political explanation enjoy a life-span of their own. They travel alone along a path strewn with challenges and counter challenges, contradictions and their transcendence. That is why these categories and their labelling (naming) change meaning, connotation and significance overtime and overspace, depending on the politics of the users who create these categories. In other words, in the domain of politics, these categories do not acquire an arbitrary character. They are not aimless or passive representations of the world out there, but are conscious constructions encoding either a positive or negative agenda.

The current debate about categories, particularly one like dalit, undoubtedly signifies the suppressed and the exploited groups in various

social formations. But it also hinges upon whether a given category represents a monolithic historical reality or whether it refers to the multiple, polycentric, polyphonic and dynamic relations of life.

In contemporary politics, most explanations indicate a hierarchical use of categories – the assumption being that the conceptual space may only be occupied by a single dominant category or one set of categories. Such essentializing or freezing of categories creates a sort of 'patent', making a particular category an individual's property. This process of monopolization or commodification tends to locate these categories within the realm of the intentionality of any group or person, or their enemies. This freezing of categories, thus, tends to artificially place people in a box as a given category.

Moreover, this attempt at freezing a framework suggests that the categorization of a particular collectivity does not depend upon the concrete historical material role played by any relevant entity while taking on the forces of domination and hegemony.

The dalit political discourse in our country is marked by a contestation of categories that engaged dalit leaders who tried to float different political categories, either for radicalizing dalit politics or for countering the radical politics of the dalits. The category dalit, which has become a part of academic discourse both abroad and in the country, has also found expression across the socio-cultural spectrum.<sup>1</sup> However, it has come to be keenly debated, politicized, even condemned by certain quarters of the dalit community.

**F**or example, the category dalit has faced criticism, particularly by the urban, educated middle class dalits, as socially regressive, derogatory and hence undesirable.<sup>2</sup> These middle class dalits argue that this category forces dalits to carry the load of their historical past<sup>3</sup> and hence offers a socially reactionary agenda.<sup>4</sup> There are others who argue that the category shares the same reactionary agenda as

the one invoked by Manu, the Hindu law giver.<sup>5</sup> These opponents argue that the *ontological basis* of the category of dalit is class, which is undesirable.<sup>6</sup> Instead, they prefer to define the category on an individualistic basis and foreground the category Buddhist.<sup>7</sup> Ultimately, these attempts posit the category dalit in opposition to the category Buddhist.

**I**n recent years the term dalit has been discarded as a socially reactionary category by a section of the community who prefer bahun over both the Buddhist as well as dalit categories.<sup>8</sup> There are other efforts which do not run down the category as Buddhists and the bahujans do. Instead, they seek to define it primarily in terms of caste exploitation. For example, they define dalits as representing those who have been ground down by those above them in a deliberate manner.<sup>9</sup> This mode of understanding dalits also assumes that the category dalit implies an inherent denial of dignity, a sense of pollution within the framework of a theory of *karma*, justifying hierarchy.<sup>10</sup> All these attempts seek to define the dalit category negatively.

However, contrary to this denigration exercise by exponents favouring the use of bahun and Buddhist are consistent attempts by a few dalit

writers and ideologues who offer a radical definition. Baburao Bagul, who provided an ideological face to the Dalit Panther manifesto, promotes the use of dalit as a revolutionary category for its hermeneutic ability to recover the emancipatory potential of the historical past of dalit culture. He argues that this category has a greater capacity to reach out to a larger section of people. In Bagul's view this category is based on a materialist epistemology and is not a mere linguistic construction. On the contrary it is a category historically constructed through the revolutionary struggle of the dalits. And finally, as the Panther manifesto and Bagul spell out, this category is imbued with an ontological ability to identify itself with the lower castes, tribals, women and all the toiling masses in the country.<sup>11</sup>

**I**n the same vein, S.P. Punalekar offers another radical definition of dalit category. He claims that the term dalit is an intellectual construct aimed at decoding the subterranean, genuine and all-encompassing currents within society, meaning thereby the expression of the powerless and voiceless.<sup>12</sup> Thus, Punalekar provides a positive reading of the category dalit in a theory of politics which intends to foreground authentic thought and practice. Other scholars like Ghanshyam Shah, Gail Omvedt and Raosaheb Kasbe too define the dalit category more or less in a similar fashion.<sup>13</sup> However, scholars like Ashis Nandy treat the category dalit as a social construction of the

1. *Dalit Newsletter* is published from the USA by Dr. John Webstar, and besides the US it reaches parts of Europe. Moreover, the term dalit has become a part of universal academic discourse as one finds articles in various social science journals like *Social, Economic and Historical Review*, 1997. Even political leaders in India use this term frequently.

2. This is the general reaction that one comes across from the dalit middle class all over the country. They look at the term dalit with disdain.

3. The dalit middle class which is also criticised as the Dalit Brahmin expressed this reaction to the autobiography *Baluta* by the late Daya Pawar, one of the leading Dalit writers in the early 1980s in Maharashtra.

4. Bhausaheb Adsul (ed.), *Dr. Babasaheb Ambedkar – Preneche Sahitya* (Marathi),

13. See Ghanshyam Shah, *Social Movements in India*, Sage, 1988; Gail Omvedt, *Dalit and Democratic Revolution*, Sage, 1994, and Raosaheb Kasbe, *Dalit Movement in Maharashtra*, Keshav Gore Memorial Trust, Mumbai.

middle class which defines it in purely ascriptive terms. Nandy further argues that this construction ignores the cultural moorings that correspond to other dimensions like traditional crafts and skills of the dalit.<sup>14</sup>

Thus, the intellectual and political journey of the term dalit is complex. It is used in multiple ways, often in a contradictory fashion and therefore suggests a kind of conceptual hierarchy in its use. Other rival categories are so constructed that they provide little internal affinity with each other in terms of their political meaning and function, for example, the bahun and Buddhist categories.

**S**uch a privileging of any one category over others raises many issues. First, what is the historical trajectory of the dalit category? How is this category arrived at? Two, in the context of the ensuing debate, the category dalit involves a conceptual hierarchy which by definition implies that the conceptual space in the political explanation can be occupied by only one dominant category or a set of categories. In other words, does it involve any kind of homogenization of other categories? Or does it show a measure of tolerance and permit mutual coexistence with other categories belonging to the same logical class? Third, what is the future of these categories, particularly in the political domain? Will they be accepted by the different political forces in the country or are they destined to become untouchable?

In the historical journey, untouchables were characterized by the upper caste social reformers, particularly in Maharashtra, in a variety of ways. For example, S.M. Mate, a Brahmin social reformer in 19th century Maharashtra, used the term *asprutha* for dalits, meaning the

untouched rather than the untouchable.<sup>15</sup> V.R. Shinde, the Maratha social reformer, used depressed classes for dalits and thus located the term dalit in the imperial setting.<sup>16</sup> Most importantly, among the major efforts at naming dalits, Gandhi introduced the term harijan. Though different from the imperial setting, this was rejected by several sections of society.

It is interesting that the category dalit was first used by Ambedkar himself in his fortnightly *Bahishkruit Bharat*. He defined it comprehensively: 'Dalithood is a kind of life condition which characterizes the exploitation, suppression and marginalisation of dalits by the social, economic, cultural and political domination of the upper caste brahminical order.'<sup>17</sup> Ambedkar, however, did not use this category often, preferring to deploy different terms depending upon the changing context. For example, when dealing with the imperial state he used the category of depressed classes.<sup>18</sup> When addressing high caste Hindus he used the category *bahishkruit* meaning totally outcaste.<sup>19</sup>

**I**n the arena of competitive politics, he preferred the term 'scheduled caste'. It was evident when he used this term for establishing the political party, Scheduled Caste Federation. However, he also tried to provide a class identity to the dalits during the late 1940s.<sup>20</sup> Finally, in an effort to

politically radicalize his own social constituency, he used the term *pad dalit*, meaning those who are crushed under the feet of the Hindu social order.<sup>21</sup> In more recent years the category dalit was first comprehensively deployed by the Panthers, thereby combining the caste, class and gender dimensions which were also part of Ambedkar's mode of thinking and his revolutionary politics.

**L**et us now examine these in relation to categories from the opposite setting. The category of harijan cannot be encapsulated within the dalit category since it is entirely 'metaphysical'. It imputes an element of 'resigned fate' to the subject and therefore can render it inactive. Second, the term harijan is an ascribed one since it does not flow from the untouchables own experiences. It was artificially imposed on the untouchables by Gandhi and those upper caste people who could not genuinely integrate them within their social consciousness despite its divine association. Overall, the category of harijan lacks a discursive capacity.

In contrast, the category dalit is not a metaphysical construction. It derives its epistemic and political strength from the material social experience of the community. It is this social construction of dalithood which makes it authentic and dynamic rather than passive and rigid. Hence, the term dalit, in Gail Omvedt's opinion, provides a militant alternative to the Gandhian term harijan.<sup>22</sup> Finally, the category harijan, given its divine association, is inadequate for capturing the

specific realities since it also replaces the need for internal critique.

The category dalit needs to be distinguished from the terms 'backward and forward'. It does not entertain such binary opposition because such binaries assume backwardness as a given in order to legitimize its distinction from forward. To state it more sharply, the category 'forward' logically feeds on the presence of the 'backward' and is sustained by it. Other binaries like privileged and underprivileged are unsuitable for the same normative considerations which are aimed at transcending all the constructs that underlie and renew the structures of inequality and exploitation.

**T**hese binary categories represent a minimal and at times negative agenda in the political sphere. They connote a negative utopia because they are primarily anchored within bourgeois structures embedded in the consciousness of possessive individualism which is basically self-limiting in terms of facilitating collective transformative political action. In other words, the category dalit, unlike harijan or the others, does not derive its substance from the politics of patronage or rhetorical concessions that liberal politics tend to offer to dalits and other toiling masses. Thus, the term dalit has a subversive potential which emanates from a realization of the limitations of the symbolic success which is the essence of bourgeois ideology.

The category dalit is also distanced from state constituted categories like scheduled caste, scheduled tribe and OBC. On the surface these categories, which are a legal construction by the state, appear innocent and at times secular. However, when understood in the context of their function they become a deliberate and therefore an artificial construction by

the state. These state constituted categories have a three-fold function.

First, they enable the state to trap the SCs into 'juridification' which in effect subordinates more and more SCs to the structures of spoil and patronage controlled by the state. Attempts to access these structures of paternalism reconstitute the SCs as the repository of a dole receiving mentality and charity rather than parity. Yet, at another level, these state constituted categories also acquire the status of a statistical entity which is then used by the state for *ad hoc* planning rather than for theoretical treatment of the social situation into which these categories are rooted.

Two, these categories, created by the state in the name of social planning, trap the SCs into a kind of 'domestic discourse' which in effect dilutes their creative energies by making them either official intellectuals who are ever ready to provide advice to the state, or power brokers with a vested interest in the perpetuation of the hierarchies in power structures. Thus the SCs, as constituted by the state, become the repository of malignant rather than benign power.

**F**inally, through creating such categories the state promotes the myth of sponsored individual mobility and initiative. This dampens the possibility of creating an autonomous political identity and a discursive space which might help the SCs constitute a collective context to find solutions to their own substantive problems outside the state framework or even to interrogate this very framework. The state constituted categories are patronizing and hence acquire an ascriptive status like the category of harijan or asprutha.

The category dalit emerged primarily in opposition to this 'domesticating discourse' in the early 1970s viz. the emergence of the Dalit Pan-

thers. The category dalit, therefore, seeks a political mutilation of these state constituted categories. Through its negative hermeneutic it resists any provisional achievement in the process of human emancipation. Possibly for this reason, Omvedt describes the state constituted categories as colourless.<sup>23</sup>

**T**he category of dalit also resists being drawn into a simplistic division between the majority and minority or the bahun and mahajan dichotomy floated by certain bahun leaders. It distances itself from these categories for two reasons. First, it does not perceive people as a statistical entity to be manipulated by the dalit-bahun power brokers or 'poll pundits'. This category does not exist *a priori*, either for computing or for electoral arithmetic, but has to be discursively constituted across the social and ideological spaces through constant and sincere negotiation with other vibrant and sensitive categories and their supportive ideological frameworks. For this reason the category is just not available for chicanery, political manipulation or calculation by any internal or external forces. Thus, the category of dalit has a potential to undermine the pragmatist politics (*realpolitik*) of the opportunist, both from the dalit community and outside it.

We now address the issue raised by Ashis Nandy who considers the category dalit as a social construction of the middle class. The category dalit is clearly not a middle class construction. If anything, its interrogation of the state constituted categories should answer Nandy's query. He claims that the category dalit is blind about its cultural context. He does not realise that the term dalit does not arise from a mechanical movement through the

23. Ibid.

highways of politics. Instead, it arises from the bylanes of critical cultural traditions such as the Buddhist, Warkari and Kabir.<sup>24</sup> But unlike Nandy, the term does not privilege the cultural over others; if anything it seeks to locate the cultural in the context of power structures that have a bearing on culture. It interrogates the structures of social and material hierarchies that sustain a particular cultural ethos. Thus, the category dalit is not one dimensional but is sensitive to its other anchorages.

Finally, we need to query the ontological relationship of the term dalit with categories like bahujan, Buddhist, class or subaltern. In other words, are all these categories mutually hostile to each other? The answer, much to the disappointment of the politicians from the lower and the upper castes is in the negative. These categories belong to the same logical class in as much as they share the same positive utopia of creating a society free from coercion, exploitation and thus, dehumanization of people. For example, how can the category Buddhist be in opposition to dalit or dalit in opposition to subaltern, class and bahujan when all encode the promise to engage the toiling masses into the radicalization of politics necessary for challenging the forces of hegemony.

The accommodation of these categories into an emancipatory project is not out of convenience; it has authenticity in as much as all these categories confront various structures of domination and exploitation. To conclude, the category dalit provides both an element of negation (to state constituted categories or harijan) and permits the conjunction of categories belonging to the same logical class (Buddhist, bahujan).

# Dalit interpretations of society

RAMESH KAMBLE

INDIAN society has been exposed to various socio-economic changes and legal initiatives over the last 200 years. Factors such as colonialism, capitalism, and later Indian Independence, with the Constitution espousing democratic governance and legal provisions including the policy of positive discrimination, have all effected important changes in the social fabric and economic structure of Indian society.

Despite these changes, 'the Indian experience of social and economic status reflects the Brahminical hierarchies as much or more than the colonial or material hierarchies.'<sup>1</sup> Hence, the transition from 'caste' to 'class' continues to remain an unfinished and problematic agenda. This is more so in the case of dalits; though in a few cases the class status has changed, their social experience continues to be primarily dictated by their caste status. Nevertheless there have been changes. Apart from various state initiated efforts, the dalits themselves have revolted against the caste system and their lowly designation, and have struggled to reconstruct Indian society on the principles of justice, equality, liberty and fraternity. However, these efforts have not rendered traditional social customs, beliefs, values and practices irrelevant.

A recent anthropological inquiry by Mayer into changes in the north Indian village shows that caste dis-

tinctions are very much observed in the village society. Though the significance of certain indicators of caste rank, such as acceptance of food from the other castes and formation of *pangat* (line of eating in village functions) have undergone some change, notions such as *khan-pan* (food and drink, meaning general domestic condition of caste) or *rahen-sahe*n (ways of life) have, under the changed conditions, become new markers of caste distinctions.<sup>2</sup>

If caste distinctions continue to be observed among the 'upper' and 'lower' castes, the situation in the social and economic conditions of dalits and the 'lowest touchable caste' ('on the verge of pollution line' as Deliege puts it), is not dissimilar. Deliege's study of a south Indian village exhibits that though the social and economic conditions of pallars (SCs) and valaiyars (lowest touchable caste) is identical, the economic position of pallars is in fact slightly better. The pallars' residential areas continue to be called *cheri* (untouchable ghetto), whereas that of valaiyars are called *ur* (village). The caste distinction between these two communities is reiterated through the vannans' (washermen) claim that they wash clothes of 'high castes only'.<sup>3</sup> If such has been the experience in village

2. A. Mayer, 'Caste in an Indian Village: Change and Continuity, 1954-1992', in C.J. Fuller (ed.), *Caste Today*, Oxford University Press, New Delhi, 1997, p. 59.

3. Robert Deliege, 'At the Threshold of Untouchability: Pallars and Valaiyars in a

society, the condition in the cities too is no different. My study of dalit social experience in the urban setting of Mumbai shows that the social discrimination and economic exploitation they face has not changed. Rather, it has assumed different forms.<sup>4</sup>

**T**here are other inquiries which suggest that in contemporary times castes have not remained what they 'were', i.e., they are also constructed in a number of other ways—through formation of caste based associations for educational and economic advancement or marriage requirements. Consequently, castes will need to be seen as 'both something people "do" and/or something they "are".'<sup>5</sup> Thus, there is competition for social, economic and political spaces through caste networks. For dalits, however, who have largely remained outside the margins of development and continue to experience oppression, 'the experience of caste is not so much what you "do" as something which is "done to you" by the upper castes.'<sup>6</sup>

Given this background, of '(greater) continuity and (limited) change', an inquiry into the following interrelated questions would be pertinent. First, as a result of social awakening among them, how have dalits contested the upper castes' 'definitions' of their social status? In other words, how have dalits attempted to 'redefine' their social position vis-à-vis the upper castes' imposed defini-

tions of their condition? Second, if caste-based hierarchies persistently dictate their social and economic status, how do dalits view Indian society? Do these visions exhibit an overall commonality or diversity? Third, what has happened to the dalit goal of 'annihilation of castes' in India? Do they perceive the caste system as an irrevocable reality in India? Or do they think that despite the seemingly bleak possibilities for 'annihilating' the caste system, it is still necessary to pursue the struggle to end it?

**B**efore plunging into a discussion on these issues it would be appropriate to begin with the main approaches advanced to understand the dalit situation. In his study of an untouchable community in south India, Michael Moffatt argues that though treated as low in the Indian caste system, untouchables do not necessarily possess different social and cultural forms, nor do they possess a separate sub-culture. 'The "view from the bottom" is based on the same principles and evaluations as the "view from the middle" or the "view from the top". The cultural system of Indian untouchables does not distinctively question or revalue the dominant social order. Rather, it continuously recreates among untouchables a microcosm of the larger system.'<sup>7</sup>

Gerald Berreman, on the other hand, argues that low caste people 'laugh at upper caste claims of superiority.' They do not accept the unclean and demeaning status assigned to them. 'They have diverse notions of their own as to how and why the caste system developed, most of which refer to the superior power of the high caste rather than superior purity. They have

no option however but to defer to local high caste persons unless they wish to be beaten or deprived of their livelihood.'<sup>8</sup> Of course, despite the risk of being beaten or deprived of their livelihood, the dalits have, as many contemporary instances show, chosen to reject deference to the high castes.

The third approach which attempts to understand the untouchables' situation is exemplified by James Freeman's sensitive life history of the Bauris in Orissa. Freeman observes that the 'untouchables reveal a great diversity of responses to oppression.' The life history of the Bauris suggest a process of both 'an accommodation to or rebellion against' their oppression by the high castes.<sup>9</sup>

**T**hus, we have three main approaches which point to three different explanations of dalit orientations: (a) culturally, untouchables form a part of cultural order of the upper castes; (b) untouchables reject their inferior designation by the high castes and question upper caste notions of superiority, and if they accept high castes' superiority, it is not because of the intrinsic superiority but the superior power of the high castes; and (c) untouchables show both 'resentment against and compromise with' the high castes' domination. I would venture to suggest that dalit attempts at redefining their social status in contemporary times should be seen as a fluid combination of the above perspectives.

Though there appears to be a greater continuity and little change in the social and cultural framework of

Indian society, dalits have attempted to redefine themselves since the 1920s. The changed socio-economic structure under the British Raj provided the context for the dalits' ideological rejection of Brahminism and even Hinduism. Thus, as Gail Omvedt observes, by the 1920s there were many *adi* movements with an ideological claim to being of a 'non-Aryan' or original Indian; an equalitarian tradition began to take off in many regions of India.<sup>10</sup> In Andhra, the Adi-Andhra Mahajan Sabha claimed that the so called *panchammas* were the 'original sons of the soil and were rulers of the country.'<sup>11</sup>

In Uttar Pradesh, urban occupational experience for untouchable groups like the Mehtars, Bhangis, Chamars and Doms, created a context for the revival of the Bhakti movement and an ideological assertion of being adi-Hindus which became a source of denying caste distinctions and questioning discrimination. Through these means the untouchables argued that 'bhakti was the religion of the original inhabitants and rulers of India, the "adi" Hindus, from whom the untouchables have descended.'<sup>12</sup> That 'the Aryans conquered the original population by deceit and manipulations... those who ardently believed in equality were ranked, and ranked lowest.'<sup>13</sup> Similarly, Punjab too saw the formation of an adi-Dharam movement, proclaiming the untouchables as a separate community.

10. Gail Omvedt, *Dalit Visions*, Orient Longman, New Delhi, 1995, p. 34.

11. Ibid.

12. Nandini Gooptu, 'Caste and Labour: Untouchable Social Movements in Urban Uttar Pradesh in the Early Twentieth Century', in Peter Robb (ed.), *Dalit Movements and Meanings of Labour in India*, Oxford University Press, New Delhi, 1993, p. 284.

13. Gail Omvedt, op. cit., p. 38.

These ideologies of difference were, however, racial in nature, i.e., they viewed the difference between the touchables and the untouchables in racial terms, as Aryans and non-Aryans.<sup>14</sup> Ambedkar, however, rejected these ideologies by pointing out that there was no racial affinity between the Brahmins of Punjab and the Brahmins of Madras, that the Brahmin of Punjab was racially of the same stock as the Chamar of Punjab. Hence 'the caste system does not demarcate racial division.'<sup>15</sup> Thus, instead of referring to untouchables in *adi* terms, Ambedkar viewed them as 'broken men'. And instead of the racial approach, he stressed the civilizational conflict in India between Hinduism and Buddhism, the former representing inegalitarianism and oppression, and the latter an advanced egalitarian formation.<sup>16</sup>

Apart from these ideological/religious constructions in the initial phase, dalit struggles in later years came to be centred more on achieving social, economic and political rights as a source of emancipation. Further, in this pursuit dalits have also attempted to forge a larger unity of the marginalized sections in India. Thus, Ambedkar's Independent Labour Party was a step towards forging the larger unity of the oppressed, the working class and peasantry to fight Brahminism and capitalism. Later, through the all India struggle of the landless in 1957 and the Dalit Panther movement, dalit politics exhibited radical emancipatory leanings aimed at structural transformations. However, these did not materialize in concrete political terms. Thus, instead of a large united struggle of the

14. Ibid.

15. Quoted in Gail Omvedt, *ibid.*, p. 49.

16. Ibid.

oppressed masses, one witnessed a scattered and sporadic nature of dalit struggle in India.

Though the processes of socio-economic change in independent India have not altered the dalits' experiences of exploitation and oppression, it has nevertheless effectuated changes in some of their lives. Apart from creating the context for a sense of awakening, in questioning the caste system and even rejecting Hinduism among dalits, these changes have also created conditions for their co-option. Though the spread of education and government employment has made dalits more aware of their plight, it is through these processes of social mobility that some dalit communities have begun to visualize themselves, not as separate from the Hindu community, but as a part of it.

Bernard Cohn's study of Chamars in Sawai Madhopur is a case in point. Cohn pointed out that with education came a change in family structure, domestic ceremonies and religious life of Chamars in Madhopur which showed greater affinity to orthodox Hinduism. With the aim of raising their caste social status this community made a common effort to suppress their distinctive traditional religion. Their domestic ceremonies, such as at the time of naming and marriage, came to resemble Brahmin ceremonies.<sup>17</sup> Further, for the Jaiswara Chamars the changes also meant outlawing beef eating and the wearing of sacred thread, and a construction of themselves as 'Harijan Thakurs'.<sup>18</sup>

Of course, unlike this attempt of claiming a superior status within the Hindu framework, Lynch's study of

17. Bernard Cohn, *An Anthropologist Among the Historians and Other Essays*, Oxford University Press, New Delhi, 1987, p. 272, 280.

18. Ibid., p. 279.

the Jatavs of Agra shows that the urban experience and consequent social mobility created the context for this group's rejection of not only the caste system but even Hinduism.<sup>19</sup> Thus, with processes of social mobility and change, dalit perceptions of self and society have assumed a more complex character. Perhaps the diversities and complexities of dalit perceptions of Indian society could be better grasped if viewed in the light of the specific experience from Maharashtra.

**M**aharashtra has been the site of the most radical dalit assertions. From the turn of the present century, dalits here have shown signs of awakening and protest. However, from the 1920s onwards, dalit struggles assumed a more decisive character. Under the leadership of B.R. Ambedkar, the denial of basic rights to dalits became an *issue* in Indian politics. Of course, apart from campaigning against multi-pronged slavery of dalits, the movement also attempted to address the larger issues of exploitation and oppression suffered by the working class and peasantry. Such an orientation was present even in the post-Ambedkar phase of the dalit movement, notably in the nationwide *satyagraha* of the landless masses in 1957 and later during the Dalit Panther movement.

However, in addition to campaigning against socio-economic slavery, the dalits desired a life with human dignity and self respect. This, they were convinced, was not possible while remaining within the Hindu fold. Hence, on 14 October 1956, there was an exodus of dalits to Buddhism. Of course, even prior to this incident, some sections of the dalit community in

Maharashtra had converted to Christianity in the hope of achieving human dignity and personal well-being.

**T**hough the Ambedkar movement was largely supported by the Mahars, other major dalit groups in the state – Matangs and Chambhars – also joined it at some time or the other. The Chambhars participated in the dalit movement during the '20s and '30s. However, later, under the influence of the Gandhian politics of 'integration' they parted ways. The Matangs' participation in the dalit movement was more pronounced during the '70s and '80s, notably in the Dalit Panther movement and also in the *namantar andolan* (agitation for the renaming of Marathwada University). However, both these groups have largely stayed away from conversion to Buddhism.

The continuation of Chambhars within the Hindu fold in an attempt to get better treatment and the Matangs' indifference to conversion to Buddhism created rifts among the dalits in Maharashtra. The Mahars, who see their embracing of Buddhism as a rejection of Hinduism and a march towards a more egalitarian and humane culture, view these groups as lacking in consciousness. Hence, one notices different perceptions of Indian society among these groups.

In order to raise their caste status, the Chambhars have, through social mobility, made attempts to sanskritize their domestic and religious ceremonies. The better placed among them emulate the lifestyles of Brahmins, whereas the less educated show enthusiasm in observing Hindu festivals. This orientation has created grounds for their absorption into *Hindutva* politics and its agenda of building a *Hindu Rashtra*. Even Matangs, though following their traditional religious practices, i.e. the worship of deities such as Khandoba

and Ambadevi, and some among them laying claims to Dravidian culture, are not totally free from Hindu influences. Further, in order to gain political power they too think that the politics of *Hindutva* could be a vehicle. Indeed, the Chambhars and Matangs who joined *Hindutva* politics have been rewarded with seats in the legislature and some ministerial berths. However, this has not resulted in an end to socio-economic slavery for the majority, nor has it helped end caste discrimination. Rather, it has only resulted in their distancing from dalit struggles even further.

**T**he Mahars' conversion to Buddhism in 1956 made them reject the low status imposed on them and intensify their march towards dignity. Moreover, it made them staunch critics and opponents of Hindu culture and politics. However, the unfolding of the Buddhist identity during the last 40 years suggests that in their everyday life and cultural practices the Buddhists, as yet, do not show any radical departure from the traditional Indian (read Hindu) worldview. Indeed, their domestic and religious ceremonies indicate the observance of new, simplified and abbreviated rites (as opposed elaborate, lengthy, sanskritized Brahminic rites).

Moreover, Buddhism, at least for the less educated, remains ritualistically centred. In the case of the better placed among them it reveals both a formation of secular, 'this worldly' identity, and also an orientation towards achieving the purity of mind from evil forces. This latter view – stress on the mind – of Buddhism among some of the better-off, presents a dangerous orientation since it locates the source of problems *within*, as opposed to the caste discrimination and socio-economic oppression experienced from the *outside*. Instead of

fighting to end slavery experienced from the outside, the central preoccupation, thus, becomes a fight to guard the mind from evil influences.

**I**t is necessary to note here that this orientation is a departure from the conception of Buddhism espoused by Ambedkar in his work, *The Buddha and His Dhamma*. Ambedkar's interpretation of Buddhism suggests that he viewed it primarily as a social ideology, aimed at ushering social emancipation in the lives of those condemned to slavery and robbed of basic humanity. In his conception, by embracing Buddhism, dalits would not only arrive at a new desirable identity, but would receive a right to independent critical thinking which they were denied under the Hindu caste system. Above all, Ambedkar's reading of Buddha's dhamma had its roots in Buddha's social message: justice, love, liberty, equality and fraternity.

Identity constructions and formation of worldviews are not devoid of the specific contexts of socio-economic conditions people are enmeshed into. Hence, dalit identity constructions and formation of their worldviews should also be seen in the light of their socio-economic experience. Because of their migration to an urban centre (Mumbai) and the consequent social awakening and struggle, dalits in Maharashtra have achieved social mobility, mainly in terms of education and employment in government services and the organized sector. Thus, during the '60s, '70s and '80s, dalits were absorbed into governmental employment and semi-government services. However, in present times they are being ousted from their positions. The policy of liberalization has rendered the policy of reservation redundant. Likewise, their access to employment in other organized sectors has shrunk drastically.

Thus, the dalits are experiencing new conditions of marginalization and subordination. The commonly experienced marginalization, however, has not become a ground for unity. Instead of questioning the state and other exploitative and oppressive forces of caste society, they perceive each other as a cause of their marginalization. The Matangs' claim 'that more than the upper castes, the Buddhists are our greater adversaries, as they have monopolized all sources of development'; that, 'we should be given a separate quota within the reservation quotas', are demands which make little sense if seen in the light of the policy of liberalization and privatization.

**W**hereas the Chambhars have exhibited greater allegiance to Hindutva and distanced themselves from dalit politics and movement, the Buddhists, though showing firm resistance to atrocities they experience (as the Ramabai Nagar incident indicates), express their resistance to Hindutva politics through the ballot box (as the last Lok Sabha and state assembly election results show). This resistance lacks awareness of an agenda for structural transformation. This variation in dalit orientation has implications for their goal of 'annihilation of castes' in India.

With experiences of marginalization and an inability to transform the structures which reiterate the enslaving experience, dalits do not exhibit a common perception but necessarily multiple, complex reactions. Instead of creating a context for dissolving caste differences from within, the commonly experienced marginalization of dalits has prepared the ground for an intensification of caste consciousness among them. Thus, if the Chambhars feel that the 'end of caste is possible only through

development of (our) caste', for the Matangs too 'developing our caste' has become a major concern. This aim, they feel, could be accomplished not through a rejection of Hindutva politics but by making use of it for political empowerment. Even among Buddhists (though they resolutely oppose Hindutva) the view that, 'if caste system presents an irrevocable reality in India'; 'if we have to remain the sole opponents of upper caste dominance; there is no other way but to think about "our" development,' has started gaining ground.

**D**oes this mean that dalits have given up their goal of annihilating caste? Perhaps it would be wrong to come to such a conclusion. For, with the ascendance of the ideology and politics of Hindutva, dalits are attempting to forge broader ideological and political alliances with other oppressed groups. Thus, an ideological construction such as *bahujanwad*, involving the unity of dalits, OBCs and other marginalized sections, is envisaged. However, to the extent that these strategies have succeeded, they have remained limited to political accomplishments alone. Even in these (as the SP-BSP experience show) there are more perils than promises. For, the political awakening among the OBCs and their quest for political power does not necessarily make them allies of dalits in working towards the 'annihilation of caste'.

Indeed, in recent times there have been attempts to radicalize the content of the category 'dalit'. It envisages a broader unity of all the oppressed – dalits, tribals, OBCs, the working class, peasantry and women – in ending subjugation, oppression and exploitation in Indian society. Of course, it is to be seen how far this radical ideological content is translated into common concrete action.

# Transforming dalit politics

A GAJENDRAN

The dalit movement has finally come to be recognised as having a potential to demystify the Indian nation-state. Its varied political configuration has, wittingly or unwittingly, catered to diverse social assumptions about the very nomenclature, composition, reach and above all its ideology, especially by the caste Hindus.

Most upper castes 'imagine' dalit (i.e., people derogatorily called SCs and harijans, both in British and independent India) as a category of exclusivism/sectarianism marked by a vindictiveness against caste Hindus. Surprisingly the dalits too share such an imagination as an easier option, particularly given the escalating caste Hindu intransigence. This essay attempts to understand, both at the theoretical and electoral political level, and situate the diverse imaginations and praxis of the binary of the 'self' (dalits) and the 'other' (caste Hindus) in perspective. The location of dalits and the caste Hindus as a binary cannot be adequately analysed without problematising their historicity and historiography as vital antecedents.

When one explores the historicity of dalits, their ethno-linguistic het-

erogeneity is manifested in all their socio-cultural features—festivals, religion, music, dance, food habits, medicine system and so on. However, a point to be noted is that traditionally many dalit communities seem to have accepted Buddhist values and incorporated them in their respective regional cultural features, thereby challenging the conventional understanding of a homogenised process which uprooted all dalit communities from their cultural milieu and accommodated them within a sub-continental boundary called Hindu India. This historicity is validated by the increasing archaeological evidence from Buddhist sites of different centuries which reflect dalit culture, as well as by the Buddhist dalit movements of the past centuries which have left behind the currently more privileged textual records.

The dalit cultural traditions and religious interpretations increasingly reveal their rational and non-dogmatic approach to material and religious life. Despite caste based persecution, they seem to have retained 'modernity' in their productive processes and worldviews. One sees this in their ingenuity in food production/agricul-

ture, craftsmanship/artisanship, medicinal practices, gastronomy, and above all literary excellence, especially when confronting the recent history of caste Hindu made calamities.

The above dalit historicity which views dalits not as 'objects' but as 'subjects' and its 'authenticity' could be brushed aside by a naive reader when one deploys the 'imposed historicity' of the 'other' to evaluate the 'self' i.e., 'dalit historicity'. This imposed historicity forces us to view dalits only within Hindu homogeneity and not beyond; it imagines dalits as a 'subordinated' category at the sub-continental level, especially after the arrival of the British and the freedom movement. The process of dalits negotiating with Buddhism, Islam and Christianity in different periods of history for their own liberal societal interests 'untouched' by Hinduism, as well as their attempts to ward off the latter's proselytization through the bhakti movement, becomes unhistorical in a framework conditioned by Hinduised historicity. Such a fundamental cultural divide between the dalits and the caste Hindus prevents the recovery of the 'self' *vis-à-vis* its emasculation by 'the other'.

**T**his 'negative' historicity of the dalits was reinforced as 'authentic' by the academia – Indian and European – from the British period onwards. Those who studied Sanskrit and hence Hindu scriptures, 'constructed' a paradigm which privileged the caste Hindus, enabling thereby the dehistoricisation of other communities, especially the dalits. The 'myths' of the Hindu scriptures, i.e. of the other, were taken as 'realistic' to undermine the 'myths' of the dalits, i.e. self, as 'unrealistic'.

The reinforcement of the roots of the caste Hindu centric *Akhand Bharat* can be traced to the legitimacy

accorded to it by European scholars. In this exercise the 'voice' of the dalit communities was 'mouthed' by caste Hindus, especially the Brahmins, as they were privileged as the 'most knowledgeable'. Empirical studies were carried out to reinforce the status quo, that is for 'privileging' a particular historiography.

The fallout of constructing such a dominant history led to a distortion of other disciplines as well, especially sociology, in a manner so as to 'subordinate or foreclose' certain cultures in order to 'foreground' a particular culture, viz. the use of conceptual paradigms such as great and little traditions, sanskritization, harijanization and so on. Evidently it was convenient for both the Europeans and the caste Hindus to stabilize their respective privileged positions through such exercises.

**F**or all these reasons, any source that valorizes India with its excellence in *gurukul* education and knowledges of different kinds, especially philosophy, as an uninterrupted sub continental homogeneity, remains suspect as a construction of 'the other' to the dispossession of 'the self'. This 'domestic colonization' of the academia stretched from the pre-colonial to post-colonial 'histories' of India.

The emergence of the subaltern school, especially in Indian academia, raised hopes about recovering the subordinated cultures of the sub continent. However, as Rosalind O'Hanlon has cautioned, many of the writings could not recover the dalits as 'subjects'; they were retained as 'objects' reflecting the 'pitying images' of the subaltern specialists within a homogeneous paradigm, rather than provide an appreciation of alternative heterogeneous cultural existence in the sub-continent.

The present day dalit politics cannot be understood in its entirety

if the aforesaid underpinnings are ignored. Historical sociology reveals the permanent dialectic between dalits and caste Hindus, of course, with the latter projecting an enduring success story of subjugating the former. But the unfolding myriad dalit ideologies and movements seem to point towards an essentially 'transformatory' philosophy which is 'liberatory' not merely of the 'self' but of the 'other' as well.

There are adequate reasons, currently, such as the caste Hindus celebrating the 50th year of their independence with the Jehanabad killings of dalits; the media, controlled by caste Hindus, ridiculing the demands and politics of the dalits through cartoons and headlines; the present political structure continuing to favour caste Hindus for political and administrative positions against dalits and so on, for dalits to react with as 'exclusivist' an ideology as their tormentors hold. However, the essence of dalit political moorings point to something different.

**T**he invention of categories such as bahun or dalit-bahun, usher in the plausibility of a progressive agenda of transforming Indian society as a whole (including dalits). So far the political processes in the sub continent, at least in the modern period, have sustained a political structure favouring the top rungs of the Hindu social order despite pretensions of adopting diverse ideological orientations. In such a setting the category bahun sought to upset the applecart of pro-caste Hindu politics. It actualised in electoral politics what Phule began in 19th century Maharashtra as a social reform movement and what Ambedkar contemplated in his political experiments of the 1940s.

While accepting the prevalence of a caste order it sought to subvert the benefits accruing perpetually to the

top rungs by uniting the lower rungs. It aimed to conscientise the non-caste Hindus, subsumed within the Hindu social structure degradingly as backwards, scheduled castes or adivasis, into a conglomeration of the 'sufferers', hence advocating the need to come together. The mere numerical strength of these victims, *per se*, was sought to be made use of to question the predominance of a minuscule minority like the Brahmins. Nevertheless, questions regarding the culture of the subordinated majority within the Hindu order were not problematised though the category was sensitive to the oppressions of other religious-cultural moorings by the caste structure. Hence it advocated unification with all victims of casteism;

**T**he category's prime focus was to point out the marginalisation of the majority by the minority caste Hindu groups. The present condition was sought to be changed through electoral politics which would empower the victims to restructure the socio-economic order favouring the *savarnas*, as the bahunas would reign. Despite its scathing indictment of the casteists, however, the bahunan category provided the space for the 'reformed' among the caste Hindus not merely to participate but also to represent the victims' cause of dismantling the caste structure.

The fact that post-colonial India experienced this unprecedented successful assertion by dalits, that too electorally through the bahunan category, affirms its intellectual understanding of transforming not merely itself but also the BCs, adivasis and other religious groups, as also the *savarnas* who realize their predicament. The accusation that it is sectarian appears to be merely an interpretation of those intellectual and electoral forces which are now being exposed

for their agenda of marginalisation, which feared even the mere arresting of caste-based age old socio-economic privileges as retribution, which supported a political category that would not disturb the present beneficiaries of the caste structure but would support a status quo.

**I**f the assurance of creating a space for dignity and prosperity to groups such as dalits can be betrayed by a mere installation of democratic institutions, even without Indian society undoing its undemocratic caste structure which determines the distributive mechanisms, that is in itself transformatory. If the dalits can ally with the backwards and other religious groups who have been victims of Hindutva under the umbrella of bahunan, we may witness a major transformation in India's political economy.

Even if the transformative capability of the category is limited to upsetting a few privileged castes, it is sufficient to prove its pathbreaking nature. For, the category creates avenues for those marginalised to share the political space, unseen so far by the diverse movements, including the much celebrated national movement.

The term dalit-bahunas represents yet another category with transformative significance. While it recognizes all the foundations of the bahunan category, it emphasises two important aspects: one, it supports the progressive logic that the most marginalised should be given the leadership of the movement. It highlights the role of the caste Hindu leadership, especially the Brahmins from the 'rightists' to the 'radical leftists', in perpetuating caste. Therefore, it foregrounds dalits among the bahunas of diverse marginalised castes and religious groups as those who have suffered most.

Second, as against the stranglehold of Hinduisation of the economy and hence politics, it counter-argues for 'dalitisation', i.e. incorporating gender parity, dignity of labour, horizontal division of labour, heterodox interpretation of socio-religious values, the understanding and practice of gastronomic practices such as beef eating and pork eating to undo the politics of vegetarianism, and so on. Instead of accepting an iron curtain it calls for caste Hindus to shed their inhuman existence and assume 'subject positions' within the humane values of the marginalised cultures. Therefore, any sectarian organisation of dalit-bahunas is antithetical to the very principles of this category. Rather, it provides a chance for the aggressors to redeem themselves.

**T**he philosophical worthiness of the aforesaid categories as 'inclusive' is yet to be realized in its totality by Indian society, especially in juxtaposition to the 'exclusive' unworthiness of the dominant paradigm and its politics. Such a realization is enormously hampered by the guilt and deprivation oriented paranoia of the privileged groups, now facing the agenda of transformation because of the revolutionary awakening among the masses against a casteist social structure.

This paranoia is perceptible, be it in a lay caste Hindu or an intellectual. It is further aggravated because dalits prescribe not merely an alternative transformative paradigm but also the assumption of leadership. To ward off such threats to the status quo, the caste Hindus seem to have dismissed 'all such efforts' by the marginalised as sectarian. Or patronisingly; considered them a disturbance by the fragments, the fringes which need to be assuaged by sharing 'assurances' of a slightly bigger slice.

Even though the invention of categories such as bahujans, dalit-bahujans and so on, have paradigmatic significance at the sub-continental level, nevertheless, the emergence of transformative categories, first, from outside the caste structure and second, through excavating the dehistoricised past, hence the present and future of the marginalised communities, seems more likely at the diverse regional levels. This implies that there is a need to recognize the diversity of marginalised groups such as dalits, as determined by their 'ethno-cultural niches'.

**T**he fact that India is yet to witness a homogeneous dalit movement, which would not merely assure electoral victory but also cultural renaissance of every dalit community, merits introspection. Those most prone to fantasize a monoculture of the subcontinent are the caste Hindus. Their political formulation received its severest beating with the collapse of the Congress party, notwithstanding its appeal to diverse cultures, especially dalits. The bubble of the BJP (doing what the Congress did in a camouflaged manner, i.e. its Hindutva project), is bound to be burst by none other than their victims—dalits—in the future, if not now.

Because the dalit categories appear most capable of raising questions about the caste edifice of Hinduism itself, they problematise the romantic agenda of delegitimizing the caste structure through secularism. Unfortunately, being oblivious to such realities makes the dalits pursue either an all-India politics with merely immediate electoral calculations since they are not backed by a positive homogeneous cultural discourse, or resort to 'constructing' a 'mono-dalit cultural discourse' subcontinentally. Either way, the possibility of dalits

succeeding in their long term political interests seems a far cry.

Had the undoing of the caste structure been possible merely through objective electoral politics, it would not have been as daunting as it is. Rather, we face a cultural manifestation influencing and gaining legitimacy, even through the electoral process. The caste Hindus engage in propagandising cultural symbols such as Ram, Ramayana or Mahabharata, which are then galvanized in electoral politics through *rath yatras*, through claims that these symbols are descendants of a history and subcontinental culture to manipulate the electorate. The electoral victory, in turn, is used to perpetuate such a 'memory' through politics, especially education. Of course, such a Hinduisation of the subcontinent is challenged as a recent fantasy. Hence the electoral reversal of the BJP, which is and will continue to be seen, as an organization of caste Hindu forces.

**I**f influencing electoral politics through cultural variables is a truism then the chances of dalit groups assuming a sub-continental, homogeneous, positive alternative cultural discourse is doubtful. Further, a mono-dalit cultural discourse may well uproot the natural regionalised cultural strengths of the dalits as possessing oral and written traditions and knowledges of their own, i.e., music, food, medicine, agriculture, hunting, fishing and so on. A major consequence of such an uprooting is that they will lose their 'positive history'. Reliance will have to be placed on sources such as Hindu scriptures and narratives whose agenda is to bequeath a 'negative history' for dehistoricising groups such as dalits, and valorise the subcontinental politics of the dominant castes as true history.

On the contrary, a dalit politics which situates itself in its respective

ethno-linguistic context and articulates a cultural significance which would encompass everyone—from the decasteised to the caste Hindus—has enormous significance. A community's knowledge systems and cultural values are rooted in its linguistic evolution. Dalit groups, despite the casteist onslaught, have survived, that too more humanely. It means that they have always possessed alternative knowledge systems *vis-à-vis* the discriminating Brahminical values. And these can only be deciphered from their linguistic structures (oral and written) and not from the Brahminical scriptures.

**S**ince the linguistic formations in the subcontinent have incorporated the dalits with other low caste people as one culture, it is important to unearth the contributions of the literateurs, medicine persons, musicians, agriculturists and craftspeople from the so-called lower castes (dalits) in shaping an alternative culture, both preceding and influencing the Dravidian movement in diverse ethnic contexts. Such an exercise would help dalits restore their self determination.

Such an endeavour for the restoration of their positive history has so far not been forcefully articulated by the dalits, primarily because they have shied away from shedding whatever was defined as nationality, nationalism and national development. Preventing this damage is central to the restoration of their non-Hindu cultural values. Such an articulation would automatically undo the stronghold of the caste Hindu subcontinental politics because of the demystification of the latter's fantacized historicity, from which they derive strength for their electoral politics. As for the dalits it would be a liberatory rediscovery of their cultures.

# The roots of dalit consciousness

ELEANOR ZELLIOT

THIS essay attempts to briefly look at the factors which set off a dalit movement, defined simply as a group of dalits who attempt over a period of time to establish an egalitarian place for themselves in modern society. More specifically, the essay deals at greater length with those factors that sustain the movement, the roots of consciousness, which allow pride, self-respect and a vision of the future. The word dalit in this context includes all those from ex-untouchable communities—Hindu, Christian and Buddhist—who define themselves first as dalit (oppressed) rather than as harijan, untouchable, or by their caste name. It is a name chosen by the groups themselves and indicates a political and social awareness.

The source of a dalit movement can be economic, either new opportunities or the denial of one important to the group. (For instance, in the case of the Maharashtrian movement, it was new opportunities in Bombay, Nagpur and smaller towns that were not attached to the 'inferior village ser-

vant' role, and also the loss of military recruitment as the British evolved their 'martial race' theory for their armies.) It can be legitimization by high caste Hindu reformers, although that is not by any means a certain stimulus. It can be the product of leaders within the group who by a chance of education or exposure to new ideas set out on a new path.

In the contemporary period it may be a critical mass of educated dalits. Or it might be a significant insult that triggers a unified response. Whatever the cause, and this is the key, it results in *an idea of self-worth* which is *not* recognized in the society around the group. And at this point, a movement is formed and subsequently uses the historic or the mythic past to produce the images which sustain the movement. Individuals in all castes have asserted their human rights and sought change; this essay deals with dalits in groups.

In the Indian situation, while there are a number of movements

among specific untouchable or dalit castes, one also comes across other castes who, although they may feel oppression, have evolved no path of protest or change. These groups too have their source of pride, which may be equally mythic or historic.

**A**s an example, is the story of an untouchable caste in a Bengali village which is desperately poor and in need of economic improvement. They are a proud group, but their pride is founded in their religious duty of carrying the Goddess Durga's palanquin, and that they continue to do. This is recognized as essential for the village, and that is enough for the untouchables involved! They feel important, connected to the world around them, and there is no impetus for change.<sup>1</sup>

The movements I have in mind as I try to theorize about change are the older movements of the Adi-Dharm of Punjab and U.P., the Satnami of Chhatisgarh, the Narayana Guru movement in Kerala (although the Ezhavas were no longer considered untouchable by 1930) and in the contemporary period the dalit movement in Karnataka, the rise of a dalit Christian movement in Tamil Nadu and Andhra Pradesh, the phenomenon of Kanshi Ram, Mayawati and the Bahujan Samaj Party (BSP) in Uttar Pradesh, the new political thrust in Tamil Nadu and, of course, the dalits of Maharashtra with their ever more creative forays into the modern world of education and culture.

I am not clear about the factors that produced each of these movements, except for the Maharashtra movement,<sup>2</sup> nor the historic or mythic elements of their beliefs about themselves. What I can do is to note those

1. This story was told me by Krishna Soman who is now working on women's concerns at the Indian Social Institute, New Delhi.

2. See my *From Untouchable to Dalit: Essays*

instances in which a mythic past does *not* produce a movement for change, analyze factors accepted and rejected in the building of the Ambedkar movement in Maharashtra, speculate on elements of the past that serve in some areas as catalysts and not in others, and end with a view of the present place of the larger than life B.R. Ambedkar as the new element in movements all over India. A recent seminar in New Delhi at the Jawaharlal Nehru University on Ambedkar in Retrospect brought together dozens of scholars, and some of them, those from south India in particular, encouraged me to stress the cultural aspect of the post-Ambedkar dalit movements.

**F**irst, there are a number of interesting uses of the past among untouchable groups which do result in pride and often a sense of identity but not in any change. The prime example, perhaps, is that of the Bhangis who find meaning in their chosen name of Balmiki, referring to the author of the epic, *The Ramayana*. There seems to be no perceptible effort among Balmikis to change their role in society as sweepers and removers of human waste, although individual Balmikis have certainly changed their status in society. Ravidas, the 16th century Chamar saint-poet who is famous throughout the north and in Maharashtra, is both used as a name for certain groups of Chamars (leather workers) and as their claim to historic worth. Ravidas temples dot the north, and a grand temple is being built at the end of the line (down river) of temples on the *ghats* of Varanasi, a temple begun by Jagjivan Ram when he was at the centre of Congress power. But the Chamars are seeking a new power through political means in the name of

*on the Ambedkar Movement*, Manohar, New Delhi, 2nd edition 1998, first published 1992.

the Bahujan Samaj Party (BSP) in Uttar Pradesh, not through Ravidas.

**A**n incident in Maharashtra underlines the limits of Ravidas as a catalyst. The saint, known there as Rohidas, is famous among the Chambhars of Maharashtra as *their* saint, even though they are Marathi and not Hindi speakers. In the grand pilgrimage to Pandharpur, the best known of Maharashtra's religious events, Chambhars became part of the *palki* (procession of palanquins) leading Alandi, the most honored of all palkis. Until some 20 years ago, Chambhars marched in their *dindi* (a smaller group of devotees within the palki) in front of the white horse which symbolizes the eternal presence of Dnyaneshwar, founder of the Pandharpur bhakti movement.

Since all other dindis marched behind the horse, with the Brahmin dindi at the very end of the long procession, they instituted a movement, including a legal case, to move their dindi behind the horse. And now the Rohidas dindi right moves behind the horse, followed by all the others, with the Brahmins at the end of the palki. As the most important palki, its place is at the very end of the long line of palkis which march from the gathering point outside Pandharpur into the city.<sup>3</sup>

Rohidas does encourage some movements; his *dharmashala* in the town of Pandharpur is also a centre of teaching and is a lively place filled with students. In the north, Rohidas temples are statements of pride and gathering places. But a modern movement of the masses in his name seems

3. An article by Irawati Karve, 'On the Road', best reproduces the spirit of the Pandharpur pilgrimage, including its adherence to caste. It has been most recently reprinted in *The Experience of Hinduism*, edited by Eleanor Zelliot and Maxine Berntsen, State University of New York Press, Albany, 1988.

unlikely. In the meantime, Chambhars in Maharashtra have chosen to be called by the more Sanskritic name of Chamakar, while Chamars in the north often prefer the name of their saint, Ravidas.

**A**nother example from the bhakti movement, India's most egalitarian religious period, is the significance of the Tamil untouchable saint Nandanar to untouchables in the Kolar Gold Fields. They see Nandanar, who finally entered the temple after much effort and was engulfed in the image of Shiva, as part of the Shiva Nataraj iconography. Many images of the dancing Shiva show flame-like waves flowing from his waist or hips, and for this group of devotees, those waves are their beloved Nandanar, part of God himself.<sup>4</sup>

According to Partha Mukta, Mirabai serves as a woman who suffered as does an untouchable group in Gujarat and she is revered as symbolising hope and comfort in their lives. Devotion to Ram in an intense way serves as an identity for an untouchable group in the Hindi belt, according to Ramdas Lamb. Ghashidas, founder of the Satnamis of Chhatisgarh, is sometimes seen as an incarnation of Buddha, Shankaracharya and Ravidas, according to Saurabh Dube. These associations with saints and gods can be very powerful. Until the coming of Ambedkar on the scene in Maharashtra, Mahars found their saint of the 14th century, Cokhamela, a very meaningful reference point for their piety and worth. Although Cokhamela protested against the very idea of purity and pollution, he also blamed his birth in an untouchable caste on sin in a previous birth. This justification for untouchability was not acceptable to Ambedkar, or any modern reformer.

As I look for the symbols that create that all important quality of self-respect, I find that most untouchable castes do have some source of pride. The culture of those on the bottom is not yet a subject of current serious scholarship. But, especially in the South, there seems to be a new trend of looking at the folk culture of various groups. *Pariah* after all means 'drum', and a pariah has brought the traditional drumming of his caste into the Tamil movie industry. The Tamil Theological Seminary in Madurai has videotaped the traditional culture in the untouchable quarters of a village, and Henry Tyagaraj of the Dalit Liberation Education Trust takes a group of American students from the Semester at Sea programme to a Tamil village for an evening of dalit folk culture every year. This interest in folk culture is a link between the masses and the elite, and may become one of the sources for pride in a more sophisticated way than it now is.

**K**ancha Ilaiah has written at length about the gods and goddesses of those who are, according to his research, not Hindus. The dalitbahujan peoples have a separate culture and philosophy as well as a political economy which involves working with their hands.<sup>5</sup> Ilaiah feels that 'the dalit wadas and the cultural life that dalits live has a powerful potential to become universal... dalit music, songs and... dance... can produce many Gaddars, many Illayarajas, it can produce many intellectuals whose knowledge is much more explosive.'<sup>6</sup>

The bhakti movement, the service of untouchables in the British army, folk myths, and 19th century

thought, both British and Indian, created many symbols that could be pressed into the service of a dalit movement in Maharashtra. I have noted that the 14th century Mahar saint, Cokhamela, was in the late 19th and early 20th century a symbol of religious worth. Some Mahars called themselves Cokhamela (as Chamars in the North call themselves Ravidasis). Hostels and schools were started in his name. Poems challenged Mahars to be as brave as he was and to enter the temple.

**B**ut with Ambedkar's perception of Cokhamela's limitations, especially the saints' acceptance of *karma*, and the fact that no untouchable could enter the temple at Pandharpur but had to stop at the *samadhi* of Cokhamela at the foot of the great door, the usefulness of this symbol as a dynamic catalyst ceased. His importance now is to scholars from the community! A number of them are working on Cokhamela for Ph.D. degrees; there is interest in his wife, sister, son and brother-in-law as an unusual family of bhaktas; there is belief in some quarters that Pandharpur was actually originally a Buddhist site.

A belief that was important in the 19th century, and surfaces today both in Maharashtra and in other states, is the idea that untouchables were 'lords of the land', the original dwellers and rulers of the country, displaced by the Aryan invaders. Again, this is an idea which was not part of the belief structures that Ambedkar built. It might have been his knowledge of the race situation in America,

the 'Ambedkar in Retrospect' conference held at Jawaharlal Nehru University, New Delhi, 27-29 August 1998, p. 17. Gaddar is a folk singer of great popularity in Andhra Pradesh. Illayaraja is a music director in Tamil films who has introduced the folk drumming of pariahs as an important art and with great effectiveness.

6. Ambedkarism and the Indian Counter Culture. Paper presented by Kancha Ilaiah at

gained because Columbia University, where he spent three years, is on the edge of the huge black area called Harlem. It might also have been his firm belief that all peoples are ethnically divided, and that Indian peoples are not in any special way divided between Aryan and non-Aryan.

**S**ince India also has tribal peoples, indigenous groups called *adivasi* (first dwellers), some of whom do have a different language from either the North or South languages, it makes it difficult to think of peoples as integrated into economic life as are untouchables as a separate race. Ambedkar's theory was that Aryans mixed with local peoples from their early incursions into India, and that untouchables were at one time Buddhists, forced to live outside the village in penury when Brahmanical religion became strong, probably around the 4th century A.D.

There are stories of heroic sacrifices by Mahars such as that of Amrutnak, who mutilated himself when he went to search for the Queen, lest it be thought he had seduced her, or she him, on the way back from her captors to the palace. Stories of sacrifice appear in the various Gazetteers and are common to untouchable groups everywhere, but do not figure much in modern identity building. A hero such as Lahuji Mang, a wrestler and physical trainer associated with Mahatma Jyotiba Phule, a 19th century radical reformer in Maharashtra, is emerging as a hero to the Mangs, whose movement for a place in the sun is just beginning.<sup>7</sup>

A symbol used early in the 20th century by pre-Ambedkar reformers came from British history. The English parliament had been opened to the common people almost a hundred

7. The Mangs also claim a modern author, Annabhau Sathe, whose fiction contains

years before, argued Shivran Janba Kamble, a butler in the Masonic Hall in Pune and an early educator and spokesman. So why couldn't the British in India open the democratizing process to India's low classes? Ambedkar continued this idea of finding parallels in other countries, or universal principles from a collection of varied cultures. The Dalit Panthers, a militant group of young poets in Bombay in the early 1970s, clearly took inspiration from America's Black Panthers. My feeling is that the life of comparable groups in Europe or America may have considerable value as a stimulus even below the elite level.

**T**he most meaningful symbol for the Mahars of Maharashtra was that of military service. There actually were guards for the forts of the 17th century King Shivaji from untouchable castes, but it was service in the British army which became mythic, and it was denial of that opportunity in the latter part of the 19th century which triggered the first attempt by a Mahar to appeal to the British government. The petition of Gopal Baba Walangkar was carefully drafted but never sent, evidently through lack of courage among the retired armymen he contacted.

The idea of militant bravery became ever more important, however, and in the 1920s Ambedkar took a group of his followers to a pillar in the village of Koregaon outside Pune which commemorated the victory of the British over the Peshwa of the Maratha empire in 1818. The name of every soldier who fell in the battle, British and Indian, is engraved on the Koregaon pillar.<sup>8</sup>

stories of early Mang nationalist heroes, and it is Annabhau's statue which occupies a proud place in Pune as a symbol of the Mangs' creativity.

The Koregaon pillar became a symbol of Mahar militancy and bravery. When a Mahar regiment was added to the British Army roster in 1942, the caps bore an image of the Koregaon pillar (changed when India became independent). When the Dalit Panthers were born, the Pune branch members would bicycle out to the Koregaon pillar for inspiration.

**N**ow, on 1 January, there is an all-day celebration of the Ambedkar movement, which includes speeches by politicians, marches by various local Samata Sena (equality army) groups, Buddhist *vandana* (Pali chanting), displays of Buddhist and Ambedkar literature and cassettes, and a fair for the children. It is a massive affair with groups coming by truck, rickshaw, bicycle, on foot (some carrying torches), bus—any way, in the thousands. The importance of Koregaon must be seen in the past of the untouchables. Subservient, uneducated, considered inferior in every way, untouchable castes must build a new courage before they can challenge the hierarchical system.

Although military service has been of immense importance in Maharashtra, the fact that untouchables in Madras were important components of the sappers and miners in that army seems not to have been used to build a new image. In Maharashtra, a Chambhar cricketer, P. Balu, was one of the best players in India and probably also in England, in the first quarter of this century. Though a valued player he was not allowed to become captain. Ambedkar felicitated his victories, and he remained a

8. Is the Koregaon pillar unique? Or can the names of those especially commemorated by the British be found in other battle sites in India? There are names of Jews and Muslims as well as Mahars (and others) on the Koregaon pillar.

member of the Ambedkar movement until the conversion announcement in 1935. (At this time, most Chambhars left, protesting against the rejection of Hinduism.) Given the importance of blacks in sports in the U.S. to a sense of achievement and worth, it is strange that P. Balu has not been accorded a hero's role in Maharashtra.

**M**ahars and Mangs were known for their musical abilities. A proverb often quoted is: In the Brahmin home, books; in the Maratha home, grain; in the Mahar home, song. But although there is always music, usually by semi-professional groups, at the occasions of Buddha Jayanti, Ambedkar Jayanti and other gatherings, little is made of past talent. The *jalsa*, a musical and theatrical presentation of ideas, was a feature of the early Ambedkar movement but like the folk drama called *tamasha*, which was largely in Mahar hands; it no longer is of ideological importance. Nor is the unique religious role of the Mahar as the *potraj* servant of Mariyai, goddess of pestilence. Her temple is always located in the *maharwada* in Maharashtra, but by and large it is Mangs who now perform her service. Mangs also continue to play at weddings in semi-westernized bands. I think that when these entertainment abilities are seen as service at the behest of upper castes, they lose their ability to promote dalit consciousness.

In Maharashtra, ever since he began his newspapers and conferences in the 1920s and in most other parts of India since his death, Ambedkar has been the all-important symbol in the creation of dalit consciousness. The examples are legion. His statue is placed on land reclaimed for dalits from caste Hindu usurpation in Tamil Nadu. Town councils put up bronze images to acknowledge the

importance of their dalit populations. Slum dwellers and villagers alike make plaster images, complete with spectacles, to state their loyalties. Universities and research institutes from Delhi to Madurai are named after him. A dalit woman doctor from Andhra spent seven years of her life, leaving her clinic and her son in the care of her supportive husband, and made the finest film on the life of Ambedkar so far produced. The books and the poems on Ambedkar, both from without and within the movement, proliferate. And when dalits go too far in challenging the status quo, the image of Ambedkar is attacked.

**T**he meaning of this symbol of the statue or the photo grows from the life and work of B.R. Ambedkar. The image is always clad in a western suit, white shirt, red tie, pen in pocket, book in hand. The image usually represents Ambedkar with an upraised arm, teaching or declaring the message of courage and equality. It stands erect, unmoving. This is what the image represents: education, success, contribution to the political world of India, courage, empowerment through reservations, protection through a relationship to government, 'one of us' who was not only important personally but was important to India. The book the image of Ambedkar carries is the Constitution, and his role as chairman of the drafting committee has assumed great importance and symbolic value. He is without specific caste. He is dalit of dalits. He has no identity as a Maharashtrian. He is all India.

This overpowering image of Ambedkar does not obliterate other 'roots of dalit consciousness.' Rather it encourages dalits to look for the abilities, the talents, the triumphs, both of the historic past and at the folklore of the village as well.

# Caste and economic reforms

K. S. CHALAM

IN the Indian sub-continent, caste is considered a special social category. It is rarely analysed by social scientists as an economic category, notwithstanding the fact that though its manifestation is social, its essence is purely economic. In fact, the social anthropologist, H.W. Wiser, who examined caste and introduced the concept of *jajmani* for the first time in the 1930s, analysed the transactions between different castes in a village in purely economic terms.

The real transactions between brahmins and kshatriyas, between the *dvijas* and other servile castes, and among the servile and untouchable castes were found to be purely economic in nature. Wiser estimated the value of products and services transacted between castes in Kalimpur village and established that the brahmin provided only intangible services and took the highest value of goods and services from others. At the lowest level, the untouchable provided the maximum value in terms of goods and services and in return received the lowest value. If these values are trans-

lated as returns on each caste's stock of property, the concept of caste as an economic category becomes clear.

Marx has argued that social relations are always embedded in economic relations which are nothing but property relations. In this context, caste is coterminous with property in India. However, considering the Hindu caste as property has certain limitations. The character of property as a thing to exchange with others or sell to outsiders is extremely limited. Caste should be considered a communal possession and not as private property. Wiser posits that caste was a corruption of the ancient custom of communal ownership under the control of the *panchayat*. In other words, caste is a Hindu category of property with the brahmin possessing the highest value and the untouchable assigned the lowest.

Viewed from this angle, the caste system as described by Ketakar and adopted by Ambedkar does not represent a division of labour. It is a division of groups of people with each assigned a particular economic value.

The castes, being economic entities, accumulated these values over a period of time. But, the Hindu superstructure which protected this economic caste base did not allow the non-dvija castes to accumulate and capitalise their value. The dvija castes of brahmin, kshatriya and vaisya were given the right to education, assets, weapons and so on, which naturally accumulated (maybe primitive accumulation) capital over a period of time and improved the value of their human capital. This was denied to the *sudras* and untouchables. As a result, the social manifestation of unequal exchange between castes has in fact an economic base, as caste is synthesised as property in India.

**C**aste, being a property of a group of people, could be utilised to the advantage of the members of the group. It has been used to exploit others as also to empower one's own group. These concepts have been used here to understand the economic power of the dominant dvija castes, particularly the brahmin caste in India today.

In modern democratic societies, the struggle between different political groups is ultimately over the distribution of resources. Those who succeed end up controlling resources which enables them to provide patronage. In India, the brahmins have played the role of arbiters and thereby enjoyed the patronage of whoever wins out. Kautilya, a brahmin intellectual, laid the foundation for a brahminical political economy much before the emergence of western economic theory.

Kautilya's political economy was based on a principle that every person is dishonest as against the western notion that human beings are rational. The *Arthashastra* details how the state should generate revenue and how it should be spent. In the state

hierarchy, ministers enjoyed the highest status followed by the *purohit* (priest). Generally both were from the brahmin community. Kautilya observed that the king could cheat people in generating revenue for the exchequer. These Kautilyan principles were followed by most kings till the emergence of an urban economy.

The emergence of a manufacturing sector and an urban economy can be traced to the Muslim rule in the middle ages. But the Muslim rulers too employed brahmins to interpret the *dharmasastras* and consequently brahmin hegemony continued even during the Muslim rule. Brahmin scholars mastered Persian, the court language. Many of the *munsabdars* were brahmins. Unlike the ancient *purohitis*, the ministers both under Hindu and Muslim rule, grabbed land either in the name of *inams* (land grants) or through subterfuge, in the process becoming owners of vast tracts. By the time the British came to this country they had become powerful landowners.

**D**uring the British regime, the brahmins joined forces with them as *babus* and exploited the toiling masses. The emergence of a modern bureaucracy was a boon for the literate brahmins who joined in large numbers, ultimately bringing it under their control. The bureaucracy under the British regime established control over resources, particularly revenue and land distribution.

The surplus from the agricultural sector, generated due to the introduction of modern methods, helped develop the artisan guilds. Further, the development of international trade through the East India Company and other agencies gave rise to a manufacturing sector in the country which was by and large under the control of non-brahmin groups. The brahmins slowly

shifted into secular occupations that accompanied industrialisation. They envisaged that the economy could be eventually managed and manipulated by them even though the British were a hindrance to their plan. Mahatma Phule in his book *Gulamgiri* describes how the brahmins exploited the masses and even cheated the British.

**A**fter the British left in 1947, India saw the beginnings of a direct brahmin rule. Though there was abundant, educated and skilled manpower to manage the affairs of the economy, an overwhelming majority of those at the helm of affairs came from brahmin families. Babasaheb Ambedkar, in his statement on the state of education of the depressed classes in the Bombay Presidency, submitted data to the Indian statutory commission in 1928 proving that more than 50% of those enrolled in collegiate education were brahmins. Since the unemployment rate among the educated was very high during the 1930s and 1940s, Nehru felt that they should be utilised in the task of nation building. Influenced by the British Labour Party's policy of industrialisation and socialism and the Soviet model, Nehru advocated a public sector which would occupy the commanding heights of the economy.

The Soviet model was suitably modified to suit the Indian situation without nationalising the means of production. Naturally, most public sector undertakings came to be managed and operated by educated brahmins. The important sectors of the economy were brought under the control of the bureaucracy through its license-permit *raj*. The brahmins started migrating from the rural areas to the urban centres leaving behind some of their lands and assets. In order to provide some relief to the people, land reforms were introduced but only

after most brahmins had sold off their lands. Those who held on to their lands and assets and clung on to the old traditional ways suffered. But most converted their agricultural rural property into urban property. In the process, some land got transferred into the hands of the hard-working middle castes.

Most brahmins came to occupy modern secular jobs and enjoy the highest security and economic privileges in the country. Soviet style planning was introduced in the country in the 1950s and the huge investments during the plan periods were basically managed and their fruits enjoyed by the brahmins and dvija bureaucrats. In the process, they slowly converted public property into private property. By the end of the 1980s, the upper castes had acquired assets worth crores of rupees in the form of urban property, real estate, shares in private companies and were in a position to develop an independent economy.

**W**hen several studies on social economy of Tamil Nadu revealed that the reservation policy of the DMK government had reduced job opportunities for brahmins, enterprising brahmins started developing private enterprises using public money from the centre (cf. Sundaram Finance, the TVS group). Even a casual look at our metropolis and urban areas would reveal that posh localities and government developed estates came to be occupied by the upper castes. All banks in the country are either managed or owned by them.

The Mandal Commission shows the strength of the brahmins in the Indian bureaucracy which manages around 50 % of our GNP. Further, higher education, subsidised by the public, helped them to acquire skills and subsequently become well paid NRIs.

The license raj had helped the upper castes develop private industry at the cost of the public sector. Over-time the scheduled caste and tribe people also began to be employed in the public sector, challenging dvija hegemony. In the South, OBCs also joined the ranks of the employed in the modern public sector. The brahmins, having fattened their private exchequer with public money, no longer thought of the public sector as beneficial to them. In fact, they felt that its continuation could pose a danger with the emergence of the dalits as a formidable force.

**A**s the bahun concept gained momentum, the upper castes thought that it would benefit them both economically and politically if the economy was privatised and linked to the international market. The brahmin experts in the World Bank and the brahmin bureaucracy in Delhi conspired and mortgaged the economy when the *bahujans* began emerging as a force to manage the economy and enjoy the benefits. They thought that it would be difficult to fight the bahujans if the struggle to control the economy remained an internal question and therefore conspired to internationalise it. The international manoeuvrings of Narasimha Rao towards an Aryan hegemony by combining Germany, Russia and India was only a move to curb the emerging bahun power and to get international support to crush the indigenous bahun majority. The new economic policy and the Dunkel Draft must be seen in this context.

The new economic policy has not created new opportunities for the reserved groups in the public sector and they continue to be subservient to private brahmin economic power. The arguments provided by World Bank experts that the untapped rural human

and material resources would be exploited and utilised through international markets remained a myth. The concept of a human development index as developed by these experts, if applied to the social life of the Third World countries like Brazil where similar policies have been implemented, shows that they benefit only the metropolitan capitalist groups. In the Indian context they include mostly the Brahmins and the dvija castes. This is because the international market is controlled by cartels and only helps those who are already a part of the mainstream and in a position to manipulate the market.

The bahujans being economically poor cannot influence market forces. The brahmin who has already entered the private economy and is in a commanding position both at the national and international level will be the largest gainer of the NEP. This is the dvija economic policy currently being pursued in the country. Thus, caste is being used as a source of economic capital. The value of the capital has been further strengthened in the democratic set up by using state power to capitalise the value of capital, particularly in the area of human capital through investments in education, health and so on, that largely benefit the dvijs.

**I**t is this accumulation of capital in the caste mould that helped to create an internationalised elite to operate a post-modern capitalist economy in a traditional society like India. It is much easier for this class to manage the economy by slowly transferring the public sector into their hands in the name of privatisation and globalisation. Economic reform has not abolished the traditional classification of society based on birth; rather it has further strengthened the already capitalised castes.

In the recent past, while economic reforms have widened the gap between the dvija castes and others, they have also created differentiation among the sub-castes of the dalits. This was an interesting development of the post-independence period. The differences among the sub-castes of dalits persisted due to historical reasons. When British officials coined the term scheduled caste under the Government of India Act 1935, they used purely social tests like untouchability, literacy, and distance from brahmins to identify and lump them together as scheduled castes. They did not consider other criteria such as economic status, size and location of each caste, and the distance between one caste and another. These differences have now surfaced with limited opportunities to enter the public sector and a demand for better endowed persons by the private sector.

**T**he census data shows that there are 22 dominant scheduled castes in the country, each numbering over one million. These 22 castes constitute 56% of the scheduled caste population, the remaining 44% being accounted for by more than 1000 other small castes. The problem is similar among the tribals. The socio-economic and educational development of these 22 castes have been discussed in a cursory manner by various social scientists and even by dalit leaders. The problem today, however, is that some kind of differentiation is taking place among the 22 dominant scheduled castes *vis-à-vis* the dominant and small castes. This phenomenon can be largely attributed to the policies pursued by the ruling classes in the country.

The ruling class has systematically coopted the dominant castes among the dalits in each state through identifying and encouraging leaders from only among the dominant sched-

uled castes for electoral politics. This has been done through various government welfare programmes like private social welfare hostels, IRDP, and other kinds of subsidies. These programmes have mainly benefited the family clusters of the leaders of the dominant caste in the region. Jagjivan Ram for chamars in the North, and Sanjeevaiah for Malas in the South are good examples.

**T**hough the leadership among the dominant dalit castes has helped in articulating the overall problems of the dalits in general, it has been unable to comprehend the specific problems of the small and minority castes among the dalits. It has also failed to develop a strategy of development suitable to each sub-caste among the scheduled castes. Probably as the dalit leadership in the post-Ambedkar period was in flux, it had little opportunity to study, analyse and understand the problems of the 1000 castes.

There are several castes in the country which are specific to a region. Therefore, the general policies pursued by the government cannot address the specific requirements of small castes. Even the benefits received by each caste are not uniform. The accompanying table details the number of post-matriculation scholarships awarded by each state in the country during the year 1994-95. It provides an indication of social and educational advancement of dalits, as also their entry into the elite formation since they prepare them for active participation in the modern sectors of development, including the bureaucracy and institutions of political power.

States like Andhra Pradesh, Gujarat, Karnataka, Kerala and Maharashtra have cornered most of the post-matric scholarships in excess of their proportion in the SC population of the country. States like West Bengal,

Uttar Pradesh, Rajasthan, Punjab, Orissa and Bihar, with the largest concentration of scheduled castes, are in no position to fully avail the benefits. These regional differences indicate the inequity in the distribution of benefits among the scheduled castes living in different states.

It is evident that among the dalit sub-castes, social and economic mobility is rapid among some castes and much slower among the marginalised sub-castes. For instance, in Andhra Pradesh, the Madigas are relatively backward compared to the Malas. Among the Madigas, those from north Andhra and Telangana are more backward compared to coastal Andhra. In fact, a few advanced groups among the Malas and Madigas have evolved a patronage system to perpetuate their power and corner privileges only among their families. This has provided upward mobility to a few groups or cluster of families in each caste.

**T**he location of a caste in a region within a state has both advantages and disadvantages. The caste groups in a historically advanced state like Maharashtra, where Babasaheb Ambedkar started his revolutionary movement, enjoyed an advantage over states like Bihar and Orissa where the Buddhist revolution is now only a matter of history. Therefore, people living in Bihar or Orissa are relatively handicapped compared to those in Kerala, Maharashtra or Gujarat.

The scheduled castes, particularly the numerically small castes located in the backward states, are doubly marginalised. Such double marginalisation is also possible within a state across different regions. People living in highly fertile and irrigated areas have a continuous source of income and employment as compared to people living in dry and highland areas. The scheduled castes, who are

spread in different regions of a state, also acquire the same qualities. Given the limited package of benefits, the backwash effects of development of certain dominant scheduled castes result in the underdevelopment of several small and marginalised castes within the region.

The sub-castes among the scheduled castes who have benefited from welfare programmes and education are able to utilise the advantages of modern technology. This will further widen the gap between the less developed and the socially and economically advanced dominant castes. Disparities exist even among the dominant castes, but they are more pronounced between the dominant and the marginalised castes than among the advanced. However, there

are very few studies at the sub-caste level to substantiate this point.

The socio-economic and cultural ethos of different castes is not uniform. No attempt has been made to study the diversities and uniqueness of each caste so as to develop a strategy to bring them together in the process of bahujan formation. It appears that even in the Bahujan Samaj Party no intellectual grouping has been established (except one comprising of a few bureaucrats) to analyse and articulate these problems on a continuous basis. The slogan of capturing power by a brute majority is advocated across the country without considering the specific requirements of each caste and tribe. Politics may be a numbers game, but social reform and amalgamation of different castes into

a mass is not equal to the sum of the parts. The mass is different from an aggregation of the parts when the parts are of unequal size and quality.

This is understood by the ruling classes who now attempt to play off one sub-caste against another by using the same traditional tactics and slogans. It is imminent that the castes holding power will break the solidarity of the scheduled castes which was built on the emotional issues of untouchability and exploitation. Trapped within the same language and methodology, the dalits have now started fighting each other. Sometimes this is orchestrated by the ruling classes who ultimately want to prove that each sub-caste among the dalits is also a minority and thereby not equivalent to that of any single dvija caste. Therefore, the danger of a minority ruling the majority, according to them, does not arise as Indian parliamentary democracy today is an oligarchy of castes and not bahunans (the majority).

**T**his distorted formulation needs correction. In a country like India, social democracy should provide opportunities for each caste, small and big, to equally participate in the decision-making process. This is possible only when our leadership learns from history and from the teachings of social reformers like Kabir, Phule, Ambedkar and Periyar who believed in bringing people (i.e., castes) together. Therefore, what is needed is a mass reform movement among the dalits to promote brotherhood and solidarity through inter-marriage, inter-dining and, more important, recognising the existence of each sub-caste as a unique cultural entity. Otherwise we will be unable to thwart the attempts of the ruling classes to ferment a counter revolution even before the beginning of a social revolution of bahunans in India.

TABLE 1

Post-Matric Scholarships For SCs During 1994-95

S. No	Name of the State & UT	No. of beneficiaries	% recipients to total awardees	% of SC to total population

# The BSP in Uttar Pradesh

SUDHA PAI

THE dalit movement (DM) in Uttar Pradesh under the leadership of the Bahujan Samaj Party is today at a crossroads. On the one hand the BSP has constructed a strong DM based upon identity and consciousness in a state which still has a rigid and conservative social structure, and which experienced no anti-caste movement/Party in the post-independence period except the short-lived Republican party of India in the 1960s. On the other, despite considerable politicisation of dalits in U.P., the BSP has failed in its avowed goal of displacing *manuvadi* forces and introducing social change, and has compromised with these same forces. Its leadership is today faced with the difficult decision as to whether it is a DM with an agenda of radical social change, or a political party driven solely by the compulsions of achieving power.<sup>1</sup>

\* This paper is part of a larger project, 'Democracy and Social Capital in Segmented Societies', funded by the SIDA (Sweden).<sup>2</sup>

The achievements and future direction of the BSP-led DM can be assessed by examining its origins, ideology, mobilisational strategies and programmes when in power.

The BSP has certain specific characteristics arising from its origins which distinguish it from dalit parties/movements in other parts of the country. The early 1970s witnessed the rise of a number of dalit organisations in the western and southern parts of the country, such as the Dalit Panthers in Maharashtra in 1972 and the Dalit Sangharsh Samiti in Karnataka in 1974. Led by a new generation of educated dalit leaders, they represented a

1. In a recent paper Ghanshyam Shah has argued that the DM in the country has reached an 'impasse' in terms of both ideology and strategies in relation to existing complex ground realities. This would apply to the movement in U.P. 'The Dalit Movement: Has it Reached an Impasse?' Paper presented at the SIDA project Seminar on Challenges to Indian Democracy: State, Market and Politics of Ideology on 24-25 August 1998, at the Centre for Political Studies, JNU.

new type of protest movement against the failure of the state to eradicate caste oppression and untouchability. They were 'liberatory', rejected the Brahminical order and state welfare and identified with the poor and oppressed. Drawing upon both the Marxist and Ambedkarite traditions they tried to form a broad coalition of dalits, non-brahmins, middle and low castes, peasants and workers.<sup>2</sup>

In contrast, the BSP had its origins in a lower middle class trade union organisation of government employees, the BAMCEF formed in 1976 by Kanshi Ram, who had briefly joined the RPI in the late 1960s, but left it as he felt it was a Congress stooge. It was only later that its base broadened with the formation of the DS-4, both of which came together to form the BSP in 1984. Omvedt has described its formation as deliberate and not reactive.<sup>3</sup> As a consequence, the base of the party even today is among a new generation of educated, upwardly mobile and economically better off Chamar-Jatavs in parts of U.P., who have benefited from reservations in government jobs, rather than the poorer Balmikis or Pasis. The party has remained aloof from major dalit agitations such as the renaming of Marathwada University or the more recent protests over the desecration of Ambedkar's statue in Mumbai.

The BSP claims that its ideology and strategies of mobilisation are based upon the writings and speeches of Ambedkar, but actually draws

heavily from those of Kanshi Ram, and to a lesser extent Mayawati. Together they represent a post-Ambedkar leadership which has tried to adapt Ambedkarism to the north Indian political situation. When in power in the 1990s, they have also attempted to draw on the legacy of not only Jotiba Phule but also Periyar through the Periyar Melas. Initially, the party drew its ideological strength from a criticism of Gandhi and by Congress 'baiting', without which it could not mobilise the dalits and establish itself as their genuine representative.

The Congress party, Kanshi Ram declared, drawing upon Ambedkar's description of it as a unique blend of 'capitalism' and 'brahminism', has been the main instrument of the upper castes, and therefore the most 'manuvadi' and 'brahminical' party. He held it responsible for a pattern of development in which the benefits have not reached the weaker sections despite considerable progress after Independence. However, over the years he has tried to construct an alternative ideology.

Attempting a critical analysis of the Brahminical Hindu social order in his writings, Kanshi Ram argues that it is Aryan in origin, propagates an unequal social order based upon caste not class, rests upon falsehoods and religious myths, and is anti humanitarian. The dalits form the *moolnivasi* (original inhabitants) of the land and were conquered by the Aryans only to be reduced to untouchables.<sup>4</sup> Brahminism is described as a ruling socio-cultural ideology that has succeeded in dividing the majority into innumerable caste groups, in entering and dominating all aspects of life, including politics, today. Historically he

holds that no Hindu community has ever existed, that every *jati* had its own *samaj* or community.

The ideology of the BSP, thus, is similar to that of the anti-brahmin movements of south India. However, a fundamental difference is that its anti-brahminism is more political than cultural. The basic aim is to replace brahminical political rule by that of the dalit-bahujans, as it would provide the latter better status and speedier economic advancement. 'Political power,' according to Kanshi Ram, 'is the key by which any lock (obstacle) can be opened.'<sup>5</sup> Another central tenet of the party's ideology is the concept of retributive 'social justice' which, it is argued, would correct historical wrongs and provide dalits their rightful socio-economic and political position in Indian society. For achieving these goals, capture of state power is essential to introduce 'social engineering' from above, i.e., developmental/welfare programmes for dalit uplift rather than a revolution for destruction of the existing social order 'from below'.

A central position is hence accorded to the state and the *capture of state power* in the thinking of BSP leaders. They argue that the Indian state, which is under the control of brahminical leaders, propagates its ideology through the educational system, socialising the younger generation, and thereby ensures the continuation of an unequal system. All government policies based upon such thinking have prevented the upliftment of the dalits after Independence. The establishment of a democracy and adult franchise in the post-independence period has helped the *savarnas* and parties formed by them

to continue their hold over the social and political system by means of vote-banks, money power and false promises. Hence, whether we attempt to establish capitalism, communism or socialism, it would make no difference so long as the power of the state is in the hands of the upper castes. In this situation poverty is seen as a result of social and political powerlessness rooted in the brahminical system, and not in an economic condition to be dealt with by government policies.

**A**lthough, following Ambedkar, the BSP believes in total revolution, i.e., destruction rather than reform of the Hindu social order, it is to take place not through social upheaval but the ballot box. Kanshi Ram visualises two stages by which the position of the dalit/bahujans would undergo a transformation: capturing power through mobilisation and electoral victory from the brahmins who comprise only 10-12% of the population, and a second phase when the revolution would penetrate deeper into society thereby transforming it.<sup>6</sup> The BSP on attaining power would establish real and substantial democracy which is rule of the majority, i.e., of the bahujans. Thus caste, which was used by the upper castes for oppression, itself becomes the weapon by which it is to be destroyed using the electoral system.

The mobilisational strategies of the BSP must be understood as evolving over a number of stages since the early 1980s in response to the changing political situation in U.P. During an early phase between 1985 to 1989, the BSP attempted to be both a radical movement and a party using all its three mobilisational strategies: socio-cultural, agitational and electoral. This was a phase of militant vertical mobilisation of the poor and exp-

loited, the ideologisation of caste as a tool to break the existing social order, and a strident criticism of mainstream parties. Many agitations were launched such as the struggle for social transformation on 15 August 1988, for self-respect and annihilation of caste. The party at this stage consisted of a band of dedicated workers cycling throughout the country, spreading their ideas among the oppressed sections. Although the BSP contested and gained no seats in the 1985 and 1989 Assembly elections, its base grew and it made inroads into the vote-bank of the Congress, emerging as the second-most important party in the state.<sup>7</sup>

**D**uring the second phase lasting upto 1995, the BSP moved closer to the Samajwadi Party (SP) to contain the Hindutva of the BJP, and worked as an Ambedkarite party to construct a 'bahujan samaj' based upon dalits, backwards, tribals, and the minorities. It drew inspiration from Ambedkar's conception of an 'autonomous' DM with a 'constantly attempted' alliance of dalits and *shudras* (workers and peasants in class terms).<sup>8</sup>

For Kanshi Ram, however, bahujan symbolised not so much majority as in Phule but an ideological tool to create a base for empowerment. With it he hoped to overcome the problem of not being able to achieve political power without the support of the backwards as the dalits constitute only 20% of the population, a strategy which proved successful in the 1993 elections. But the SP-BSP coalition lasted

for only 16 months from November 1993 to June 1995. The project was a failure because though the larger social identity of bahujan proved powerful enough to unite the dalits and backwards, overcoming their class interests to counter the all-encompassing Hindu identity sought to be created by the BJP, the conflict and competition among them led to its breakdown once power was achieved.

**M**ore importantly, it raised a controversy within the BSP of long term significance – whether it was exclusively a dalit or a broader movement incorporating the backwards – leading to a splinter group, the BSP (Raj Bahadur), in June 1995. Kanshi Ram holds that the creation of a bahujan samaj is at present not possible as the lower backwards are not as politicised as the dalits and lack both a strong leadership and an understanding of the need to unite and fight the *savarnas*. The fall of the SP-BSP coalition in June 1995 inaugurated a *post-bahujan* phase when the latter, impatient to gain power, moved closer to upper caste parties like the BJP and the Congress, transforming it from a socio-cultural movement to an opportunistic party.

In stark contrast to its earlier policies the BSP formed two coalition governments with the BJP in 1995 and 1997 and also forged an electoral alliance with the Congress. Paradoxically, this happened precisely when the politicisation of the dalits in the countryside had become widespread, with the movement managing to broaden its support base by the mid-1990s. A development first visible during the 1993 Assembly elections was the new assertiveness by dalits as a distinct social-political group in the countryside against the upper castes and even the backwards, with a desire to carry forward their own exclusive movement.

6. Kanshi Ram, *The Chamcha Age: The Era of Stoooges*, privately printed, New Delhi, 1982.

The election witnessed massive participation by dalits in many regions led by the BSP. The BJP performed well in precisely those regions where the BSP was weak or not well organised. All political parties in U.P. also showed an awareness of dalit assertion and the need to gain their support to capture power. The BJP, recognising the need to broaden its base, organised *samoochik bhojans* and a dalit laid the foundation stone of the Ram Mandir in Ayodhya; the JD under the leadership of Ram Vilas Paswan organised a Dalit Sena, supported the Dalit Shiksha Andolan and associated itself with activities of the Ambedkar Mahasabha. Even the IPF formed a Dalit Mahasabha in October 1993 to gain the support of the dalits in the eastern region.<sup>9</sup>

**A** second significant development which would help the DM advance faster than its politics of electoral mobilisation and coalition-building is the growing grassroots process of 'Ambedkarisation', i.e., an emphasis on separate identity, self-respect, a celebration of and widespread dissemination of the ideas and writings of Ambedkar which had a tremendous impact upon dalit consciousness in some areas. This phenomenon underlies the erection of numerous statues of Ambedkar in dalit *bastis* in villages across the state, the building of Ravidas and Valmiki temples and libraries, and use of 'Jai Bhim' and not 'Ram Ram' as a form of greeting. This has been the work of a new post-independence generation which is educated, socially aware, upwardly mobile, does not like the submissive attitude of its elders, and is determined to support only dalit parties.<sup>10</sup> The

formation of two dalit governments under Mayawati has given this process support and underlies the caste tension and violence of recent years.

**K**anshi Ram has argued that this phase does not mark a fundamental departure from the underlying Ambedkarite ideology of the DM but is only a tactical shift, as attaining political power by *any* means is both necessary and justified in the case of a dalit party in U.P. Despite the establishment of democracy, the upper castes in the state remain conservative, reactionary and unwilling to concede an equal position to or share power with dalits, whom they still treat abominably. He defines the coalitions/alliances as short term strategic associations to capture power in order to introduce social change 'from above'.<sup>11</sup>

The coalition governments proved short-lived due to differences between the partners over social policies, a problem that the BSP would have to consider prior to forming such alliances in the future. During both the periods when it was in power in U.P., in 1995 and 1997, the BSP used the opportunity to introduce a number of exclusively dalit-oriented policies in the field of education, social welfare, employment generation, and channeled a large proportion of state funds into the Ambedkar village programme.

For example, in 1995, the Mayawati government began the Ambedkar Rozgar Yojana for dalit women; the outlay on health and family planning was raised with 50% of it reserved for dalits; between 1991-97, 25,434 Ambedkar villages were identified by the U.P. government for

which a separate department was created and so on.

In 1997, realising that the government would last only six months, dalit officers were placed in top positions in the police and district administration to speed up programmes. The SC Act was used to protect dalits from upper caste oppression, dalit and Periyar melas were held, Ambedkar statues installed and stress laid upon the fact that it was a government of the dalits.<sup>12</sup> These policies led to a groundswell of support on the part of dalits but created widespread anger among the upper and backward castes.

**I**n retaliation the Kalyan Singh government, on assuming office in September 1997, announced that promoting *saamajik samarasata* or social integration among the people was its goal and sought to undo many policies of the previous government. It issued orders to check misuse of the SC and ST (Prevention of Atrocities) Act 1989, began a vigilance inquiry, ordered large-scale transfers of bureaucrats considered close to the previous government, and reinstated those punished or suspended by the previous government. This led to riots in October in which dalits were killed in Ghaziabad, Muzaffarnagar and Faizabad districts. In these incidents Ambedkar statues were destroyed and there were clashes between dalits and thakurs who did not approve of the collaboration between the BJP and the BSP.<sup>13</sup>

These developments have impacted on the electoral growth of the BSP. Up to the mid-1990s it was a party on

the upswing, but since then electoral results at the national and state level show that although its vote share has increased, it has not translated into more seats. Its policies in office have contributed to this in large measure. In its post-bahujan phase, social justice has been defined not only as retributive but also *exclusive*, i.e., meant only for the dalits and not the entire bahujan community.

**T**his has in effect meant a narrowing of the constituency to which the movement appealed. This has created considerable anguish among the rural poor, particularly among sections such as the MBCs, who feel that despite being backward and in many cases poorer than dalits, the BSP government has neglected them. Even among dalits it is the Jatavs who have benefited; the Balmikis and Pasis feel they have not gained much. As a result the BSP prior to the 1998 elections, despite having been in power in 1997, was faced with alienation of the BCs, a slow growth of its social base, and a lack of alliance partners which led to a division of votes favouring the BJP.<sup>14</sup>

The achievements of the BSP during its short span of existence have been considerable and significant. This has created a new identity and a counter-ideology to the *varna* system, namely dalit and Ambedkarism. It has succeeded in removing the hold of brahminical ideology and the submissive attitude of dalits, providing them with a new confidence, self-respect and hope of freedom from oppression together with economic betterment. It has provided a role model to DMs struggling to emerge in other parts of the country. In politics, these achieve-

ments have helped break down the vertical patron-client relationship with the upper castes and constructed new solidarities on a horizontal dimension. The BSP has made good use of the political space available to it following the decline of the Congress system to emerge as a strong political party in U.P.

Yet, at the same time, there has undoubtedly been a gradual regression from a radical Ambedkarite movement to a reformist party ready to compromise with upper caste elites. This has happened despite the party moving close to achieving power by the mid-1990s. This has mainly been due to its impatience to gain power by whatever means, to introduce changes from above rather than wage a long struggle at the grassroots.

**W**hile the decline of the Congress provided space to the BSP, the simultaneous rise of the BJP introduced a challenge from the upper caste supporters of Hindu nationalism. The failure of the bahujan samaj project, which could have provided a broader platform to fight upper caste domination, has been a contributory factor. Consequently, the BSP today faces a paradoxical situation. With the end of an era of a broad aggregative party system in Indian democracy, which successfully combined the interests of various groups in society, political parties now need to be representative of narrower interests and identities. This situation is to the advantage of the BSP, particularly in U.P. where caste identities have asserted themselves. Yet, in a society with numerous diversities, sectoral movements which mobilise only a segment inevitably reach a plateau beyond which they find it difficult to progress as they cannot appeal to those outside that segment. This is the dilemma facing the BSP which it must address.

# Understanding indignities

BISHNU N. MOHAPATRA

'Occupation is essential. And now with some pleasure I find that it is seven; and must cook dinner. Haddock and sausage meat. *I think it is true that one gains a certain hold on sausage and haddock by writing them down.*'

Virginia Woolf's diary  
Sunday, 8 March 1941<sup>1</sup>

IN his latest book, *Beyond Belief*,<sup>2</sup> V. S. Naipaul has depicted travel writers primarily as 'managers of narratives'. Social scientists also deal with narratives but very few are content with such a reduced ambition. Often, they tend to see themselves not as managers or custodians but as creators of narratives, authors of complex but credible stories. However, this particular self-definition does not cohere with an idea of social science colonised by the spirit of 'scientism' that feels diminished by the finitude of and the imponderables in human lives.

There was a time when this idea of social science and the ambition of 'modernity' travelled together. Anything that is slippery and unwieldy was kept outside the fold of social science for the sake of precision and prediction. Instead of transforming the methods to illumine the messy social reality, they tend to make social reality shrink to appear neat and fit the methodology at hand.<sup>3</sup>

'Objectivity' *per se* is not an unworthy ideal except that when over-

rated it becomes an unnecessary burden on the social scientists. This obsession has reduced the social scientists to poor story-tellers and mere specialists in documentation. Years ago this had prompted Alfred Cobban to comment that political science had lost its grasp of politics as well as of science. I hope it does not appear that I am merely rehashing some of the distrustful views associated with the postmodernists where truth is a mere conspiracy to keep dissent at bay. Nor am I arguing that relativism is the only answer to the misplaced certitude of the 'moderns'. I am concerned with understanding, not truth. My objective has been to stretch our methodology to an extreme so that it can better negotiate the reality.

'Modernity' might have freed us from some vices of the past but it has not prepared us to escape from its own 'scientistic' hubris. As a consequence, this has not helped us to understand politics better, and worse, many significant aspects of social realities have remained beyond our grasp. The incapacity to understand, particularly the experience of 'indignities' and 'humiliation' of persons, constitutes the entry point of this essay.

It all started with a raw feeling of dissatisfaction with the ways in which political scientists tend to analyse social indignities and humiliation. I hope scholars belonging to other disciplines, though unaware of the problems specific to political science, will still recognise this feeling. Empathy or lack of it, though crucial, is not what I have in mind here. Why

2. V. S. Naipaul, *Beyond Belief*, Delhi, 1998.

3. I am aware that my comments will not apply to social science in all its modern guises. Nevertheless, I think they capture a dominant streak.

is it that our representation of indignities arising out of political violence, caste hierarchy, class inequalities, dis-possession and rejection of various kinds appears a dry, statistical enumeration? I am not against statistics nor am I arguing against their usefulness. Why is it that Gopinath Mohanty's *Paraja* offers us a compelling account of the lives of *adivasis* in India which we do not find in the most competently written reports by the state or non-state institutions? Why is it that the autobiographical extracts of *dalits* in Arjun Dangle's<sup>4</sup> book on dalit writings give me more insight into their indignities than what I find in the reports prepared by the specialised departments looking into the welfare of the 'scheduled castes'.

One may say that the varied reception is due to the differences in 'genres' between fiction, an autobiography and a report. If this is true then my question is, what do we do with these writings? How should we respond to these genres? Why is it that while analysing or reflecting on dalit politics or the lives of dalits in India, their intense experiences (personal and collective) are not taken seriously? Is it due to our methodologies?

I do not have the answers but I raised these questions with my graduate students last year while teaching a course on Methodologies of Social Sciences. Dalit autobiographies/biographies provided an exciting frame to discuss some of these issues. The texts discussed were Hazari's autobiography, *Untouchable: The Autobiography of an Indian Outcaste*; D.P. Dás' *The Untouchable Story*; autobiographical extracts from Arjun Dangle's *Poisoned Bread*; and finally James Freeman's much celebrated work,

*Untouchable: An Indian Life History*. These texts were collectively read following the methodological considerations outlined earlier.

As soon as the 'reading' began we were overwhelmed by the personal experiences of the individuals who had undergone numerous instances of indignities and humiliation in their lives. Quite expectedly these narratives were 'first-person' accounts that were suffused with affective elements. An autobiography is primarily a subjective document, a confessional narration, although one can discern in it an objective structure of experiencing. Our first inclination while discussing these texts was to transform the first-person narratives of the autobiographies into third-person accounts. It was not difficult to utilise these materials to bolster up our argument against the pernicious impact of the caste system on the dalits of our society. Without being fully conscious, the intense experience of humiliation of the dalits became transformed into a series of data.

It was easy to see that many students laboured under the impression that their task as social scientists was to privilege the third-person account vis-à-vis the first person ones. For them the deeply personal narration in the autobiographies needed to be transformed into social science materials in order to be used for explanations. Attempts to obtain 'views from nowhere' exact their own price; without personal viewpoints social science becomes an anchorless enterprise.

In a significant sense these writings embodied the painful attempts of the authors to grapple with their experiences of humiliation and indignities. How do we understand the emotional outpourings that came out of the memory of humiliation? It does not take us too far if emotion is kept at bay,

both as an attitude of the interpreter and the nature of materials. The argument is that without the interference of emotion reality can be brightened up by, to use a Cartesian phrase, 'the natural light of reason'. According to this view, both the interpreter's emotion as well as the emotion of the subjects to be studied are impediments to be removed for a rational understanding of reality.

Another point of view is that emotional outpourings should be taken less seriously for they are mere subjective feelings lodged in human hearts and as such can only be explained in terms of individual psychology. Sometimes the impression is that it is impossible to access the deep hurt hidden in the heart of human beings. At any rate neither helped us acquire a purchase on the materials intended for discussion.

In order to understand the texts better we adopted a strategy that jettisoned an anti-cognitive understanding of emotion. The experiences of indignities/humiliation, often expressed in a personal idiom, exude knowledge and display epistemic value. The idea here is that emotional outpourings embodied in these autobiographies did throw light on their placements in the larger society and helped bring their contexts into a sharper focus. Let me quote from Hazari's autobiography, arguably the first dalit autobiography in English, dealing with his life during the colonial period:

Although I accepted the low wages and the long hours, I did not keep the job for more than a few weeks. One day, my mistress called me to say that I had deceived her with regard to my caste. She had found out that my father was working as a sweeper, while, by my name, she had thought I was a Hindu of the caste of a water-carrier. She gave

4. Arjun Dangle, *Poisoned Bread* (translations from Modern Marathi Dalit Literature), Orient Longman, 1992.

me my wages to date and dismissed me. This was a great blow to me in more than one respect. She had never asked me about my caste, and I had thought her intelligent and educated enough not to bother about her servant's caste or creed. Did the words of Congress mean nothing? It simply did not make sense to me. But I was not there to argue, and I came out of her room *with feelings of loathing* not only for my caste but for all men. The only thought that came to my mind was a couplet, which was a kind of motto in our family: The one everlasting who provides for the living/ also provides for the burial of the dead. But the *memory of my shame* was not easily washed away, even by mother Ganges.<sup>5</sup>

One can excavate many a moving passages from Hazari's autobiography which carry an amalgam of emotion and understanding. Though analytically separable they are fused together. The 'feeling of loathing' and the 'memory of shame' brought his social context to the foreground, including the half-hearted faith in the Congress party and 'modernity' (particularly the link between education and liberal values). The emotional turbulence in Hazari, one can argue, generated knowledge about his own contexts and the larger frame of a caste-ridden society. In it one can also discern a voice of a critic. Let me quote a longish passage from an interview I conducted with a dalit student at the Jawaharlal Nehru University.<sup>6</sup>

Student: My father was a constable in a small town called Salem. As long as I was there in the police

quarters I was not much aware of caste. My father took care of cleanliness because he did not want somebody to blame the children on that ground. From there I came to my village school. The school was not very far from my locality. First day my father admitted me in the school and left immediately. I was attending the class and suddenly I felt thirsty and asked the teacher to go outside by raising my thumb. (You had to show different fingers to express different reasons for going out of the class.) The teacher said I can go but did not tell me whether I can have water. Immediately another fellow followed me and I was about to take the glass. It was a cement tank with a wooden lid and it was clean water. This fellow took the glass from me and told me to cup my hands. I asked him why and told him to give the glass to me after drinking the water. Then he said that I should not touch the glass. I asked again why and he immediately told me that I am a pariah. Then I asked him what did he mean by this?

Interviewer: Do you mean to say that you have never heard of the term pariah before?

Student: No, never. I told this boy why you are talking like this to me. I wear clean clothes, I take bath in the morning, I am clean. But when he insists that I should not touch the glass I gave him a blow on his face. Immediately the boy howled and I also cried. He went to the class teacher and told him that I had beaten him. She asked me why and I told her that he told me to cup my hands because I am a pariah. She appeared embarrassed. I can very

of humiliation and indignities. These interviews have been full of theoretical as well as empirical insights. I am grateful to them for sharing some of their intimate and hurtful experiences with me. This particular conversation took place in early 1997.

well remember the situation. I cried for a long time and after that I did not talk to anybody and nobody talked to me. The old aayah of the school took me home.

Interviewer: Then...

Student: When I saw my father I broke down again and shouted: 'Why did you bring me here? Why here?' My father told me many things later but at that point of time he said nothing, absolutely nothing.

This is what happened to him when he was eight years old and the feeling of humiliation, which time has not been able to erase, remains with him. At a seminar where I presented this, somebody asked whether this really happened to the interviewee or whether it was a later construction of an event in the light of contemporary political stirrings. I had no reason to doubt the integrity of my interviewee. That memory is a construction did not disturb me. I realised that the relationship between humiliation and the language needed to express it is always complex and often nourishes ambiguities. But this is no reason to despair as one is not really looking for a unique route to reach the pure source of such feelings. I was interested in mediations, not pure transparency. The question of the student, 'what brought me here' while going through the traumatic experience brings into focus the knowledge of a contrast as well as a larger context. The silence of the teacher, as of his father, were indeed loaded with cognitive elements.

Emotional experiences not only processes information pertaining to a concrete setting but also provides coherence to them. It makes visible certain relationships and helps several morally important features of a situation to emerge.<sup>7</sup> It is not surpris-

5. Hazari, *Untouchable: The Autobiography of an Indian Outcaste*. New York, 1969, pp. 140-141.

6. During the course of the last year I interviewed a few dalits regarding their experiences

7. For a discussion on emotion, see Ronald de Sousa, *The Rationality of Emotion*,

ing then that moral theorists have developed a greater appreciation of emotional experience and its contribution to moral and cognitive growth. This understanding of emotion, needless to say, militates against the view that treats it as either purely private or cognitively empty.

**I**n the process of reading the texts I was convinced that understanding indignities and humiliation is only possible once we confront these experiences frontally. It is no surprise that the representation of humiliation and pain is such a problematic issue of our times. As social theorists and citizens our responsibility lies in listening to the inchoate and muffled voices of humiliation. Why should we listen? What do we achieve when we pay attention to these experiences? This connects me to the next issue I am about to raise.

When somebody listens to the experiences of indignities of others a connection is established between the listener and the sufferer. A shared space is thus created, which is described in different ways by people. We as children of God, members of a political community are capable of repentance and transformation – all these are different articulations of the notion of a shared space mentioned above.

Kant, however, had a different emphasis. As bearers of 'reason', Kant argued, we deserve respect as well as owe it to others. Within the realm of ends he distinguished between two sets of things: one set which has a price and therefore can be exchanged and the other which is above all price and therefore cannot be exchanged.<sup>8</sup> In his discussion of dignity, Kant's accent is not really on the shared space that

people inhabit but on the separateness of individuals. To the extent solidarity among individuals is posited, it is abstract in its nature. The experiences of humiliation that the autobiographies so vividly represent are instances where the authors are wrenched away from a shared space. In other words, the presence of indignities forces the larger world to shrink. By listening to the voices of pain we allow the larger world to re-emerge. This has been pithily put by David B. Morris writing on pain: 'Suffering, in short, is not a raw datum, a natural phenomenon we can identify and measure, but a social status that we extend or withhold. We extend or withhold it depending largely on whether the sufferer falls within our moral community.'<sup>9</sup>

**H**umiliation, as I have pointed out earlier, fractures a shared world. It also forces the victims of indignities to fashion new solidarities. In the short term there is no doubt that the new solidarities have a positive impact on the political processes of our society. What happens in the long run to the victim's new-found solidarity is difficult to say. Although not discussed, it is important to remember that an understanding of indignities will be incomplete without discussing the violators of dignity. Due to a lack of space it has not been explored here. To map the collective dimension of indignities without obliterating the individual voices is the real challenge facing us. It also implies that our social science must change.

In his book *The Decent Society*,<sup>10</sup> Avishai Margalit defines a decent

edited by Carl J. Friedrich, The Modern Library, New York, 1949, pp. 180-183.

9. David B. Morris, 'About Suffering: Voice, Genre, and Moral Community', *Daedalus*, Winter 1996, p. 40.

10. Avishai Margalit, *The Decent Society* (translated from Hebrew by Naomi Goldblum).

society as one in which institutions do not humiliate people. In contrast, a civilised society is defined as one in which people do not humiliate one another. The fine distinction drawn by the author may be of some analytical value but in most cases the line that separates the two is rather thin. In a decent society, according to Margalit, the institutions do not rob people of their honour. They do not diminish a person's reason for self-respect. Finally they do not reject persons from the human commonwealth. This is not the place to discuss the book at length. Yet the author's attempt to put the issues of decency and humiliation at the centre of our concern (both as intellectuals and citizens) is indeed laudatory.

In different ways Ambedkar and Gandhi had raised the questions of dignity and decency in their writings. With hindsight one can say that Ambedkar's main objective was to create a decent society in India with the help of new institutions and by refashioning old ones. In contrast, one may locate Gandhi's enterprise primarily as one of creating a civilised society.

**M**y purpose here is not to put these two complex thinkers in two neat boxes. Ambedkar's conversion to Buddhism towards the end of his life and Gandhi's disillusionment with the social reality in the midst of the post-partition communal carnage show that in different ways both have articulated the need for a decent and civilised society. Humiliation does not disappear just because social scientists do not talk about it. I am sure that through the act of writing one can 'gain a hold' over it. This I consider as a crucial beginning.

Cambridge, Massachusetts. 1996. For an interesting discussion on the book see *Social Research*, Spring 1997.

# A dalit feminist standpoint

SHARMILA REGE

THE feminism that developed in the 1970s differed from the left in three crucial areas – the categories of woman, experience and personal politics, all of which were central to feminist theorisation. Though powerful as political rhetoric these categories posed theoretical problems. The category 'woman' was conceived as being based on the collective state of women being oppressed by the fact of their womanhood. As the three categories were deployed in combination it often led to exclusions around race, class, caste and ethnicity.

Since many of the vocal feminists of the 1970s were white, middle class and university educated, it was their experience which came to be universalised as 'women's experience.' Thus, sweeping statements such as 'all women are niggers' and 'all women are dalits' were made. The

ambivalence of the left towards women's issues was thus countered by an assertion that women essentially connected with other women; the 'subjective experiences of knowledge' became the basis of the theorising universal experience of womanhood. 'Experience' thus became the base for personal politics as well as the only reliable methodological tool for defining oppression.<sup>1</sup> From such an epistemological position, there was either a complete invisibility of the experiences of dalit women or at best only a token representation of their voices. There was thus a masculinisation of dalithood and a savarnisation of womanhood, leading to a classical exclusion of dalit womanhood.

The 1970s and early '80s were times of the 'reinvention of revolution'<sup>2</sup> and saw the emergence of several organisations and fronts – the Shramik Mukti Sanghatana, Satyashodhak

\* A more detailed version of the paper was first presented at a seminar organised by the Vikas Adhyayan Kendra in March 1998 at Pune and published in their journal *Vikalp*. It is part of a larger ongoing project and in that sense is not final. The paper draws upon our understanding of and engagement with the contemporary women's movement in Maharashtra.

1. Judith Grant, *Fundamental Feminism*, Routledge, New York.

2. For a detailed account of the emergence and politics of the different organisations and fronts in Maharashtra, see Gail Omvedt, *Reinventing Revolution: India's New Social Movements*, Sharpe, New York.

Communist Party, Shramik Mukti Dal, Yuvak Kranti Dal – all of which did not limit the dalit women to a token inclusion; their revolutionary agenda, in different ways, accorded a central role to dalit women. This was, however, not the case with the two other movements of the period – the Dalit Panthers and the women's movement as constituted mainly by the left party based women's fronts and the newly emergent autonomous women's groups. The Dalit Panthers did make a significant contribution to the cultural revolt of the 1970s, but both in their writings and their programme, dalit women remained firmly encapsulated in the roles of the 'mother' and the 'victimised sexual being'.

**T**he left party based women's organisations highlighted economic and work related issues as also helped develop a critique of the patriarchal, capitalist state. The autonomous women's groups politicised and made public the issue of violence against women. Though this led to serious debates on class versus patriarchy, these formations did not address the issue of Brahminism. While for the former 'caste' was contained in class, for the latter, the notion of sisterhood was pivotal. All women came to be conceived as 'victims' and therefore 'dalit', resulting in a classical exclusion. (All 'dalits' are assumed to be male and all women 'savarna'.) It may be argued that since the categories of experience and personal politics were at the core of the epistemology and politics of the Dalit Panther and the women's movement, this resulted in a universalisation of what in reality was the middle class, upper caste women's experience or alternatively the dalit male experience.

The autonomous women's groups of the early 1980s remained

largely dependent on the left framework even as they challenged it. As the women's movement gathered momentum, sharp critiques of mainstream conceptualizations of work, development, legal processes and the state emerged leading to several theoretical and praxiological reformulations. Debates on class versus patriarchy were politically enriching for both parties to the debate. It must be underlined that many of the feminist groups broadly agreed that in the Indian context a materialistic framework was central to the analysis of women's oppression. However, in keeping with their roots within the 'class' framework, they made greater effort to draw commonalities across class than caste or community.

This is apparent in the major campaigns launched by the women's movement during this period. The absence of an analytical frame, which in the tradition of Phule and Ambedkar viewed caste hierarchies and patriarchies as intrinsically linked, is apparent in the anti-dowry, anti-rape and anti-violence struggles of the women's movement.

**A**n analysis of the practices of the caste basis of violence against women reveals that while the incidence of dowry deaths and violent control and regulation of their mobility and sexuality by the family is frequent among the dominant upper castes, dalit women are more likely to face the collective and public threat of rape, sexual assault and physical violence at the work place and in public.

Consider the statements issued by the women's organisations during the Mathura rape case. While the NFIW looked at rape in 'class' terms, the socialist women talked in terms of the 'glass vessel cracking' and therefore in terms of loss of honour, and the AWC provided psychological expla-

nations of the autonomous women's groups highlighting the use of patriarchal power.<sup>3</sup> Looking back at the anti-rape agitation, it is apparent that the sexual assaults on dalit women in Marathwada during the 'namantar' movement did not become a nodal point for such an agitation, in fact they come to be excluded. The campaign therefore became more of a single issue one.

**C**onsider also the campaign against dowry. While the left women's organisations viewed dowry in terms of the ways in which capitalism was developing in India, the autonomous women's groups focused on patriarchal power/violence within the family. The present practices of dowry need to be viewed in the context of processes of Brahmanisation and their impact on marriage practices. That the Brahmanic ideals led to a preference for dowry marriage is well documented. In fact it was the colonial establishment of the legality of the Brahma form of marriage that institutionalised and expanded the dowry system. The Brahmanising castes adopted the Brahma form of marriage over the other forms and thereby established 'dowry' as an essential ritual.<sup>4</sup> Moreover, the principle of endogamy and its coercive and violent perpetuation through collective violence against inter-caste alliances are crucial to the analysis of dowry.

The relative absence of caste as a category in the feminist discourse on

3. For a detailed account see Supriya Akerkar, 'Theory and Practice of Women's Movement in India', *Economic and Political Weekly*, Vol. 30, no. 17, 1995, WS 2-24.

4. See Sharad Patil, *Dasa-Shudra Slavery*, 1982, Allied Publishers, Bombay. This text is significant to all those seeking to develop a non-Brahmanical feminist historiography. It is rather unfortunate that there has been little debate on the text and it remains outside the mainstream feminist discourse.

violence has also led to the encapsulation of the Muslim and Christian women within the understanding of 'talaq' and 'divorce'. In retrospect, it is clear that while the left party based women's organisations collapsed caste into class, the autonomous women's groups collapsed caste into sisterhood, both leaving Brahminism unchallenged. Though the movement did address issues concerning women of the dalit, tribal and minority communities and has made substantial gains, a feminist politics centring around the women of the most marginalised communities could not emerge.

**T**he history of agitations and struggles of the second wave of the women's movement is a history of articulations of strong anti-patriarchal positions on different issues. Issues of sexuality and sexual politics, which are crucial for a feminist politics, remained largely within an individualistic and lifestyle frame. Since issues of sexuality are intrinsically linked to caste, addressing sexual politics without challenging Brahminism results in lifestyle feminism. During the post-Mandal agitations and the caste violence at Chunduru and Pimpri Deshmukh in Maharashtra, women of the upper castes were invoked as feminist subjects – assertive, non-submissive and protesting against injustice done to them as women and as citizens.

In the anti-Mandal protests young middle class women declared that they were against all kinds of reservations (including those for women); they mourned the death of merit and explicated that they were out to save the nation.<sup>5</sup> At Pimpri

Deshmukh in Maharashtra, following the brutal killing of a dalit *kotwal* (also an active mobiliser for the local Buddha Vihar) by upper caste men, upper caste women publicly complained that he had harassed them and was sexually perverted. They claimed to have incited their men to protect their honour, thereby invoking the agency of upper caste women. The issue was not merely one of molestation or of violence against dalits, but one that underlines the complex reformulations that Brahmanical patriarchies undergo in order to counter collective dalit resistance.

The increasing visibility of dalit women in power structures as sarpanch, as members of the panchayat and in the new knowledge-making processes (such as Bhanwari Devi's intervention through the Saathin programme) has led to an increased backlash against dalit women. The backlash is expressed through a range of humiliating practices and often culminates in rape or the killing of their kinsmen. Such incidents underline the need for a dialogue between dalit and feminist activists since inter-caste relations at the local level may be mediated through a redefinition of gendered spaces. The emancipatory agenda of the dalit and women's movements will have to be sensitive to these issues and underline the complex interplay between caste and gender as structuring hierarchies in society.

**I**n times of globalisation and Hindutva, gender issues are being appropriated as cultural issues. This calls for a reformulation of our feminist agenda, to reclaim our issues and reconceptualise them such that feminist politics poses a challenge to the caste/class conceptualisation of Brahmanical Hindutva. Such a re-conceptualisation calls for a cri-

tique of Brahmanical hierarchies from a gender perspective. Such critiques have the potential of translating the discourse of sexual politics from individual narratives to collective contestations of hierarchies. In the Brahmanical social order, the caste based and sexual divisions of labour are intermeshed such that elevation in caste status is preceded by the withdrawal of women of that caste from productive processes outside the private sphere. Such a linkage operates on presumptions about the accessibility of the sexuality of lower caste women because of their participation in social labour. Brahminism in turn locates this as a failure of lower caste men to control the sexuality of their women and underlines it as a justification of their impurity. Thus gender ideology legitimises not only structures of patriarchy but also the very organisation of caste.

**D**rawing upon Ambedkar's analysis, caste ideology (endogamy) is the very basis of the regulation and organisation of women's sexuality. Hence caste determines the division of labour, both sexual division of labour and division of sexual labour. Brahmanisation is a two way process of acculturation and assimilation and throughout history there has been a Brahmanical refusal to universalise a single patriarchal mode. Thus the existence of multiple patriarchies is a result of both Brahmanical conspiracy and of the relation of the caste group to the means for production. There are therefore both discrete (specific to caste) as well as overlapping patriarchal arrangements.

Hence women who are sought to be united on the basis of systematic overlapping patriarchies are nevertheless divided on caste/class lines and by their consent to patriarchies and their compensatory structures. If feminists

5. See Susie Tharu and Tejswani Niranjana, 'Problems for a Contemporary Theory of Gender in India', *Social Scientist*, Vol. 22, March-April 1994.

have to challenge these divisions, their mode of organisation and struggles 'should encompass all of the social inequalities that patriarchies are related to, embedded in and structured by.' 'Does the recent assertion of different voice of dalit women challenge these divisions? A review of the non-Brahmanical renderings of women's liberation in Maharashtra is called for.

**I**n the 1990s, there were several independent and autonomous assertions of dalit women's identity; a case in point is the formation of the National Federation of Dalit Women and the All India Dalit Women's Forum. At the state level, the Maharashtra Dalit Mahila Sanghatana was formed in 1995. A year earlier, the women's wing of the Bharatiya Republican Party and the Bahujan Mahila Sangh set up the Bahujan Mahila Parishad. In December 1996, at Chandrapur, a 'Vikas Vanchit Dalit Mahila Parishad' was organised and a proposal to commemorate 25 December (the day Ambedkar set fire to the *Manusmriti*) as *Bharatiya Stree Mukti Divas* was advanced. The Christi Mahila Sangharsh Sanghatana, an organisation of dalit-Christian women was established in 1997. Though these organisations have advanced different non-Brahmanical ideological positions, they have come together on several issues such as the celebration of the Bharatiya Shree Mukti Divas and on the issue of reservations for OBC women in parliamentary bodies.

The emergence of autonomous dalit women's organisations has led to a major debate, sparked off by the essay 'Dalit Women Talk Differ-

ently'.<sup>7</sup> A series of discussions around the paper were organised in Pune by different feminist groups. A two day seminar was also organised by Alochana, Centre for Research and Documentation on Women, in June 1996. Subsequently, two significant responses to the emergence of autonomous dalit women's organisations – one by Kiran Moghe of the Janwadi Mahila Sanghatana and the other by Vidyut Bhagwat – presented the issues at stake. At the seminar, Gopal Guru argued that to understand the dalit women's need to talk differently, it was necessary to delineate both the internal and external factors which have a bearing on this phenomenon.

**H**e located their need to talk differently in a discourse of dissent against the middle class women's movement, as also the dalit male movement and the moral economy of the peasant movements. In a note of dissent, he argued against their exclusion from both the political and cultural arenas. He further underlined that social location determines the perception of reality and therefore the representation of dalit women's issues by non-dalit women was less valid and less authentic. Though Guru's argument is well taken and we agree that dalit women must name the difference, a privileging of knowledge claims on the basis of direct experience as authentic may lead to a furthering of narrow identity politics. Such a narrow frame may well limit the emancipatory potential of the dalit women's organisations as also their epistemological standpoints.

Though the left party based women's organisations have viewed the emergence of autonomous women's organisations as a setting up of a sepa-

rate hearth, they feel that Hindutva and the new economic policy have brought both formations closer, that the autonomous women's groups have once again come to share a common platform with the left. The subtext of the argument is that autonomy *ipso facto* is limiting, and that the dalit women's autonomous organisations would face a threat from the masses in case they did not retain the umbilical relation with the Republican Party. In such a context, their efforts would be limited by the focus on the experiential and the intricacies of funding.

**I**n a critique of Moghe's position, Bhagwat argued that her position was lacking in self-reflexivity and that the enriching dialectics between the left parties and the autonomous women's groups had been overlooked in highlighting only one side of the story. To label any new autonomous assertion from the marginalised as 'identitarian and limited to experience', she argues, is to overlook the history of struggles by groups to name themselves and their politics.

Several apprehensions were raised about the Dalit Mahila Sanghatana's likelihood of becoming a predominantly neo-Buddhist women's organisation. Pardeshi rightly argued that such apprehensions were insensitive and overlooked the historical trajectory of the growth of the dalit movement in Maharashtra. Yet she also cautioned that a predominantly neo-Buddhist, middle class leadership could have politically limiting consequences. For instance, she argued that at many of the proceedings of the Parishad, Brahmanisation came to be understood within a narrow frame of non-practice of trisaran and pan-chasheel. Such a frame could limit the participation by middle caste women.<sup>8</sup>

6. Kumkum Sangari's analysis of multiple and discrete patriarchies has been a significant contribution to feminist theorisation in the Indian context. See Kumkum Sangari, 'Politics of Diversity: Religious Communities and Multiple Patriarchies', *Economic and Political Weekly*, 23 December 1995.

7. Gopal Guru, 'Dalit Women Talk Differently', *Economic and Political Weekly*, 14-21 October 1995, pp. 2548-49.

There are as of today, at least three major contesting and overlapping positions which have emerged from the struggles and politics of dalit women in Maharashtra. The earliest well-defined position is the Marxist/Phule/Ambedkarite position of the Satyashodak Mahila Sabha.<sup>9</sup> A position emerging out of the dalit-bahujan alliance is that of the Bahujan Mahila Mahasangh (BMM) which critiques the Vedic Brahmanical tradition and seeks to revive the bahujan tradition of the 'adimaya'.

**I**t criticizes the secular position as Brahmanical and individualistic and underlies the Ambedkarite conceptualization of dhamma in community life. It opposes the common civil code and upholds customary law and community based justice. Significantly, the BMM seeks to combine both the struggle for political power and a cultural revolution in order to revive and extend the culture of bahujans.<sup>10</sup> Such a position is crucial to the problematisation of the dominant Brahmanical culture and thereby underlines the materiality of culture. Yet it faces the danger of glorifying bahujan familial and community practices, since all traces of patriarchal power are negated by viewing them as a result of the processes of Brahmanisation.

8. The issue was debated in the Sunday edition of *The Maharashtra Times*, Mumbai, 7 and 15 September, and in the *Samaj Prabhodan Patrika*, April-May 1996. A detailed discussion on Ambedkar and the question of women's emancipation in India is found in *Dr. Ambedkar ani Stree Mukti Vaad* by Pratima Pardeshi, 1997. An English translation has been published by the Women's Studies Centre, University of Pune.

9. For more details see Sharad Patil, *Marxvaad - Phule-Ambedkarvaad*, Sugava Prakashan, Pune, 1994.

10. Rekha Thakur, *Adimayachi Mukti*, Prabuddha Bharat Publications, Mumbai, 1996.

The Dalit Mahila Sanghatana has criticized the persistence of 'manuvadi sanskriti' in the dalit male who otherwise traces his lineage to a Phule-Ambedkarite ideology. The Sanghatana proposes to foreground the most dalit of dalit women in its manifesto. The Christi Mahila Sangharsh Sanghatana, a dalit Christian women's organisation, in its initial meetings debated the loss of traditional occupations of the converts, their transfer to the service sector, the hierarchies among the Christians by caste and region, and the countering of oppositional forces led by the church and state level Christian organisations.

**T**hese non-Brahmanical renderings of feminists politics have contributed to some self-reflexivity among the autonomous women's groups. Their responses can be broadly categorised as (a) a non-dialectical position of those who while granting that though historically it is now important that dalit women assume leadership, do not revision a non-Brahmanical feminist politics for themselves; (b) the left position which collapses caste into class and continues to question the distinct materiality of caste and has registered dissent to the declaration of 25 December as Bharatiya Stree Mukti Divas; (c) a self-reflexive position of those autonomous women's groups who recognise the need to reformulate and revision feminist politics since the non-Brahmanical renderings are viewed as more emancipatory. It is apparent that the issues underlined by the new dalit women's movement go beyond the naming of dalit women and call for a revolutionary epistemological shift to a dalit feminist standpoint.

The intellectual history of feminist standpoint theory can be traced to insights provided by Marx, Engels

and Lukacs into the standpoint of the proletariat. A social history of standpoint theory focuses on what happens when marginalised peoples begin to gain public voice. The failure of dominant groups to critically and systematically interrogate their privileged position leaves them crippled, scientifically and epistemologically. A dalit feminist standpoint is viewed as emancipatory since the subject of its knowledge is embodied and visible (i.e. the thought begins from the lives of dalit women and these lives are present and visible in the results of the thought). This position claims a higher emancipatory status than other positions and counters pluralism and relativism which posit all knowledge-based and political claims as valid in their own way.

**I**t emphasises individual experiences within socially constructed groups and focuses on the hierarchical, multiple, changing structural power relations of caste, class and ethnicity which construct such groups. It is obvious that the subject/agent of dalit women's standpoint is multiple, heterogeneous and even contradictory, i.e., the category 'dalit woman' is not homogenous. Such a recognition underlines the fact that the subject of dalit feminist's liberatory knowledge must also be the subject of every other liberatory project and this requires a sharp focus on the processes by which gender, race, class, caste, and sexuality all construct each other. Thus, the dalit feminist standpoint itself is open to liberatory interrogations and revisions.<sup>11</sup>

11. The discussion on feminist standpoint epistemology is largely influenced by Sandra Harding, 'Subjectivity, Experience and Knowledge: An Epistemology from/for Rainbow Coalition Politics', in J. Pieterse (ed), *Emancipations: Modern and Postmodern*, Sage, New Delhi, 1991.

The dalit feminist standpoint which emerges from the practices and struggles of dalit women may originate in the works of dalit feminist intellectuals, but it cannot flourish if it is isolated from the experiences and ideas of other groups and must educate itself about the histories, preferred social relations, the utopias and the struggles of the marginalised. A transformation from 'their cause' to 'our cause' is feasible for subjectivities *can* be transformed. By this we do not argue that non-dalit feminists can 'speak as' or 'for the' dalit women but they can 'reinvent' themselves as dalit feminists. Such a position, therefore avoids the narrow alley of direct experience based 'authenticity' and narrow 'identity politics'.

For many of us, non-dalit feminists, such a standpoint is more emancipatory in that it rejects more completely the relations of rule. Thus, adopting a dalit feminist standpoint position means sometimes losing, sometimes revisioning the 'voice' that we as feminists had gained in the 1980s. This process, we believe, is one of transforming individual feminists into oppositional and collective subjects.

# On a dalit woman's testimonio

M. S. S. PANDIAN

In fact, nostalgia and remembering are in some sense antithetical, since nostalgia is a forgetting, merely regressive, whereas memory may look back in order to move forward and transform disabling fictions to enabling fictions, altering our relation to the present and future.<sup>1</sup>

Emphasising popular, oral discourse, the witness portrays his or her own experience as an agent (rather than a representative) of a collective memory and identity. Truth is summoned in the cause of denouncing a present situation of exploitation and oppression or in exorcising and setting aright official history.<sup>2</sup>

THE arrival of dalit literary criticism and dalit literature in Tamil, which more or less coincided with the birth centenary celebrations of Ambedkar, occasioned much anxiety and rage among the gate-keepers of the literary establishment. It was not an unpredictable moment when both the right and the left of the literary establishment joined hands in reviling this new corpus of writing which marked itself out as distinctly dalit and, through multiple and hitherto unavailable modes of interrogation and re-readings, rendered vulnerable and uncertain the received commonsense about what is sacred and profane in literature. Scurrying around for newer defences, the literary establishment labelled this new literary discourse as anarchist and divisive.<sup>3</sup>

2. George Yudice, 'Testimonio and Postmodernism', *Latin American Perspectives*, vol. 18, no. 3, Summer 1991.

3. For an account of the hostility towards dalit literary criticism and dalit literature in Tamil Nadu by the literary establishment, see

Contestation being its lifeline, dalit literary discourse could not but proliferate in the face of such hostility. After an unconventional expedition into the much-acclaimed landscape of Tamil classical literature, Raj Gowthaman returned with untold tales of other truths. If certain invocation of aesthetics had earlier recovered this body of literature as a sign of Tamil accomplishment, Gowthaman unearthed in it sordid, demeaning representations of dalits and their cultural universe. What is more, the flipside of its high-flown moralising and cannons of proper living was, for him, none other than a technology of inferiorising and disciplining the recalcitrant underprivileged—those who were outside the caste society, women and so on.<sup>4</sup> As much as the literature of the so-called classical era, contemporary Tamil literature too could no longer find the going easy. Pudumaipithan's prose and fiction, bloodied in the new literary confrontation, could no longer circulate as unproblematic texts of rebelliousness.<sup>5</sup>

5. A. Marx, 'Pudumaipithanin Pirathigalil Dalithugal, Maravarkal, Krishnavarkal,

It is in this milieu where the certitudes of the past looked feeble, Bhama's *Karukku*, perhaps the first dalit testimonial narrative in Tamil, was published in 1992, to be quickly followed by a reprint in 1994.<sup>6</sup> In *Karukku*, Bhama describes her village, her childhood, her world of labour, education in different institutions, the annoying presence of casteism encountered in them, her Christian upbringing, her growing awareness of the play of caste among the clergy and the congregation, joining the Catholic order as a nun, and her disenchantment and parting of ways with the same. While such a synopsis of Bhama's text would impoverish it to resemble a regular autobiography, it is indeed not an autobiography. As Mark s.j. mentions in his foreword to *Karukku*, 'At the first sight it reads like a history of a village. From another angle, it reads like an autobiography. From yet another angle, it reads like a brilliant novel.' In other words, Bhama's is a case of willfully violating genre boundaries.

This act of violating genre boundaries is where Bhama's narrative, even as it verbalises her own life story, depletes rather effortlessly the autobiographical 'I', an outcome of bourgeois individualism, and displaces it with the collectivity of the dalit community. Her story, to put it differently, refuses to be her own but that of others too. *Karukku* achieves this through a range of textual strategies.

**F**irst of all, Bhama's narrative, to a great degree, does not deal with herself, but the context of dalit life in which she grew up and acquired a certain self-awareness. Her descriptions

of her childhood and the world of dalit labour, which constitute a substantial part of her narrative, are marked for the most part by a compelling absence of herself. In *Karukku*, Bhama's childhood comes to life in a series of cameos on collectivity—childhood games which *they* played and left behind at different stages of their lives, the festivities of the Christian calendar—Easter, Christmas and New Year—in which *they* partook year after year with much excitement, sharing of game meat brought to the village by men who habitually forayed into the adjacent hills accompanied by hunting dogs and so on.

**B**hama's account of the world of dalit labour, in the same vein, journeys through a generalised, but detailed, description of diverse forms of arduous, underpaid and unpaid jobs that dalit men and women perform—ploughing, manuring, sowing, weeding, harvesting, digging wells, collecting firewood, baking bricks and so on. In this thick description, which interweaves righteous anger at the downgrading of exacting physical labour and simultaneous pride in the skill involved in it, Bhama's own presence as a child getting bruised while collecting firewood in the forest or dehusking groundnuts for the landed Naicker families during school vacation is merely anecdotal. It is as though the autobiographical 'I' does not have an autonomous life outside the collective 'we'.<sup>7</sup>

This absence of 'I' gets its further affirmation in the polyphony of other voices from the dalit community which saturate *Karukku*. When Bhama was eleven, she witnesses the battle-like confrontation in the local cemetery between the dalits of her village

and the upper caste Saliyars, the consequent raids by policemen, dalit men escaping into safety in the forests and the hills, and deaths due to police brutality. The narration of this childhood event, which occupies considerable space in the book, is a telling instance of how Bhama's text, instead of privileging her own voice, functions as a site for the criss-crossing of multiple voices from within her community.

**W**e, as much as Bhama, learn from her grandmother what the police would do to the arrested men. It is the whispers of women overheard by Bhama which informs us of the fate of the dalits in the hands of the policemen, and we get a feel of dalit anger at the cowardice of the Saliyars from the words—swear words included—of Thavasi Kelavi, an old woman. And finally it is a series of quotations from unnamed members of the village which discloses to us the mood of celebration and stock-taking when the verdict of the court goes in favour of the dalits. Bhama's is, thus, one among a community of voices.

At another level the strategy of erasing specificities by masking them with a veil of anonymity, lifts the narrative from the local and turns it into a universal statement about oppression. The village in *Karukku* goes unnamed; those upper caste Saliyars who attacked the dalits in her childhood days go unnamed; the dalit headman, who hid himself in their

Matrum Idara Mamisa Padchinigal', in P. Krishnaswami (ed.), *Pudumaippithan Illakiya ithadam*, Kaaviya, Bangalore, 1995.

6. Bhama, *Karukku*, Samudaya Sinthanai Seyal Aaivu Mayyam, Madurai, 1994.

7. On the essential feature of *testimonio* as of the community and not of the individuated self, see Georg Gugelberger and Michael Kearney,

'Voices for the Voiceless: Testimonial Literature in Latin America', *Latin American Perspectives*, vol. 18, no. 3, Summer 1991; George Yudice, 'Testimonio and Postmodernism'; and John Beverley, 'The Margin at the Centre: On Testimonio (Testimonial Narrative)', in Sidonie Smith and Julia Watson (ed.), *Decolonising the Subject: The Politics of Gender in Women's Autobiography*, University of Minnesota Press, Minneapolis, 1992.

house to escape the raiding policemen, goes unnamed; the village priest, an upper caste partisan, goes unnamed; the schools and the college where she studied and suffered caste go unnamed; the nunnery and its residents, once again steadfast believers in caste, go unnamed.

To name is to exercise power. But a deliberate refusal to name can enable a politics of collectivity. In this case, the shroud of anonymity frees events, persons and institutions from the possibility of individuation and renders them as general. Anonymity thus becomes a mode of invoking larger solidarities. In contrast, those who get named in *Karukku* are the ones who are so ordinary that they would be part of the dalit community anywhere else: Ponthan, the consummate thief who could dodge even the *ayyankatchi padai* (the marching battalion of demons, big and small); Kaaman, the village idiot whose skill in making gruel is as good as that of any woman; Oodan, a habitual wife-beater who could tease his flute into brilliant music, and so on.

**H**owever, the very life trajectory of Bhama is one of drifting away from the world of dalits. Access to modern education, salaried employment and the material comforts of the nunnery, which takes her away from the world of physical labour and struggle for livelihood, are some of the moments of this deep alienation. In narrating these events, *Karukku* is suffused with a sense of guilt, a yearning to reunite with the community, and a burning desire to share its pains and pleasures. Bhama's conscious choice of spoken dalit Tamil, ungoverned by the tyranny of elaborate grammatical rules, as the medium to voice the story of her community is indeed instructive. In a spirit of defiance, it obviously challenges the authority of literacy over

orality, a divide which was ratified and nourished by Tamil Saivism or Tamil nationalism of different hues, including mainstream Dravidianism, during this century.<sup>8</sup> But at an equally important plane, it is an effort by Bhama to break free from her proficiency in standardised written Tamil, a result of her privileged education in schools and colleges, and to lose herself in the community of dalits.

A similar quest is all too evident when Bhama narrates her other moments of alienation from the dalit community. After detailing how her salaried job earned her the opportunity to indulge a bit in clothes, food and travel—all of which remained an elusive dream till then—and her new feeling of power and status, she laments about her community: 'How would they ever get these comforts?' This sense of remorse withers and gives way to a feeling of meaningful freedom only when she discards her job and the material pleasures of the Catholic order and returns to her own community. In a metaphor reminiscent of Maoist guerrillas, Bhama eloquently captures this return to freedom thus: 'After fluttering like a fish thrown out of water, now I breathe freely and comfortably like a fish in water.'

**W**hile *Karukku* is anchored in the shared universe of the dalits, this universe is, for Bhama, unworthy of any indiscriminate nostalgia. She, instead, looks for a future fashioned by the will of the dalits themselves. The very word *Karukku*, which she chooses as the title for her *testimonio*, signals this desire. *Karukku* is the saw-like double-edged stem of the palmyra leaf. Bhama has experienced the pains

8. For similar argument, see John Baverley, 'The Margin at the Centre', p. 97; and George Yudice, 'Testimonio and Postmodernism', p. 17.

of being torn by '*karukku*' while collecting firewood in her childhood. Then it can perform other functions as well: 'Dalits like me are fired by the desire to construct a new world of justice, equality and love. Like the double-edged *karukku*, they keep the oppressors slashed.' To put it differently, *karukku* signifies both the oppressive present and the struggle against it, a metaphor which connects the present with the future.

**T**he way in which Bhama unfolds the story of her growing up with Christianity and the eventual disenchantment is yet another illustration of her search for dalit agency. In childhood it was the fear of god which dominated her religious consciousness. When she left her village to join a high school, this fear metamorphosed into an intense love. As she went to college, she was overcome with a certain sense of indifference towards god—but for those times of difficulties when she solicited divine intervention. If she joined the Catholic order as a nun, it was inspired by an ambition to serve the dalits. Her discovery of barefaced casteism within the church and upper caste repression in the name of obedience led her to wonder, 'I don't know where the god has fled. For now, it is the priests, nuns and their relatives who claim themselves to be gods.'

Now on, she is in pursuit of a religiosity unmediated by the clergy. The hardships, insults and desertion by friends, which followed her after she left the Catholic order, made her despair. In the closing pages of the book she, uncharacteristically, describes herself as vulnerable as a bird with broken wings. But this moment of vulnerability is simultaneously a moment of reunion with her community in search of a liberative religiosity. She writes, 'They have understood

that they have been also created in the image of god. They have a new drive to bring back this image which has been broken and destroyed, and to live in compassion and honour. I feel that this is genuine devotion.'

Given Bhama's location as a woman within the dalit community, the invocation of community and agency in terms of a singular dalit identity is telling the story in part. Articulating concerns of gender even while recovering community as an embodiment of identity and agency would necessarily require complex negotiations. This is where Bhama's testimonio appears inadequate.

It is not that gender does not animate *Karukku*. Bhama recounts with gusto the stories of women's indomitable courage and prowess during those hard days of police raids: the story of the women who kept the policemen away from her house by hanging margosa leaves at the door which announced the presence of small pox – in this case falsely – so that her husband could stay with her; the story of her own grandmother who could hatch and execute the ingenious plan of dressing up a man in a saree so that he could escape police vigil and attend his son's funeral. We also hear about the sexual abuses hurled at women by policemen and the unintelligibility of why men are paid more than women for the same labour. But all of these fleet through the text as if they are mere fragments of a larger story. We are left to imagine the gender relations within the community.

Are we to take it as a sign of greater equality between genders within the dalit community? Or is it that Bhama deliberately refuses us the story and holds it as a secret in the face of onslaughts on her community? Only she can tell. In making us wait, she is perhaps once again asserting her own will and that of her community.

# A question of quotas

DIPANKAR GUPTA

MOST Indians do not realize that our country is not unique in having a reservation policy. In many modern nation states, and not all of them are terribly democratic, there is some form of affirmative action or reservation policy. In Malaysia reservation exists for the Malay *bhoomiputra*, in Pakistan for bringing a fairer representation among the various provinces, in Northern Ireland for the Catholics, and in North America for blacks and native Indians. India is probably the first country in the world to devise constitutional reservations, but there are many others who now have their own form of preferential policy in place.

That some form of reservation or affirmative action exists in many countries should not blind us to the many differences that exist between them. It is true that communities as diverse from one another as the Malays, the Irish Catholics and the Mohawk

Indians may all be targeted beneficiaries of reservations or affirmative action, but the circumstances of their lives are quite different. The Malay *bhoomiputras* are the dominant political community in their own country, but depend on preferential policy to combat the prosperous Malays of Chinese origin in the urban sectors.<sup>1</sup> In Pakistan a kind of preferential employment exists so that different regions in the country feel represented.<sup>2</sup> Though the policy was originally intended to accommodate East Pakistan Bengalis, it continued to remain in effect even after the formation of Bangladesh. The Catholics in Northern Ireland may be persecuted, but they certainly do

not lack the skills and education necessary for being competitive in modern times.

The reservation policy as envisaged in the Indian Constitution, and affirmative action in the United States resemble each other the most. In both cases the express intention is to rely on preferential policy to uplift those communities that have been historically disprivileged. The scheduled castes and tribes in India and the native Indians and blacks in America have been victims of discrimination and prejudice for long periods of time. This prevented them from acquiring the educational and cultural skills necessary for economic success in contemporary societies. Skills, such as the ones they possessed, not only confined them to the lowest rungs in the traditional order, but did not power them to independently forge ahead when the old economy and its accompanying social relations were dismantled.

**M**odernization and industrialization did not, however, inaugurate the awareness that historical disprivileges need to be corrected. That sensitivity came with the deepening of democratic practices and sentiments. Early liberal philosophy was only committed to the market and to the curbing of monarchical authority. In John Locke, for instance, property qualifications still remained the basis for exercising franchise. Women were not recognized as being politically equal to men, and those who were not Anglican were not seen as full citizens and were accordingly prevented from occupying certain public offices. Liberty and equality had a much more restricted scope than what they enjoy today. When William Wilberforce and Lord Shaftesbury fought against slavery they met with serious opposition even in Britain. In 19th century

England the Chartists had to struggle to give women the right to vote.

Democracy in practice today is thus vastly different from what it was even till as late as the early decades of this century. The racist, 'separate but equal' clause operated in America, particularly in relation to educational institutions till as recently as 1954. Under this clause black children could be legally disallowed from attending schools meant for white children. Even after this provision was shot down in the justly famous *Brown vs. Board of Education* case in 1954, many southern states in America refused to implement it. Affirmative action first made its appearance during Kennedy's presidency, and even then it was not powered by legislation but by executive decrees.

**P**referential policies came up when it was recognised that liberty and equality do not necessarily mean the establishment of fraternity. If the triumvirate are to go together then there needs to be a self-conscious designing of political interventions such that those who have been historically disprivileged can get a fair chance to compete as equals. Obviously, such a programme recognizes unequal starting conditions for politically equal citizens which the forces of the market are generally blind to, and indeed may even exaggerate. Therefore, while such preferential policies do not disband the market, except in extreme 'socialist conditions', the attempt is to restrain the market in certain spheres so that eventually there can be a greater and fulsome market participation.

The introduction of preferential policies to uplift the historically disprivileged came about for different reasons in different countries. In America it was a combination of factors that brought it about. The growing civil rights movement, the Demo-

cratic party's striving for a political niché, and the ideological need that America felt to stand out as the leader of the free world in the Cold War era together led to the establishment of affirmative action. Preferential policy in Canada had a different trajectory and inspirational source. The divide between Quebec and the rest of Canada prompted the politics of multiculturalism around which provisions for equal rights opportunity and minority representation found their ideological rationale.

Though the reasons, provocations and compulsions to introduce reservations or affirmative action differ from country to country, the Indian case still remains unique because preferential policies were introduced here along with the inauguration of democracy and the founding of the republic. What took about 200 years to make a tentative appearance in the United States emerged fully articulated and theorized almost at the instant when India became a sovereign and democratic nation state.

**O**ne of the major reasons is, of course, to be found in the character of India's national movement. As the British authorities kept attempting to divide Indians along caste, religious and linguistic lines, it became all the more important for the protagonists of the national movement to rise above such fissures, present a united front, and not let community spokespeople be persuaded by colonial designs. This is what led to a heightened sensitivity among the nationalists to unite communities across lines drawn by caste prejudices and religious intolerance. This is why the establishment of quotas was never seriously opposed even though some, like Jawaharlal Nehru, were very sceptical about them.

A series of surveys conducted in America by a variety of agencies

confirm the finding that Americans of different socio-economic categories are united in their opposition to quotas. Blacks too find the quota system distasteful and would not like affirmative action linked to it. The Gallup poll of March 1991, the NBC/Wall Street Journal poll of March 1994, the L.A. Times poll of January 1995, as well as the poll conducted by the National Conference of Christians and Jews in March 1994, all confirm this tendency. American law too does not allow exceptions of any kind on the question of equal treatment for all unlike Indian law.<sup>3</sup>

**T**he fact that a constitutional amendment was easily made after the *Champakam vs. State of Madras* case of 1951 to accommodate caste based admissions and preferences is quite unthinkable in American jurisprudence. This is why whenever there is any sign of affirmative action infringing on individual rights, the courts in America generally rule against affirmative action. For example, the court upheld the petition that the Regents of California University had filed against race-based quotas in the famous Steve Bakke case. Subsequently, there have been whole slews of legal decisions that have stopped all considerations of quota in their tracks in America. These include landmark judgements such as *City of Richmond vs. Croon* in 1989, and *Miller vs. Johnson* in 1995.

Part of the resentment to quotas can be traced to the time when a kind of reverse quota system was in operation against the Jewish community. Till about the 1930s many universities had an informal quota system that restricted the number of Jewish students in their campuses. Now that Jews have

'become white folks'<sup>4</sup> the fact that such a practice was ever in place fills most Americans with revulsion. While this sentiment is genuine among most Americans, their opposition to quotas in the affirmative action programme is at a more fundamental level.

**I**n order to understand public policy and its implementation in America, it is important to pay attention to the emotive bonds that define what is it to be an American. This strategy holds equally for other nation states too. Thus to appreciate the complexities of, and the complicities behind, the reservation system in India it is necessary to have an idea of how this policy found its place in India's political and social firmament. Americans do not revere family wealth the way most Indians, or even Europeans, do. Many Americans even manufacture a 'rags to riches' story just to look good and be admired. For example, Sylvester Stallone had once invented a heart-wrenching penury to wealth fable about himself that so offended his upper middle class parents that they had to publicly deny it.

The strong individualism that is dramatized in these rags to riches narratives, in many ways brings to the fore how Americans generally perceive themselves. In popular recall, America was made by intrepid colonizers who by their sheer grit and valour tamed the West. In America too, the early settlers made sure that foppish old European ways, replete with old world status considerations, were not allowed to gain ground. This American vision of themselves was further reinforced during Cold War days. Communism was demonized effectively for it was portrayed as

being fundamentally antithetical to the foundational ethic of American individualism. As America is the land of the free and the brave it was duty and honour bound to resist communism and its collectivist ideology at home and abroad.

There are other ways too in which this individualist tendency is manifested and indeed encouraged. In America role models do not last for more than a generation. In fact parents are rarely idolized by their children, and each generation must find its own stars and templates. Roles such as those of husband and wife, father and mother are constantly being innovated upon. The drive to realize oneself and not to fall back on hand-me-down role models pressures Americans to find themselves and do their own thing, no matter in which walk of life they may be placed. If there is a high divorce rate in America it is not because couples there are sexually irresponsible as much as it is because they are looking for the ideal marriage as they see it.

**T**he work place too is a site for self-expression, just as much as Hollywood studios and the play fields are. It is not at all surprising that several leading figures in 20th century commerce and industry, from Henry Ford to Bill Gates, are from America. Some of the most path-breaking films are still American productions. In the sports arena, from basketball to boxing, America leads the way in innovative styles and superlative performances. Music is another industry that carries the imprint of American experimentation with a variety of genres—from blue grass, to jazz, to rock and roll. America's fashion industry too is very unlike its European counterpart. Whereas in France, for instance, fashion is created on the drawing board by eminent designers in *haute couture* fashion houses, distinctive

3. Thomas Sowell, *Preferential Policies: An International Perspective*, Walter Morrow and Co., New York, 1995, pp. 105-6.

4. Karen Bodkin Sacks, 'How Did Jews Become White Folks', in Steven Gregory and Roger Sanjek (eds.), *Race*, Rutgers University Press, New Brunswick, 1994, pp. 83-4.

styles in America emanate from the kind of gear young people wear when shuffling around in the mean streets of Chicago and New York. Quite like the marketing of jazz in the 1930s and 1940s, fashion innovations at the popular level were picked up by commercial houses, who then packaged and labelled them for a wider audience.

**S**een against this background it is not at all surprising that quotas should have such a difficult time in America. Title VII that backs up the affirmative action programme in the United States does not just stop at quotas. It goes further to say that affirmative action should not dilute standards in order to be more representative. The thinking behind this is obviously that preferential policies in America are there to remove prejudices that exist among individuals who are intrinsically equal. Compromising on standards would then be seen as a patronizing act, made worse by the fact that individual brilliance may cease to be rewarded.

What the affirmative action policy endorses is that, other things being equal, an effort should be made to encourage black and native Indian employment and school enrolment. The fact that the University of California had introduced a quota system, which expressly went against this formulation, led to the eventual dismantling of affirmative action with the passage of Proposition 209. Interestingly, Proposition 209 was placed by the Regents of the University of California at Berkeley and piloted by a leading black member of that committee.

It is tempting to see either the Indian or the American case as paradigmatic and the other as the exception to the rule. There are, however, some striking similarities in the two instances. In both America and India, the targeted community is a clear minority. Blacks make up about 12% of the

American population, whereas the scheduled castes and tribes constitute roughly 22% of India's population. Against this common feature it is worthwhile to factor in the various differences which can explain why quotas are so appealing in one case, and anathemic in the other. We have already said how individualism in America acts as a deterrent against quotas. Yet, to fully appreciate why this argument has won the day it is necessary to take into account some of the other specifics that separate these two countries.

**B**ut before we get down to these differences it needs to be mentioned that politics in India has always been acutely sensitive to community pressures. For example, during the Constituent Assembly debates, the sub-committee on fundamental rights observed that 'it is difficult to expect that in a country like India where most persons are communally minded, those in authority will give equal treatment to those who do not belong to their community'.<sup>5</sup> In fact on occasions the debates in the Constituent Assembly were so tilted in favour of community representation rather than individual rights that it prompted Alladi K. Ayyar to rebuke the members with the remark: 'Is this a chapter on fundamental rights or is it a chapter on discriminatory provisions.'<sup>6</sup>

The fear, quite obviously, in the minds of those like Alladi Ayyar, B.N. Rau, and Rajkumari Amrit Kaur was that such undiluted concern for community privileges would erode the status of the individual and make the community a perennial interest group. Anticipating this eventuality,

5. B.D. Shiva Rao (ed.), *The Framing of India's Constitution: Selected Documents* (vol. 2), Indian Institute of Public Administration, Delhi, 1968, p. 98.

6. Ibid., p. 22.

Ambedkar, while moving the draft constitution on 23 November 1948, commented rather explicitly that it would be 'equally wrong for minorities to perpetuate themselves.'<sup>7</sup>

**O**bviously, it is not enough to say that communities dominate India while the individual occupies the centre-stage in America. Such a statement needs to be fleshed out in terms of the social milieu that makes such sentiments dominant in their respective settings. When India became independent in 1947 the democratic world had moved way ahead of what it used to be even as late as in the opening decades of this century. Thus India was striding two time scales. On the one hand it could not turn its back on the centuries of progress that liberal thought and practice had introduced in the modern world, and at the same time it did not have the necessary institutional depth to abide by individualistic norms so characteristic of liberalism. While liberal societies realized the importance of self consciously boosting fraternity after approximately 200 years of democracy, India launched into preferential policies right away with the stroke of the constitutional pen the moment it became a republic.

In America preferential policies were initiated during the Kennedy years, advanced paradoxically by Richard Nixon, and began to atrophy from around the mid-1980s. Somehow they did not seem to possess the necessary ideological thrust for which reason they remain alive but sick; more kicked about than kicking. This is largely because America prides itself in being the home of the free in the sense that communities and religious affiliations could neither be

7. B.D. Shiva Rao (ed.), *The Framing of India's Constitution: A Study*. IIPA, Delhi, 1968, p. 677.

used as a source of strength, nor the focus of abuse.

The American Revolution, quite characteristically, brought disestablishment of churches in its wake. New York was the first state to be disestablished in 1777, followed by Virginia in 1785. Gradually the remaining states followed suit and in 1833, with the disestablishment of the Congregationalist church in Massachusetts, the process was complete in the entire country. In this entire series of spectacular reversals for the church it is true that the individual triumphed, but this was really possible because the Protestants amalgamated, for all practical purposes, as a single phalanx. As an overwhelming majority it set standards for the rest by depending, above all, on its unquestionable dominance in society.

To understand how this denouement eventually occurred is not central to this paper. Suffice it to say that women and clerics took the sting out of an angry and wrathful protestant religion and made it soft and forgiving.<sup>8</sup> At any rate the White Anglo-Saxon Protestants (WASPs) put their distinctive stamp on the American way of life and controlled the social and cultural life in the New World. Other communities became 'ethnics' against the backdrop of WASP homogeneity, and indeed, hegemony.

No wonder ethnics such as Italians, Greeks and even Jews, strove to shed their peculiarities and merge with the powerful and influential WASP majority. The effects of this tendency are clearly visible in America today, but the process began long ago. The interesting point in all this is how such a WASP majority was constituted by deliberately underplaying the doc-

trinal differences between the extant Protestant denominations such as the Episcopalians, Methodists, Baptists, Congregationalists, and so forth. Perhaps, as Ann Douglas suggests, 'ministers and mothers' had a great deal to do with this.<sup>9</sup>

In Europe and England, on the other hand, majority culture dominated largely because of religious intolerance and discrimination. In England, the home of democracy, non Anglicans suffered from all kinds of disadvantages. It was only after the Tests and Establishment Act was disbanded in the 1880s did Catholics become legally equal to Anglicans. The American route to majoritarianism was certainly more democratic in orientation but the fact still remains that minority consciousness was not on the agenda. When minority consciousness came about it was with reference to blacks and native Indians, but these communities were faced with a rather monolithic WASP majority whose social lifestyle and aesthetic preferences set the tone for the American way of life.

Thus even while Hollywood was dominated by Jews, the films they produced were all about WASPs. It is only now after Jews have become 'white folks' that the likes of Woody Allen have made the portrayal of Jews quite acceptable in American films. Movie stars like Paul Newman can now openly talk about their Jewish heritage. Not just in films, but in the academic world too it paid to be a WASP, or, at least to be perceived as one. The famous sociologist Robert K. Merton did not reveal his Jewish identity till well after he had retired. All through those years he put up the front of a quintessential WASP. No one suspected his real identity for he played the role of the WASP to the hilt.

9. Ibid.

The situation in India is vastly different. In some ways it could well be said that India was ahead of other democracies because it did not allow majoritarianism to congeal. At any rate, minority consciousness was dominant in the Indian political process from the beginning. The concern with scheduled castes and scheduled tribes is a sub-set of this minority consciousness. These communities were considered vulnerable not just because they were fewer in number, but also because they were historically prevented from acquiring skills and qualities that could enable them to prosper independently. This is why reservations is not really about protecting cultures but about raising the status of hitherto disprivileged peoples so that they can compete as equals and indeed be able to fight more effectively for rights guaranteed in the Constitution.

In America the presumption behind affirmative action is somewhat different. Preferential policy in this case is to combat prejudice that disallows otherwise qualified black people from occupying their rightful positions. This is why in America the principle of compensation animates affirmative action.<sup>10</sup> In India, on the other hand, it is not so much compensation but the *extirpation* of the caste system which is emphasized. This is because it is believed that the caste system left to itself would routinely bar members of certain designated castes from acquiring competitive skills of the market place.

Americans obviously tend to believe that there are qualified blacks around and it is only prejudice that stands in the way. It is for this reason that affirmative action activists too

8. Ann Douglas, *The Feminization of American Culture*, Avon Books, New York, 1977, pp. 18, 94 ff.

10. See M. Cohen, T. Nagel and T. Scanlon (eds.), *Equality and Preferential Treatment*, Princeton University Press, Princeton, 1977.

would not allow for dilution of standards. However, in India the reservation system is based on the conception that basic skills have to be developed before the hitherto underprivileged stand a chance to compete on their own. This is probably why quotas are so important here. Compensation works best when it is individually handed out. Further, compensation makes sense when the origins of discrimination are historically recent and in some ways today's advantaged sections feel guilty of the deprivations their forebears had subjected other communities to in the not too distant past.

**C**ompensation does not work in India because the origins of caste discrimination go too far back into the hoary past. Second, compensation is effective when the benefits are given out to those who can make full use of them as and when the situation presents itself. A compensation is never given out in advance but only after a case has been made out and the beneficiary is found to be worthy of receiving it. Compensations are generally graded depending upon a variety of circumstances, of which the claimants' qualifications count for a good bit. In India it is not the principle of compensation but that of extirpating the evils of the caste system that provided the ideological rationale for reservations.

It is for this reason that the founding figures of the Indian Constitution were keen that reservations should not be allowed in perpetuity, but reviewed every so many years. But reservations were given to the community and that is why the quota system and the dilution of standards for accommodating scheduled castes and tribes had to be entertained.

Why has the reservation system been allowed to last so long though the Constitution clearly stated that there should be periodical reviews? It is true

that the lot of scheduled castes and tribes has not changed sufficiently for the reservation system to be disbanded altogether. Nevertheless the fact is that there does not seem to be any political will to curb the wanton use of quotas in India. In my view the scheduled castes and tribes by themselves could not have brought about such a political sentiment on their own. Quotas have become politically sacrosanct because the prosperous agricultural castes have taken to it to enhance their prospects in urban India.

**T**hough the Constitution left room for the so called backward castes to receive some form of preferential treatment, the wholesale adoption of the quota system is just a willful political extension of the reservation system as applied to the scheduled castes and tribes. Tamil Nadu was the first to initiate this change, which is why the Champakkam case was filed to protest against it in 1951. But by 1971, prosperous agrarian castes like the Vokkaligas of Karnataka demanded and received the benefits of a quota based reservation as they had Devraj Urs and Indira Gandhi to back them up. Initially the Lingayats were kept out of reckoning in keeping with the Hanavur Commission report. This was a political move as Devraj Urs wanted to isolate the Lingayats and win over the Vokkaligas. However, the Lingayats were eventually included once Ramakrishna Hegde came to power in Karnataka.<sup>11</sup>

The acceptance in 1990 by V.P. Singh of Mandal Commission recommendations only nationalized what was already happening in large parts of south India. These developments did not take place in isolation

but in active interaction. With the Yadavas, Kurmis and Koeris now becoming beneficiaries of backward caste reservations there is no question of holding back quotas, or even of revisiting them. The scheduled castes and tribes are therefore the indirect beneficiaries of the Mandal Commission and the Hanavur Commission and all that happened between these two events. Kaka Kalelkar's inability to designate backward castes on any firm set of criteria was forgotten as being too academic. The Rane Commission's espousal of economic criteria for backwardness had no takers. Quotas, instead, came to rule the day. As a result what we have is an equality of results more than an equality of opportunity.

**E**ven so, this is a big step for a country in which till recently even the shadow of an untouchable caste was polluting. We may not as yet fully appreciate the credo of the equality of individuals, but democracy in India has certainly brought about a developed understanding of equality between groups. This is why there is fierce, competitive rivalry between groups rather than between individuals. It is not as if the individual does not exist, but the tendency to refract the individual through a group rather than see it in its own light is indeed very strong.

Unfortunately, with the extension of the quota system and the entrenchment of the quota mentality, it will not be easy to make the transition from equality between communities to equality between individuals. This is where political statesmanship will be critical as it could help society either skip through, or make a rapid exit from the painful stages that come in between. A sociologist can only comment on the consequences of different political interventions, it is for the political system to ultimately make the difference.

# Comment

Act One: Sometime in the late 1960s. One winter evening a village boy, Chamar by caste, fell foul of his landlord for greeting him in a manner that he thought was the proper way of paying obeisance to an upper caste elder. The boy, who was in his early teens, folded his hands and mumbled *pranam* as soon as he came face to face with the landlord on a narrow *pagdandi* outside the village. The landlord, in his late thirties and with a huge paunch for his age, was furious. Shaking with anger he abused the lad and showered cane blows on him. The boy's father and grandfather were berated for his 'audacity'.

For a long time to come this minor incident was recounted by upper caste landlords as proof that school education for dalit and harijan youth was detrimental to society. They argued that the harijans would no longer remain dependent on the village economy once they received education. Their forefathers had been denied the right to education. That was why the upper castes had maintained their grip over the low castes. They held the Congress party responsible for encouraging harijans to do what had all along been denied to them. They apprehended that education would inculcate a sense of equality among the harijans and embolden them so as to question the authority of the upper caste landlords and ultimately demolish their age-old social and economic hegemony.

It was an act of unforgivable misdemeanor on the part of the boy – Anand Ram. His manner of greeting his landlord had scandalised and angered the Rajputs. He had not bowed and stooped low while greeting his landlord. Instead of saying *salam malik*, the boy had mumbled *pranam* which, as he should have known, is an exchange of greetings between persons of equal caste and stature. He had violated an old and established code of behaviour.

Act Two: March 1995. A group of Rajput youth from the village drove about 100 kilometers in a Maruti 800 car to a nearby town to attend a birthday function. It

\* The names of persons and places have been changed to protect their identity.

was the first birthday of the son of a Bihar Administrative Service officer who hailed from the same village as the young men. Perhaps, it was the first time a birthday function was held in a Chamar's family from that village. The officer, Vinay Ram, the first villager from the harijan caste to join the government, was none other than the younger brother of Anand Ram, who himself grew up to be a school teacher. The young men were from the family of the landlord who had more than 25 years ago felt humiliated because a harijan boy had dared to use a form of greeting traditionally reserved for the upper castes. Some of them tried to hide the fact from village elders that they were undertaking such a long journey to attend a function in a Chamar's family.

Some Rajput elders who knew of the young men's plan had their own explanation to offer. It was the eve of the Bihar Assembly elections. The then Chief Minister, Laloo Prasad Yadav, was seeking a second term in office. The village was tense and divided along caste and class lines, as always happens during the elections. Rajputs were also divided into two camps – one supporting Laloo Yadav's candidate belonging to the Janata Dal, while the others were for a notorious Rajput caste leader. Some of those who attended the birthday function were keen to enlist the support of Vinay Ram for the Janata Dal candidate. Vinay Ram was venerated among the village harijans as he was the first scheduled caste person to have risen to a high rank in the government.

Anand and Vinay Ram's father, Hari Ram, was the first Chamar to send his sons to school in the village. Jagdishpur is a nondescript, obscure village in the Sitamarhi district in north Bihar. The nearest railhead is more than 15 kilometers away. The distance of the village from the bus stop has shrunk from ten to five km in the last 30 years. In roughly the same period the profile of the village and its people has undergone a deep transformation.

Hari Ram, who was derisively called Haria (in Bihar the upper castes use suffixes such as 'a' or 'awa'

after names of low caste persons of either sex to remind them of their humble origins), was the only son of Dhangar Ram called Dhagarwa by everyone. Their determination to educate their growing children encouraged a couple of other Chamar boys to join the primary school.

Hari Ram had earlier violated another code of conduct by christening his sons Anand and Vinay – names with perfectly upper caste, Brahminical connotations. Where did the illiterate ‘Haria’ and ‘Dhangarwa’ stumble across these names? Had anyone ever heard of any Chamar with such names? This was the talk in the village once Anand and Vinay were enrolled in the school. Hari Ram was taunted for nourishing upper caste ambitions. Rajputs said that Haria wanted to inculcate upper caste *samskara* in his children.

While the Chamar elders continued to toil on the land owned and controlled by Rajput landlords, they sought to provide, to the best of their abilities, a protective and safe environment to their school-going children. They were shielded from the evil and exploitative eyes of the rapacious Rajput landlords.

The parents feared that the landlords might force them to withdraw their children from school, though they faintly understood that education was guaranteed as a fundamental right in the Indian Constitution. They were also conscious that their decision to school their children was an act of defiance against those who owned the homestead land of the harijans. Every once in a while, the Chamar school-going children were compelled to work or substitute for their parents in the fields. However, the two sons of Hari Ram, who showed early promise, were seldom sent to work. For that reason alone they were hated by the landlords. In their own community they were everyone’s favourites.

Jagdishpur is not a big village. Elders say the Rajputs settled in the village some 400 years ago. They originally hailed from Alwar in Rajasthan, though their first settlement in Bihar was in Chhapra district. They cursed their forefathers for having travelled to such a remote and backward village which continues to be ravaged by floods and remains unapproachable by road for well over half the year. If they had erred in selecting the topography and locale of the village, they were astute in having decided to provide a settlement to the harijans, mainly Chamars and Dusadhs, in the village. The harijans proved to be more docile than other low castes. Muslims were the other source of cheap labour in the village, but they were often more demanding and temperamental than the harijans.

There were roughly 50 harijan families in the village. They were settled in the northern part of the village in the neighbourhood of the Muslims. Nearly half of them were bonded to one Rajput family. Dhangar and Hari Ram’s family was the most prosperous among the Chamars even though they were yoked in bondage to Govind Singh. They owned a few decimals of land behind their house which stood on the land owned by Govind Singh’s family. Just the ownership of that minuscule piece of land conferred a special status on Hari Ram among the Chamars, though he was not inclined to accept community leadership in any form.

Hari Ram was shy, a man of few words. He seldom revealed his mind to anyone outside his community. The landlord accused him of being sly. He turned out to be more reserved and aloof after his two sons joined the village primary school. Anand and Vinay won government scholarships meant for the scheduled caste students which further encouraged the harijans to send their children to school. Hari Ram was subjected to public ridicule; he was taunted and sometimes abused for what he was doing for his children. ‘Solkans’ (harijans are called Solkans in some parts of north Bihar) should keep away from school and college education, the Rajputs said.

Hari Ram wished to escape from his employment as a bonded labourer, but he felt trapped. First, he could not feed his family without the daily wages that he earned by working on his master’s land. Second, any adventure at that stage in his life might have jeopardised the careers of his school-going children. In his youth he had tried to carve out an alternative career. He learnt to dance and sing in a village *nautanki* (dance troupe). For him it represented an escape from daily misery, 12-15 hours of hard work and repeated insults by the landlord. But the village troupe failed to sustain the family beyond a point and that was the end of it all.

Hari Ram was inspired to send his children to school by a local Congress party leader, Bhola Ram, who also happened to be a Chamar. He belonged to a village which was about five kilometers from Jagdishpur. He was the first and the only Harijan leader from the area covering several dozen villages who had attended school, though he failed to clear the matriculation examinations.

He had enrolled himself in the Congress after paying four annas or 25 paise. He frequently visited Govind Singh. Govind Singh’s elder brother was also a member of the Congress party. Rajputs often referred Bhola as Jagjivan Ram, the union minister who was a household name in Bihar. Bhola Ram too emphasised

his imaginary proximity to Babu Jagjivan Ram and often narrated anecdotes of his encounter with the great man in Patna and Delhi.

Babu Jagjivan Ram was a symbol of the aspirations and ambitions of harijans in Bihar, though it is doubtful he ever cared for them. The upper castes voted enthusiastically for him in the Sasaram Lok Sabha constituency. The Rajputs of Jagdishpur used his name as a simile to taunt any member of the scheduled castes who exhibited any form of ambition in life. Anand and Vinay Ram too were derisively called Jagjivan Ram by upper caste landlords.

Harijans of Jagdishpur invariably voted for the Congress party on the few occasions they were allowed to exercise their franchise. Later, they learnt to vote against the party that was supported by local landlords. Ironically, it was during the Emergency that they became vocal against the tyranny of the village landlords. Indira Gandhi and her son Sanjay Gandhi's tyrannical ways of dealing with the opposition and the people did not affect the thinking of the harijans. Hearing about Indira Gandhi's 20-point programme on All India Radio, with its emphasis on eradication of poverty and bonded labour, influenced Hari Ram and others.

The harijans and Muslims of Jagdishpur came into conflict with the Rajput landlords for the first time during the 1977 Lok Sabha election. They insisted on casting their vote for the Congress party in opposition to the upper caste landlords who supported the Janata Party. They were chased away from the polling stations by the landlords, creating an unbridgeable hiatus between them.

After the Emergency, for the first time, the harijans filed a criminal case against the upper caste landlords in the local police station. Once again, the person in question was Hari Ram. Govind Singh had abused and beaten up Hari Ram and his father, accusing them of stealing bullock cart tyres from the sugarcane field. Hari Ram had been entrusted to look after the sugarcane cart. Summons were issued to Govind Singh and his son who had to suffer the humiliation of standing in the witness box in the magistrate's court when seeking bail. There was quiet celebration in the harijan *basti* that night. They drew vicarious pleasure from the landlord's troubles and felt they had scored a great psychological victory over the landlords.

Education, elections and mass media like AIR were major catalysts in the social transformation of the harijans. Two harijan boys had become school teachers and the main breadwinners for their families. During elections, the dormant emotions surfaced and

conflicts came out into the open. This emboldened the harijans to assert themselves in other spheres of village life. Even the local *panchayat* elections polarised the village along caste and class lines. The poor landless harijans and Muslims, who never ever spoke up in front of the Rajput landlords, defied Rajput *diktats* and insisted on casting their votes. This was Indian democracy at work in full splendour.

However, the final nail in the coffin was struck when the Rajput landlords were dealt a severe economic blow in the early eighties. Jagdishpur is on the bank of the turbulent river Baghmata. As a flood control measure the government decided to tame the river by restricting its flow. Jagdishpur became a victim of the river's fury. A plan was worked out to shift and rehabilitate the village away from the river course. As part of the rehabilitation package, the harijans were allotted independent homestead land outside the village. For them it meant freedom from age-old bondage. In one stroke they had got what the zamindari abolition and land ceiling acts had failed to do since Independence. The landlords' coercive ways to extract cheap labour could work no more.

Hari Ram and others now travelled to neighbouring villages for work. They also began bargaining for daily wages. However, the local economy, the landholding pattern and the absence of any movement for increase in daily wages forced them to work at more or less the same rate. The advantage was that they were no longer in bondage. They could choose their employers at their free will.

In due course, the landlords of Jagdishpur faced an acute shortage of agricultural labour. They were compelled to hire labour from other villages who demanded higher wages. The relocation of village and annual floods had crippled the village economy. The annual yield of paddy dropped to a quarter. The worst sufferer of the change was Govind Singh (who has since died) and his family.

His sons, who were unused to waking up before sunrise till well after Hari Ram and other labourers had gone to the fields, now had to make the rounds of the harijans' *tola* (locality) much before dawn. They were forced to go to every house imploring the harijans to come and harvest the drying paddy. The labourers often ignored them, pretending to be asleep.

The harijans of Jagdishpur are now the masters of their own fate, even though there has been little change in their economic condition.

**COMMUNALISM CONTESTED: Religion, Modernity, and Secularization** by Achin Vanaik.  
Vistaar Publications, New Delhi, 1997.

**SECULARISM AND ITS CRITICS** edited by  
Rajeev Bhargava. Oxford University Press, New  
Delhi, 1998.

**COMMUNALISM IN INDIAN POLITICS** by  
Rajni Kothari. Rainbow Publishers, Delhi, 1998.

**IN THE NAME OF THE SECULAR: Contemporary Cultural Activism in India** by Rustom  
Bharucha. Oxford University Press, New Delhi,  
1997.

ABOUT communalism and secularism there are no certainties any more, at least in some quarters. The influence of Hindutva has raised doubts about their hitherto accepted meanings, both in popular and academic understanding. The consequent debate and introspection, though often partisan and passionate, has helped foreground the need to be sensitive to the complexities of their social and political articulations. Towards that end, these books make a significant contribution.

Much of the writing on secularism in India tends to be confined to the problematic of the relationship between the state and religion. The collection of essays put together by Rajeev Bhargava largely traverse this familiar terrain. Achin Vanaik, on the other hand, shifts the focus to secularisation of civil society, though without overlooking the question of the secularity of the state. How the weaknesses of our democratic polity enabled the consolidation of communalism is the main concern of Rajni Kothari, whereas Rustom Bharucha explores the inadequacies and frailties of secular cultural practices. Collectively these four books underline a large number of issues currently being debated among secular scholars and activists.

This many-splendoured debate, ranging from an uncritical defence to unqualified rejection of secularism, forms the core of Rajeev Bhargava's collection

of essays, which according to the author is born out of the felt critical need to work out 'an alternative conception of secularism' and 'not to seek an alternative.' Firmly anchoring himself in the secular camp, Bhargava sets out to give secularism its due. He does that by bringing together both the critique and defence and then demarcating his own position from both.

The critics of Indian secularism, outside the communal rabble, fall into three distinct categories. The first group takes a Eurocentric view wherein secularism is seen essentially as a Christian idea and hence alien to the religious cultures of India. It argues that 'Indian culture encompasses the secular with the religious' and the latter is too much a public matter to be restricted to the private. Therefore, secularism is inappropriate for the Indian situation and its adoption by the Indian state is an unwarranted and artificial imposition.

The second group views secularism as a child of modernity, designed by it to meet the challenge of religion-as-ideology to modern statecraft. What secularism does, they believe, is 'to sanction the imposition of an imported language of politics on a traditional society.' They argue that 'it is from non-modern India, from the traditions and principles of religious tolerance encoded in the everyday life associated with the different faiths of India, that one will have to seek clues to the renewal of Indian political structure.'

The third group questions the appropriateness of secularism to counter the political challenge of Hindu majoritarianism. They hold that the 'Indian state has never been and is hardly ever likely to be secular.' The protection of minorities can be ensured, not by secularism but only through religious toleration, which should be given 'a proper institutional form by allowing religious groups their own parliament, i.e., a deliberative body to decide on matters of the entire community to which members are elected.'

These three positions are represented in the volume by the essays of T.N. Madan, Ashis Nandy and Partha Chatterji respectively. Speculative in character and not grounded in empirical reality, they are essentially theoretical constructs, the veracity of which

is quite open to doubt. Moreover, most of their arguments bear a close resemblance to the communal discourse and as such lend legitimacy to communalism, even if some of them distinguish themselves as 'anti-secular secularists.'

Akeel Bilgrami, though critical of the above trio, does not represent the other view which largely draws upon the Nehruvian model of secularism. Bilgrami is of the opinion that Nehruvian secularism was indeed an imposition, but not brought about by a modern intrusion into an essentially traditionalist religious population. Instead, it is an imposition because it is not one among substantive contested political commitments. He contends that secularism can 'emerge as a value by negotiation between the substantive commitments of particular religious communities.' Like some anti-secularists, Bilgrami also takes a communitarian view which is likely to lend legitimacy to undemocratic political practices based on majoritarianism and minoritarianism.

Nehruvian secularism and its refined variants are not adequately represented in the Bhargava volume. The only exception is the essay by Amartya Sen which seeks to contend with the misconceptions and scepticism in the popular mind. Rajeev Bhargava's own effort, in his words, is to 'work out an alternative to it.' Such an alternative conception he posits in what he calls 'contextual secularism', which ensures 'a dignified life for all, prevent discrimination on grounds of religion, check religious bigotry and manage frenzied internecine conflicts that plunge societies into barbarism and into an escalating spiral of violence and cruelty.' This is likely to be unexceptionable, both for the Nehruvians and anti-secularists. The problem could possibly be the prescription that follows: 'The intermingling of religion and politics is permissible as long as it helps meet these objectives but if any of blending defeats these aims, then their amalgamation must be restricted.' Whether such a perspective is likely 'to save secularism from its critics' or give 'what is due to it' appears to be unlikely.

A more careful editing, both by deletion and incorporation, would have helped to enhance the quality of this rather bulky volume. The first two sections on the 'Secular Imperative' and 'Secularism in the West' could do with some pruning. Written by western scholars, they preface the Indian debate with the European experience; the course of enquiry for an alternative concept thus seems to be pre-set. The failure to interrogate the Indian historical experience leaves out some of the seminal writings on the subject. The selection of essays creates an impression that the

editor, like some of the contributors, is trapped in the European paradigm.

The analytical framework of Achin Vanaik's excellent and incisive book is a welcome departure. He shifts the focus away from the European experience to the process of secularisation in Indian civil society, though unlike in the West the details of this process have not been fully worked out by historians in India. Yet, the broad contours of this process, socially and intellectually, are not altogether unfamiliar. The centrality attributed to this process in Achin Vanaik's work guides the debate to new pastures, thus opening up the terrain for theoretical and empirical investigation.

Communalism in India is not intelligible without a reference to the role of religion and the consciousness it entails which, in modern times, has become increasingly complex and dynamic. Understandably there are sharp differences of opinion about how to locate religion in the secular-democratic process in India. Ashis Nandy posits a distinction between religion-as-faith and religion-as-ideology: the former 'a way of life, a tradition which is definitionally non-monolithic and operationally plural'; the latter a 'sub-national, national or a cross-national identifier of populations contesting for or protecting non-religious, usually political or socio-economic, interests.' There are at least some takers for this fundamentally flawed idea, if Rustom Bharucha's invocation in his analysis is any indicator. In dichotomising faith and ideology, Nandy seems to miss their inevitable relationship between what makes religion-as-ideology into religion-as-faith. Achin is absolutely right in his assessment that 'the analytical separation of faith and ideology must never be misrepresented as an actual dichotomy.'

Vanaik is equally critical of both classical Marxist and liberal attitudes towards religion. He rejects the premise of Marx and Engels that by the 19th century religion had exhausted its potential as a progressive force in society. Liberation theology, he contends, is proof enough to the contrary and also demonstrates that secularisation takes place not only against but also within it. Be that as it may, secularisation within religion is a limited liberation; it tends to circumscribe social consciousness within religious parameters and is likely to retard rather than promote the secularisation of civil society. An 'atheistic utopia' may be unrealisable; so is Vanaik's hope that religious systems would learn to become compatible with a more secular, democratic and humane modernity. What Rammohun Roy said almost 200 years ago is worth recalling: 'All religious systems are systems of deception.'

What distinguishes the perspective of Marx and Engels is the relationship it posits between religion and power. It is not to deny the progressive role of religions in certain historical conjunctures; their writings on Germany and France allude to several such instances. Yet, that religion is an ally of the oppressive classes is equally born out by historical experience. If so, a struggle – an element of confrontation if you like – is inevitably embedded in the pursuit of a secular democratic revolution. The nexus between social and religious practices in India makes this all the more important.

Vanaik has advocated elsewhere (*The Hindu*, 16 November 1997, in a review of my book, *Communal Threat, Secular Challenge*, Earthworm Books, Chennai) a multi-dimensional approach – economic, political, social and cultural-ideological – which would ‘situate the secularism/secularisation problematic within its more encompassing framework of democratisation.’ What will enable the deepening of the processes of democratisation and secularisation is a complex question. But, if secularisation is ‘understood as relative decline in religious influence’, an element of confrontation with the powerful presence of religion in public sphere is unavoidable. The manner in which that could be promoted by democratic secular forces without perpetrating violence to the existing state of consciousness is a matter that deserves serious debate. Such a debate cannot be conducted on the terrain of theory alone, but has necessarily to be sensitive to the social and political processes that led to the communalisation of Indian society, particularly during the last two decades. What imparted social acceptance to the process of communalisation was, among others, its perceived relationship with religious identity.

Rajni Kothari’s essays underscore the political praxis that made it possible for communalism to thrive. His contention is that communalism gained strength ‘mainly because of the vacuum created by the erosion of democratic institutions, especially of the party system dominated by the Congress, with no secular alternative in sight, and the failure of the state to move forward with the development process.’ The Emergency was a watershed in Indian politics; it signified ‘a breakdown in the political process’ from which the Indian polity has not yet managed to fully recover. That fundamentalism and communalism were able to enlarge the political space at their command was perhaps the most disastrous consequence of the Emergency.

Given that culture is an important domain through which communal forces have tried to expand their influence, a critical appraisal of secular cultural

activism is long overdue. Rustom Bharucha’s essays, written with a sensitivity and passion generally missing in academic discourse, is an attempt in that direction. Emphasising, like Achin Vanaik, the secularisation of civil society, Bharucha advocates a reorientation of the secular dialogue from the present ‘confines of seminars, conferences and journals on to a wider spectrum, where the language of secularism can be grounded in the struggles of everyday life.’

How this can be done is suggested through a critique of IPTA (Indian Peoples Theatre Association) and Sahmat (Safdar Hashmi Memorial Trust) on the one hand and Mani Ratnam’s *Roja* and Anand Patwardhan’s *Father, Son and Holy War* on the other. Unhappy with the present cultural activism in India, he finds an ideal in the Third Sector movement in Brazil which is based on ‘a coalition of social and political groups, broadly structured through a popular movement, with a wide spectrum of ideologies converging around social democracy.’ What prevents the formation of such a coalition in India, according to him, ‘is the sectarianism within diverse social and political activist groups who are unable to meet through differences.’ This judgement is not fully borne out by his criticism of Sahmat which has, over the last 10 years, tried to bring together on the same platform artists with different perspectives.

The progressive-secular cultural activism can certainly do with some critical assessment and introspection, for that alone can further its creative frontier. Bharucha’s finely crafted essays are a useful step in that direction, even if his critique of Sahmat and IPTA essentially covers known territory and often reinvokes issues which were debated within these movements. Thus, he goes through the familiar ground of IPTA’s faltering interrogation of tradition, unimaginative appropriation of the folk, and the failure to resolve the tension between the political and the cultural. Yet, he rightly acknowledges IPTA as ‘an indispensable point of reference for almost any discussion on cultural politics in India.’ This is because the progressive cultural movement, of which IPTA is a part, brought about a significant break in the cultural consciousness in India.

Sahmat’s attempts to reclaim the communalised space through creative and innovative interventions has several critics, both within the left and outside. Among its many initiatives, the exhibition on Ayodhya, *Hum Sab Ayodhya*, and the cultural evening *Muktanaad* at Ram Ki Pauri at Ayodhya have received most critical acclaim and disapproval. The exhibition was appreciated for its secular interpretation of the

history and culture of Ayodhya whereas Muktnaad was seen as a bold and daring attempt to break the communal siege at Ayodhya.

While recognising the importance of these activities as well as Sahmat's other initiatives at Mangolpuri and Mumbai to sensitise the exploited and the marginalised to our secular ethos, Bharucha advances three major criticisms: the dependence on the state for funding, dichotomisation of the traditional and the contemporary, and the inability or unwillingness to incorporate the local people through a dialogue with them.

For organising Muktnaad at Ayodhya, Sahmat received funds from the state, 'not without usual bureaucracy' as Bharucha states, 'but through the normal channels and procedures prescribed by the state.' By equating the state with the government, it is alleged that the money was gifted by the Congress and that too by its factional leader, Arjun Singh, heading the ministry of culture. If it is not appropriate to identify the state with the government and the party which runs it, it is only legitimate for public organisations to claim earmarked money from the exchequer.

Such claims need not lead to 'unquestioned statist loyalties', particularly when the money is used for socially and politically progressive purposes. In a democracy 'the principled distance' from the state needs to be negotiated through the extent of freedom demanded and obtained. That the radical intelligentsia in India is able to function in institutions funded by the state is because of the autonomous space available within them, which is required to be constantly defended and struggled for in order to guard against what Gramsci calls 'transformism'. In criticising Sahmat on this score, Bharucha like some others appears to be influenced by an element of 'romantic radicalism' which fails to take cognisance of the democratic possibilities within a bourgeois state.

The criticism of Sahmat for interacting with the Delhi police in a bid to sensitise this communally-prone force is equally misplaced. It is indeed true that Delhi policemen were 'notoriously involved in the engineering of pogroms, notably against the Sikhs in the aftermath of Indira Gandhi's assassination.' At the same time there are instances of policemen taking initiatives to form *mohalla* committees as in Bhiwandi and Mumbai for preventing communal riots, which the author quotes with approval. Within the police, therefore, both possibilities exist: to be on the side of the communal and also to act against it. While the former is to be opposed and condemned, the latter deserves to be supported and promoted.

However, Bharucha is critical of Sahmat for helping the police in their anti-communal campaign, for he believes that what Sahmat did was to help organise readings 'for the gratification of a supposedly cultured police force.' In fact, it was an evening of *mushaira* at communally sensitive Chandni Chowk, in which some of the outstanding poets known for their anti establishment and secular views brought to the audience, mostly locals, the pathos of communal hatred. If reclaiming the communalised space is a necessary task, it would be unwise to leave out the men who man the state institutions, be they in the police, bureaucracy or army. And if any of them is prepared to serve the cause, as the Delhi police did by observing an anti-communal week, it would have been counter-productive to isolate them for the past mistakes of some of their colleagues.

Held in the wake of the demolition of the Babri Masjid and in the teeth of opposition from communal organisations like the Bajrang Dal and the Vishwa Hindu Parishad, it is but natural that Muktnaad was noticed for its political import. In the process, its significance as a secular cultural event is generally overlooked. It brought together on the Sahmat platform practitioners of diverse forms of art for whom, whatever the idiom and language, art is essentially humane and secular. Thus Kelucharan Mahapatra, Sitara Devi and Rajan and Sajan Misra delved into the tradition to foreground the universal.

Bharucha has rightly sensed that Sitara Devi rendering Ram Dhun in a location where a mosque was destroyed has secular significance. Hence it also has a contemporary resonance. If so, the distinction between the traditional and the contemporary loses much of its edge. At any rate Muktnaad neither dichotomised nor prioritised the traditional and the contemporary, as the author believes, for the very format of Muktnaad did not admit of any such division. The rather unstructured way in which the programme evolved through the night broadly underlined the contemporary ambience and nuances traditional art forms gained through contextualisation.

Sahmat's alleged elitist character has by now become a widespread belief. At the time of the Hum Sab Ayodhya exhibition even a left politician commented on its high-flying image. In the reckoning of some, the emphasis on classical forms appears to be one of the reasons. Bharucha advances another explanation – a lack of dialogue with the local people. I wonder whether he was present in Ayodhya at the time. If he were, he would have experienced the silent support

Sahmat received from local people, at great risk to their safety. For they knew that Muktnaad had made it possible for the minorities to recover their self-esteem and live with greater dignity, even after Sahmat members 'returned to their homes in New Delhi.' At any rate, there is enough about Sahmat in the essays – Mangolpuri camp and Mumbai and Bangalore events – to suggest how the organisation reached out 'to those who may have no access to the political discourse of secularism.'

Neither constructing secularism nor contesting communalism can be successful without an engagement with both the state and civil society. The Indian state, although secular in principle, has often vacillated in its commitment and succumbed to the communal imperatives. Therefore, retrieving the secular space within the state is as important as furthering secular consciousness in civil society. The relationship between the secularity of the state and the secularisation of civil society, however, is dialectical and inter-dependent. Secular action, both cultural and political, therefore calls for a dual strategy: a simultaneous struggle for expanding the secular space within both the state and civil society. Rethinking secularism and communalism has become essential in the contemporary context. Foregrounding this need itself is the beginning of a healthy debate, the necessary contours of which these books attempt to delineate.

**CHALLENGING UNTOUCHABILITY: Dalit Initiative and Experience from Karnataka** edited by Simon R. Charsley and G.K. Karanth. Sage, New Delhi, 1998.

THE category of dalit has lately acquired a certain salience in Indian politics, overturning in terms of mobilisational appeal the precursor labels of untouchable and harijan. These discontinuities in terminology mirror different moments in the evolution of community identity. Depressed classes, which was the term of reference in a more general era, could not survive the scathing riposte that all sections of the Indian population were 'depressed' on account of colonial subjugation. 'Untouchable' was coined as a brutal description of a brutal reality, and later came to be assimilated by the victim populations as an ironic comment on the irrationality of the social structure they lived within.

The epic clash between Gandhi and Ambedkar created the conditions for an integration of these sec-

tions into the structures of governance through the new category of 'scheduled castes'. This remains a category that is purely administrative in its purposes and connotations. In terms of inclusion of diverse social groups, it has remained frozen in time for much longer than the underlying political realities seem to warrant. But efforts to recategorise are invariably met with a storm of protests. The SC category has, like much else, become part of the embedded equilibrium between political pressure groups.

Briefly, these aspects of the overarching political reality set the context for Charsley and Karanth to organise this set of essays. Authored by social scientists working in Karnataka, these essays delve deep into various aspects of social organisation in seven distinct villages of Karnataka. The participants' observation method chosen is consistent with the authors' conviction that deeper understanding requires an unraveling of the layers of articulation of dalit politics, starting from their local forms of expression in the endogamous caste grouping or *jati*.

Identities in nomenclature, the authors find, need not necessarily point to identities in social and political interests. Sections of the dalit population have assimilated cultural resources in diverse ways in their struggle against inherited disabilities. Some have renounced traditional *jati* nomenclature in favour of an appellation that proclaims a primeval claim to habitation of the land – such as *Adi Karanataka* or *Adi Dravida*. Others have taken on the culturally neutral but politically assertive dalit label, and still others the scheduled caste label of bureaucratic impersonality and administrative neutrality. While these emphasise in various ways an element of dissent and separation from the wider cultural milieu, there are dalit sections which have chosen the path of integration, typically through retaining their *jati* appellations while rationalising their social status through some myth of origin.

In this volume Charsley and Karanth seek to portray the diversity of the forms of combat that the victims of unequal societies adopt to rid themselves of inherited disabilities. Avenues of economic advancement are limited and precarious in terms of their rewards, though perhaps abundant in terms of risks. Electoral politics has tended in places to produce a new understanding of convenience between the untouchable sections and traditionally dominant groups. And quite in contrast to the picture of unrelenting oppression that the dalit movement in national politics has often sought recourse to, local realities often provide rich instances of ritual participation and assimilation.

The cultural resources deployed by the dalit movement are different. Though primeval claims and the effort to restore a sense of continuity with historical deprivation (whether real or constructed) are important, the emphasis of the largely urban-based dalit movement is on modernisation and the application of technological resources in political struggle. Though the dalit movement does strike up powerful resonances in the countryside, some of its modes of expression have perhaps been less than successful in bridging the urban-rural gap.

The dialectic of local and national factors is one of the main concerns of this set of essays. The seven specific field studies provide the basis for a number of generalisations about how national politics has impinged on the struggle against caste debilities, how certain rigidities of perception and policy have reduced a situation of local complexity to one of artificial homogeneity.

Charsley and Karanth have grappled with a complex reality without seeking excessive recourse to any simplificatory device. This book is the outcome of a collaborative venture between two institutions, the Department of Sociology in the University of Glasgow and the Institute for Social and Economic Change, Bangalore. It is a book that reflects, virtually on every page, the looming presence of the doyen of Indian sociological research, M. N. Srinivas. It is essential reading for an appreciation of current social realities, especially for those who believe that politics in the next few years will be dominated by the re-entry into historical processes of traditionally disadvantaged and oppressed groups.

**Sukumar Muralidharan**

**DALITS IN INDIA: Religion as a Source of Bondage or Liberation with Special Reference to Christians** by James Massey. Manohar, New Delhi, 1995.

**DALITS AND CHRISTIANITY: Subaltern Religions and Liberation Theology in India** by Sathianathan Clark. Oxford University Press, New Delhi, 1998.

FOR long it had been conventional and to an extent tautological to link Christianity with dalit liberation. However, in recent years there has been much caste-based tension among the Christians. In fact, the multiple contradictions and submerged conflicts among the dalit

Christians are now spilling over in a *manthan*. This leads to several questions such as: Has Christianity actually been a liberative force and has it fulfilled the dalit aspiration for a new identity in society? If not, then how do we understand and respond to the growing challenge? These questions articulate the need for a clear understanding of the dalit Christian experience along with a more constructive and inclusive response. The two books under review makes significant contributions in this direction.

James Massey, through his historical analysis, points out that dalit Christian experience, in its surge for justice, has been one of continuing let downs and reactions. Today the dalit Christians are experiencing multiple discrimination. So deeply rooted are the caste prejudices in Indian society that the Church, despite its proclaimed break with Hinduism and the caste system, is not devoid of caste discrimination. Within the Church set up caste identity overrides religious identities.

While the 'untouchables' approached the missionaries in the hope of finding equality and a new identity, they continued to be treated as untouchables because earlier converts had already occupied all the positions in the caste hierarchy, leaving none vacant for the neo-Christian. As a result, the Church even failed to provide the dalits full advantage of its educational facilities. The opportunities made available by them disproportionately benefited upper caste converts while the dalits got further marginalised.

At the community level the dalits continue to be treated as inferior because of their birth. For example, in predominately Christian villages, the dalit colony is distinct and separate from the upper caste settlement. The economic conditions are also deplorable. Data on educational mobility and occupational advancement of Protestants in Madras reveal that the dalits lag far behind. In Andhra Pradesh, Kerala and Karnataka the dalit economic position, despite their conversion, has not improved. In Kerala the dalit Christians are mainly landless labourers. There is no question of inter-dining or inter-marriage between the dalits and the Syrian Christians.

While, the state that declares itself secular, does not extend the schedule caste privileges to them on a purely religious basis, i.e., because they are Christians, similarly, no political party has taken up the reservation issue seriously. The Hindutva forces, instead of addressing the problems of the dalits, are propagating the idea of re-conversion, as if that would in any way improve the position of the dalits. The other political

parties too calculate the political advantage or disadvantage in extending reservation to dalit Christians. Massey concludes the book by pointing out that the state should extend reservation to the dalit Christians too. After all a dalit is a dalit irrespective of his/her religion.

While one agrees with James Massey's understanding of the Indian state and its responsibility, the question remains whether the extension of reservation would be enough to face the challenge of dalit identity. Undoubtedly, the emerging politics of 'fragmentation and dissension' that one is witnessing among the dalit Christians is but a reflection and consequence of the unreconciled social differences and deep cultural divides still endemic to our society. But even more, it is a search for a new identity. Moreover, does economic aggrandizement necessarily mean social and cultural empowerment too? In other words, one needs to go beyond the politics of reservation into the realm of the existing power structure.

Moreover, whether religion is change-promoting or change-inhibiting, its effectivity in social action is largely determined by its social location, its relation to other institutions in society and its internal structure. In this context, James Massey needs to relate the content of religion more closely to the context.

It is here that Sathianathan Clarke's book becomes important. To tackle and confront the issue of dalit identity, two different approaches can be adopted. One is to function within the existing parameters of the power structure and to mould them in favour of the oppressed. Another is to question the parameters themselves, seek out their roots, subject them to scrutiny and discard them in favour of others favouring the oppressed. Sathianathan Clark seems to have opted for the first approach.

Clark makes an analysis of Christian theology as the source of power and patronage to the dalits. Indian theology, contrary to its proclaimed aim of being inclusive, has been exclusionary and hegemonic in nature. It has been at once fragmented and monolithic, riven by multiple divisions yet providing no real pluralism, with no vibrant democratic process in its organizational framework. In sharp contrast to the monolithic set up of the Church there are multiple human experience competing with each other. However, by treating human experience as an ever-present universal intrinsic to every kind of human activity, the church has devalued the multiple human experience of different collectives.

By the valorisation of particular collectives of human beings it has only created a homogenised culture. In this entire exercise the experience of dalit religion has got marginalised and subordinated. As a result, theology in place of being a critical construction has become elitist – reinforcing the construals of the dominant discourse – producing a discourse of the caste converts.

In theory, Christian tradition is local, plural, dynamic and there is really no common or unitary manner in which it operates in the life of the community. Consequently, there is significant difference in the manner the caste and dalit Christian traditions have evolved. While the educated and literate caste Christians may evolve traditions based on the written scriptures, the uneducated and illiterate dalit Christians have been handed down traditions based more on oral versions of scriptural stories. Which are local, plural and dynamic.

Though dalits account for a major proportion of Christians in India, Indian theology has largely ignored the factuality and fecundity of their socio-historical reality. The caste converts constructed their theology by taking into account their particular heritage, i.e., caste Hindu tradition, and largely ignored that of the dalit converts. As a process it has become hegemonic in character.

To capture the dialogical, inclusive and liberative dimensions of theology there is an urgent need to identify the nature and function of oral scriptures in the life of the dalit Christians and the ways in which it is both dependent on and free from the written scripture. The religious world of the dalits must be recollected and remembered. This would not only make Indian theology more liberative but also help it in countering the sanskritizing tendencies inherent in it.

In this context, the recollection and reconstruction of the history and cultural traditions of the Paraiyar community of Tamil Nadu could help in understanding the resistive and dynamic nature of the dalits. First, the Paraiyar claim to be the original inhabitants of the land. Second, they are a culturally distinct community with the drum as a key symbol of this particularity. And third, they are an economically oppressed and religiously and culturally marginalised community, mainly because their distinctive heritage is not in conformity with the traditions of the caste Hindu community.

The Paraiyar religion is explicated through a creative interpretation of goddess Ellaiyamma and the drum. Ellaiyamman symbolizes the distinctiveness

and particularity of the Paraiyar religion in its resistance against the invading the co-opting tendencies of caste Hindus. Moreover, the drum provides an important key to understanding the particularity of the religion of the Paraiyar.

A close analysis of their religious traditions brings to the fore that subaltern religions are not mere 'false consciousness' that are manufactured by the vested interest of the dominant classes. On the contrary they are the locus for the reconfiguration of subaltern subjectivity. Based on the indepth analysis of the history and traditions of the Paraiyar's, Clark creates a provisional dalit Christology with the hope that it would make Christian theology truly liberative.

Undoubtedly, Clark has been able to touch the nerve centre of the problems associated with dalit Christians. But the question is who bells the cat? How will the process begin and what would be the role of dalits in initiating this process of change, specially in the given context of unequal power relations? These are some of the questions which needs to be answered in order to translate theory into practice.

Arundhuti Roy Choudhury

**QUEST FOR POWER: Oppositional Movements and Post-Congress Politics in Uttar Pradesh** by Zoya Hasan. Oxford University Press, Delhi, 1998.

IN no other state has the decline of the Congress party been so dramatic as in Uttar Pradesh. Even though this was evident since 1967 when the *Jat* (peasant) leader Charan Singh parted ways from the Congress to float his own outfit, the Bharatiya Kranti Dal (BKD), the past decade has finally drawn the curtain on Congress dominance.

Ironically, U.P., which was the heartland not only of cultural nationalism but also of the Congress party, proved to be the watershed for Congress politics. This was not entirely surprising since the state has been a progenitor of most changes that have subsequently overtaken Indian politics in the post-independence period. The peasantisation, the dalitisation and backwardisation, and now Hindutva – all originated and flourished largely in Uttar Pradesh.

The book under review draws our attention to the rise of the movements which eventually occupied the space created by the decline of the Congress party in the state. The author of the book, Zoya Hasan, has termed these developments as oppositional movements which became increasingly relevant and in fact

accounted for post-Congress politics in U.P. The net consequence was the 'exit of the centrist agenda from the political imagination and the invention of exclusivist mobilisation and sectional social coalitions as vehicles for capturing political power' (p. 60). This culminated in class, caste and communal polarisations.

The first major political development was an assertion by the surplus producing farmers, particularly in the western districts of the state. The land reform legislation which followed the Zamindari Abolition Act never really succeeded. Consequently, few landlords in U.P. lost any significant amount of land. 'Basically, land reforms were effective in eliminating the old system of tax farming and in creating a new hierarchy of peasant proprietors in place of landlords and tenants' (p. 74). It was this class of medium and large landholding farmers who eventually made use of the Green Revolution package and emerged powerful enough to challenge the dominance of the Congress party. The disenchantment of this class from Congress politics was largely responsible for the weakening of the Congress hold on state politics.

The rise of peasant power in U.P. was largely confined to the western districts in view of the land distribution pattern there. Since the Jats who constituted the bulk of these farmers were technically outside the fold of the 'backward classes' (even though they were not the twice-born), their struggle against the Congress politics could not capitalise on the political momentum generated by the backward caste politics in east U.P. The socialists always had an important stake in the mobilisations in these areas. When the backward castes emerged as a major challenge to the Congress politics in some of the north Indian states in the post-Mandal era, the Jat farmers of west U.P. could not but join the anti-Mandal agitation.

It was left to the BJP's Hindutva politics to 'unite' the peasant and backward caste assertions against the Congress by attempting the 'homogenisation' of the entire 'Hindu community', seemingly bypassing the caste and class divisions in Hindu society. The success of the Hindutva project lay in 'cementing' the electorate to enable the BJP to cut into the support bases of the 'encroachers' in the space created by the withdrawal of the Congress umbrella.

Ironically, BJP politics has been most successful in a state which was not traditionally the party bastion, and unlike Madhya Pradesh, Himachal Pradesh or Rajasthan where for decades the BJP was placed second after the Congress, it was not the main opposition party in U.P. This position was held by the BKD or later

by the Lok Dal and the Bharatiya Lok Dal. As late as 1984, the BJP had no representation from the state in the Lok Sabha; it had only eight MPs in 1989. The rise of the BJP is therefore dramatic only after 1991 when U.P. became a major contributor to the party's tally in the Lok Sabha. It was precisely for this reason that Hindutva politics became crucial for the BJP in a state like U.P. where in the absence of a party network (*a la* Rajasthan or Madhya Pradesh), it would have taken decades to build a party organisation from the grass-root. Hindutva politics helped in short-circuiting this otherwise long drawn process, for which the BJP was obviously not prepared to wait.

While Zoya Hasan has done well by way of drawing on the various developments in post-independence politics and analysing the various possible interconnections, the book somehow lacks the rigour of a researcher who dwells on primary data. It seems that she has largely relied on newspaper reports and comments for her crucial conclusions. While newspapers and news magazines can be a source of primary information, any reliance on them for views (in contrast to hard news) and analytical comments is not entirely free of intellectual risks. Most newspapers have their own agenda and are well-known for their politico-academic biases.

Excessive reliance on the 'English press' is particularly hazardous in understanding the politics of a state where, in the author's own analysis, a 'Hindi only' policy has been adopted for years, and the English press more marginalised than in any other state of India. Interestingly, the two most powerful (in terms of sheer reach and circulation) chains of Hindi newspapers, *Amar Ujala* and *Dainik Jagran*, have been referred to only to censure them as being part of a communal campaign against the Muslims during the course of Ayodhya mobilisation episode. While the bias of these newspapers was well known, they were far more balanced after the Babri Masjid demolition and refrained from indulging in the frenzy that they had provoked during the *kar sewa* episode in 1990. The author could have referred to them at least on the issues of casteisation and peasantisation of politics.

The metropolitan academia seems to have so completely internalised the anti-Hindi and anti-small town bias that it relies excessively on what is available in the English magazines and press, as if the latter is free of any bias. Consequently, 'U.P. bashing' is indulged in out of sheer internalisation of this bias. Thus, while regional languages were being promoted (rightly or wrongly) in many north Indian states, the

policy of the Congress to push Hindi in U.P. came to be viewed as something which produced half-literates termed 'Hindi-literati'. The author approvingly quotes a study that maintains: 'The social and intellectual world of the Hindi speaking intellectual continues to be very narrow and their general culture is quite parochial' (p. 187).

The author's identification of Urdu with the idiom of pluralism and that of Hindi with somewhat narrow nationalism is not quite balanced. Similarly her assertion that 'the Hindi-Urdu differentiation made Hindi a potent instrument for the politics of religious and cultural separatism' (p. 189, emphasis added) ignores the ground reality that this was not entirely due to the 'Hindi only' policy of the U.P. Congress but had as much to do with the anti-English attitude of the rising OBC and even upper caste elite which was keen to dislodge the urban English elite from positions of power. She does grudgingly concede this point (p. 178) but somehow equates this with an anti-Muslim bias. Any replacement of English by Hindi at the level of higher education would have necessarily meant distancing of the language from the spoken Hindustani which had characterised the common heritage of the state. Even today the *lingua franca* (as against the official or written language) continues to be a mix of Hindi-Urdu, call it Hindustani, Hindi, Urdu or by any other name.

Unfortunately, for various reasons a beautiful language like Urdu came to be associated with Muslim communalism, but it was not as if only the Hindi enthusiasts were harping on a Sanskritisation of their language. It may be noted that even in a prosperous (and therefore 'progressive') state like Punjab, where the Congress was never dominated by upper caste Hindus, the regional language (Punjabi) was promoted with a vengeance, and that too after it had been completely dePersianised and Sanskritised.

While the reviewer has his own perspective on U.P. politics and does not intend to impose it on the author, it is crucial not to be swayed by grand ideologies which more often than not block the vision of a researcher. Though Mulayam Singh Yadav did check the growth of Hindutva politics in U.P., would it be intellectually fair to equate his efforts with secularism and pluralism, as the author, like some left intellectuals, seems to have done?

The book is over-descriptive in detailing the rather well known developments like the rise of the OBCs, the peasants and the Hindutva politics in U.P. and follows a perspective generally held by the metropolitan elite.

The author is right in maintaining that U.P. suffers from a lack of regional identity which has denied it the benefit of a regional elite who could represent the state. This is perhaps even more true of intellectuals who can sympathetically analyse the state's politics without dismissing every development as an outcome of a retrogressive small town mentality of a parochial Hindi elite.

Surprisingly, even an OUP publication is not quite free of printing errors. Mainpuri is printed as 'Manipuri' (p. 40); the OBC combine is reported to have increased its 'vote share' from 42 to 176 (p. 160); the demands of Urdu supporters 'recieved' some attention from the Central government (p. 184); and the Congress was not inclined to stem the rot which had 'set in the from the 1970s' (p. 192); and finally, a sentence in a footnote (p. 117) reads '...*anyone* who owned land preferred to get *their* crops cultivated through share croppers rather than cultivate *themselves*.' (emphasis mine).

Nevertheless, the book is useful for those keen to acquaint themselves with the major developments in post-independence U.P. politics. The book adequately deals with not merely post-Congress politics (as the title indicates), but even the period of Congress dominance.

**Pradeep Kumar**

**THE FLAMING FEET: A Study of the Dalit Movement** by D.R. Nagaraj. South Forum Press, Bangalore, 1993.\*

WITH Kanshi Ram's Bahujan Samaj Party's somewhat spectacular performance in the recently concluded Assembly elections, attention has once again focused on the status and movements of dalits in the country. Be it Professor M.S. Gore's *The Social Context of an Ideology*; Gail Omvedt's *Dr. Ambedkar and the Dalit Movement in Colonial India*; or even Koenraad Elst's tract for the Hindutva brigade, *Indigenous Indians: Agastya to Ambedkar*—the last year has seen at least a dozen offerings seeking to explore the implications of the graded inequality built into our caste system—existentially, historically and ideologically. Rich as many of these efforts are, they rarely come close to displaying the 'captivating power' exemplified in the creative writing classified as dalit literature.

\* D.R. Nagaraj recently passed away at the young age of 44. *The Flaming Feet* is the only book he wrote in English. This review was first published in *The Book Review* in May 1994.

Approaching as they do the subject of their concern from the vantage point of the outsider, they fail to break through the cultural barrier encoded in the self-expression of the victims. Even Tendulkar's plays or Bhairappa's 'Ullanghan'—rich as they are in exploring the contradictory impulses of the dalit psyche, remain in the end, voices of the disengaged outsider.

It cannot be denied that even those sympathetic to dalit urges for cultural and political self-expression, have been more than a little dismayed at the sorry state of dalit politics, particularly in this century. Be it the various expressions of the non-Brahmin movement in Tamil Nadu and Karnataka; Ambedkar's attempts at floating a political party or leading his community outside the fold of Hinduism; the numerous factions of the Republican Party or the Dalit Panthers and their fractious wrangling; even Kanshi Ram and his BSP—the era of a cohesive, militant and socially inclusive dalit politics still seems a distant cry. It appears too consumed by rage, a self-destructive hate, even a leadership willing to be suborned by mainstream, upper caste politics. All we need is to observe the political trajectory of mainstream dalit leaders—from Babu Jagjivan Ram to Ram Vilas Paswan.

Central to the dilemma of dalit politics are the spaces occupied by Gandhi and Ambedkar, undoubtedly the major influences on dalit consciousness in the 20th century. D.R. Nagaraj's little booklet, a collection of six essays, is one of the more creative attempts by a self-confessed fellow-traveler of the dalit movement to explore different facets of the Gandhi-Ambedkar relationship in terms of the legacy it leaves behind.

Most observers have tended to look at Gandhi and Ambedkar as polar opposites, with the former, given his unique position in our freedom struggle, not just winning out in the Poona Pact but indelibly marking the future of dalit politics in a framework of incorporation and compromise. Little wonder that contemporary dalit militancy is marked by a rejection of Gandhi.

Somewhat differently, Nagaraj argues that Ambedkar, while troubled by Gandhi's framework and views, was transformed by him. So incidentally was Gandhi himself, a fact rarely recognised. One grid on which their differences can be located rests on an understanding of 'self-purification vs self-respect.' Nagaraj sees Gandhi as located primarily within the former stream—of completely rejecting untouchability as evil while holding onto the caste system and *varnashrama dharma* as a non-negotiable part of his legacy. His was a quest of combining an earlier

tradition of the indigenous radicals who stressed spiritual requirements with the political/cultural requirements of combating colonialism. Gandhi clearly saw that confronting social injustice via withdrawal and creating one's own cult, a process symptomatic of many religious reformers, was insufficient in a situation where the inner resources of Hindu tradition were deformed by the colonial encounter. For him the task was one of transcending/annihilation of the caste-ego.

In contrast, the non-Brahmin movement's response to the caste system was secular and materialist, using a mix of organisational strength and constitutional methods to promote upward social mobility among the dalits. Unfortunately this strategy only led to the creation of an incorporated elite, cut-off from their less fortunate brethren. It led to what Nagaraj calls 'willful amnesia' towards their own past. Further, it fostered a cultural inertia, a lack of appreciation of the religious-cultural quest for identity. Ambedkar was critical of this tendency in the dalit movement while simultaneously rejecting Gandhi's insistence that dalits remain within the Hindu religious and cultural fold: a classic disjunction between the positions of a 'troubled insider' and a 'struggling victim'.

Nagaraj explores the contradictions in both views by looking at the temple-entry movement. At one level there was the irreconcilability between the Gandhian/Vaishnavite veneration of the temple and the anti-temple stand of radical spiritualists, including Tagore. On the other was the dalit dilemma that in supporting a temple-entry movement it simultaneously extended support to the very symbolic structure it was fighting. Was this why Ambedkar's Mahad struggle for the untouchable's access to public water in 1927 was more successful, for it could more easily be posed as a civil rights issue?

The same kind of problem is evident in the conceptualisation of the village—for Gandhi the basis of building a non-western republican India; for Ambedkar the cesspool of Indian civilization. Gandhi, while prescient in his critique of modern western civilization with its urban-industrial bias, never quite understood that for the dalits there was no possibility of justice in the village and under a panchayat. Equally, to remain in the village meant remaining tied to the same humiliating occupations that had so far been their fate.

Nagaraj is brilliant in his analyses of the collapse of restraint and the consequent recourse to violence that marks village society when it comes to handling the question of untouchables. In looking at three different

kinds of struggles around rights—structural (land, water, forests); equal space (public spaces); and cultural space (temples and religion)—Nagaraj lays out the different stances needed in the different contexts. He also points to the contradiction between the dalit demand for control of structural resources and the environmental movement which advocates community control over communitarian resources. Coming back to Gandhi and Ambedkar—the former's village was metaphorically located in an idealised past; the latter's village was one that never was. It is thus that one remained a critical traditionalist; the other a critical modernist.

It is, however, in pointing out that dalit self-confidence inevitably generates a fear in caste Hindus, thereby raising the spectre of retaliation, that Nagaraj locates a major limitation in Ambedkarite ideology and politics. Assertion by weak and dispersed communities (dalits) can and does lead to retaliatory violence by the powerful (caste Hindus)—a process that we witness every day.

The essay on cultural memory, similarly, analyses the weakness of the Gandhian position—where invoking Hindu reform, a return to the village, a restoration of dignity to dalit occupations and so on—only ends up creating a 'harijan'—a position that the movement of untouchables rightly seeks to reject. This ostensible contradiction between the demands of a bruised and battered whole (Hindu society) seeking autonomy and dignity in an unjust world (the Gandhian project), and the requirements of a subjugated and violated sub-stratum which sees its future only in standing apart (the Ambedkarite legacy), is a dilemma still waiting to be resolved.

This is beautifully captured in the remaining three essays on Kannada literature, where the differences between the radical/reformist upper caste ideologues sensitive to dalit suffering and urges viz Anantha Murthy, and a Dalit voice *à la* Devanoor Mahadeva are sought to be explored. In the end, the tension remains unresolved. But we, as readers, have in the process of accompanying Nagaraj in his explorations, been sensitized to dalit consciousness to a degree greater than before. Maybe now we will be less prone to be judgmental when confronted with the vagaries of Dalit behaviour. As Edward Said once wrote in the context of the Palestinian-Israeli encounter, 'We are the victims of the victims of a holocaust.' The dalit is the victim of the victimized Indian.

**Harsh Sethi**

**TOWARDS A NON-BRAHMIN MILLENNIUM:  
From Iyothce Thass to Periyar** by V. Geetha and  
S. V. Rajadurai. Samya, Calcutta, 1998.

Periyar E. V. Ramasamy Naicker, the high priest of the Dravidian Self-Respect movement was said to have exhorted his followers that if they came across a Brahmin and a snake at the same time, then the Brahmin should be killed and the snake spared. There is no statistical evidence to show whether the snakes in the Indian subcontinent account for more than three per cent of the Tamil population. But there is definite proof that the Brahmin constituted a 'mere 3 per cent of the Tamils.'

Civil liberties activists are unlikely to endorse Periyar's advice. S. V. Rajadurai (K. Manoharan) has been active in the movements for civil liberties and democratic rights. A well-known Tamil writer, for long involved with the radical left, Rajadurai's interests range from politics, philosophy and sociology to religion, literature and the arts. Rajadurai remains the intellectual-activist, so necessary in radical movements to educate the emotions of the 'activist' as well as to infuse feeling into the erudition of intellectuals.

V. Geetha and Rajadurai have delved deep in a much neglected area of scholarship and the intensive research towards their vision of a 'non-brahmin millennium' is a pioneering exploration presented with a passion that only admittedly sympathetic interlocutors can generate. It analyses the non-brahmin movement from its origins at the end of the 19th century to EVR's movement in the late '30s with both a vigour and viciousness missing in earlier writings on the subject. It celebrates the 'wonderfully carnivalesque denunciations of caste, brahmin priesthood and the nation', and (one might add) religion, nationalism and the Hindu.

The '3 per cent Brahmins' are identified and pilloried as the root of all evil-hegemonic tyranny, regressive social practices, suppression of rights and freedoms, repressive exclusion of the non-brahmin majority, usurpation of the leadership of the nationalist movement, revolting narcissism, inhuman selfishness, ruthless protection and pursuit of self-interest, perfidious perpetuation of entrenched authority and privilege, and every manifestation of Manu, Machiavelli and Mephistopheles and the meanest conceptions of the human race.

Of course, the Tamil Brahmin (3 per cent) is also the 'South Indian Brahmin', the 'Hindu', the 'Aryan', the 'foreign invader', the 'alien interloper' the anti-

Tamil, and the Sanskrit-propagating forerunner of the Hindi imperialists of the 'bania-North'.

At the other end of the order, dominated (during British rule) by an authoritarian patriarchy of self seeking Brahmins, were the Tamils – non-brahmins who knew no antagonisms arising out of social, heirarchical or religious distinctions. This 'land of the Tamils had once been most democratic in spirit in more sense than one.' In this ancient, highly evolved and egalitarian Tamil country with 'its hoary civilisation and culture' had descended the brahmins, who like pestilential locusts were 'alien interlopers and foreigners.'

Fürther, the 'so-called panchamas were the original inhabitants of this vast subcontinent, who had been cast out of history and relegated to the fringes of society with the historic defeat of their Buddhist faith by Aryan-brahmin invaders.' This invasion, which brought the scourge of caste and untouchability, led to the demise of the 'original Dravidian culture', a glorious and now-forgotten past 'when Tamils had lived far and wide in the subcontinent and achieved a level of culture unmatched by anything that succeeded this golden age.'

Trapped in between were the British, that splendid specimen of humanity, who were untainted by prejudices of caste, colour, creed or religion, never in the least given to any kind of divide-and-rule policy. But for this supremely secular and fair-minded master race, which was deeply moved by the subjugation of the non-brahmins but manipulated by the Brahmins, the struggles of the undercastes would have gone unaided. Little wonder that the non-brahmin movements not only preferred the hegemony of the British to that of the Brahmins, but actually pleaded and politically worked overtime for perpetuating the Raj. By the way, Netaji Subhash Chandra Bose was a victim of Gandhi's bania-brahmin Congress which was opposed to the British. That Netaji's own leanings were towards the Germans, the aggressive and anti-Semitic self-proclaimed Aryans, is too inconsequential a fact to be dwelt upon.

For all its flawed vision and very puncturable postulates on caste, religion, nationalism, non brahminism, and the nature, role, motivations and contribution of the British, the book is an eminently readable account of a pulsating period of the non-brahmin movement. A well-documented and original, even 'creative' enquiry, this expression of the impassioned mission of Rajadurai, undertaken along with Geetha, is refreshingly provocative. The arguments, the definitions

of identities, the analyses, the interpretations and inferences, the wealth of evidence from books, newspapers and tracts particularly in Tamil, is an attempt at a different kind of history, the history of a people who perceive themselves to have been left out because of their unbearable non-brahminness of being.

The patterns of the non-brahmin movement are traced in intimate and loving detail, suffused with the prejudices which are inseparable from such a passionate engagement. The development of a self-validating ideology, the impulses which gave rise to it and the leading players of the Self-Respect movement, all find honourable place in this volume, which can be no less useful to deconstruct and demolish the basis of a caste-free utopia built in this book.

A sequel on the degenerate politics of the Dravidian offspring of the Self-Respect movement, particularly in the last 50 years, would be of immensely greater value and instructive on why and how the self-proclaimed inheritors of Periyar's legacy have got re-brahminised and seduced into flaunting the adornments of a new religiosity. Till this is accomplished, let us not take the Buddha's name – as non-brahmins, neo-brahmins and nuclear-brahmins have increasingly been doing – in vain.

In the interim it might be a sobering thought that the origin and development of caste was not controlled by Brahmins; they were merely clever and cunning enough to grasp that they could exploit the caste system to their advantage; and this they did by making caste-based laws which conformed to their vision of society. It is in the nature of things that ruling groups, makers and guardians of the law, belong to the elite. Despite the shift in emphasis from group and community rights to the welfare, rights and freedoms of the individual, republican values and democratic rights have yet to be actualised.

Consequently, the political, socio-economic and cultural demise of one breed of Brahmins is invariably succeeded by the rule of another class, may be even caste, of Brahmins. That they are not united by caste alone but all the other attributes which entrenched caste-based domination is cold comfort while awaiting, with disillusionment, the dawn of a new millennium. Privilege and power is always sought to be protected. Whether the arguments advanced to achieve this are sacral or political, ethnic or economic, cultural or social does not in any way mitigate the condition of the individual victim.

## NEW FROM OXFORD

### Divide and Quit

An Eye-witness Account of the Partition of India

### Penderal Moon

This book was first published by Chatto and Windus in 1961, and is a classic piece of writing on the period. It is fluently and easily written, more a first-hand account and analysis than a historical tract. Added to the original book are valuable introductions by Mark Tully, and Tapan Raychaudhuri, that analyse the Partition and Moon's role in it, including his book. The new edition also contains 7 pages of rare photographs. A rich and rewarding book for all interested in modern India.

**0 19 564422 0 1998 (OIP) 215 X 140 mm 340 pp. Rs 295**

### The Alternative Leadership: Subhas Chandra Bose

Speeches, Articles, Statements and Letters June 1939 – January 1941

(Netaji: Collected Works Volume 10)

Sisir K. Bose & Sugata Bose (editors)

Volume 10 of his Collected Works brings together the writings and speeches of this crucial phase in Bose's political life immediately prior to his emergence as the Netaji of India's army of liberation. The themes dealt with in his articles and speeches include the role of the left within the Indian independence movement, the Second World War as a conflict between rival imperialisms, and the need for Hindu-Muslim unity and Congress-Muslim League understanding in presenting a joint national demand to the British.

A smile. A teardrop. A raised eyebrow.  
A flare of the nostrils. A frown. These are  
just a few manifestations of a language  
that transcends the spoken word.

Spontaneously communicating  
feelings like ardour, agony, ecstasy,  
excitement, fervour, fright, passion and  
pain. All housed in the human body and  
triggered by amazing chemical reactions

Devotion and dedication have enabled a  
handful to master the art of self-expression.  
Fostering it to perfection. In the visual arts,  
the performing arts, music and dance.

At Herdillia, we've also devoted  
over two decades perfecting  
chemical reactions, thereby elevating  
the quality of life. In homes, offices,  
industries and in agriculture.

"It's our way of expressing underlying  
feelings like concern and care. Feelings that  
are an inherent part of Herdillia's chemistry."

Excitement, anxiety, agony  
and ecstasy -  
some amazing chemical  
reactions we all possess

# Backpage

IN the midst of a bleak festive season – continuing recession, dropsy deaths, and spiralling onion prices – there was finally some cause for cheer. Amartya Sen, long regarded as one of the most distinguished practitioners of the dismal science of economics, finally bagged the Nobel Prize. For years he had been a front-runner. But such is the measure of the times that the Nobel Committee preferred to recognise arcane technicians concerned more with the health of the stock market than the welfare of people.

It is indicative that Professor Sen received the news in New York where he had gone to deliver an oration in the memory of Mahbub ul Haq, the Pakistani economist best known for constructing the Human Development Index. Amartya Sen, not only foregrounded the contributions of his late colleague, he saw the award as a long overdue recognition of development economics and of those within his profession who have focused on the perennial but unfashionable problems of poverty, unemployment and distributive justice.

Not unexpectedly, the country went euphoric. We were informed that this was the sixth person from India to bag the prestigious prize. We were reminded that Amartya Sen was named by no less than our first Nobel laureate, Rabindranath Tagore, of his connections to Shantiniketan, of his quiet pride at holding an Indian passport and retaining his Bengali roots.

More intriguing were the hosannas of praise heaped on the economist by different political parties. This when much of Amartya Sen's work and public advocacy encodes a severe critique of our political class and the absence of public welfare in the policies they have espoused. The ability to appropriate and enroll in one's sectarian project is what, one suspects, marks out the malleability and resilience of the politician. Equally, it is evident, that their words of praise are hollow.

How, in particular, the BJP and the Hindutva brigade, could gush over Amartya Sen, and that too after his highly publicised attack on their Ayodhya misadventure, is astonishing. Equally one wonders what the current Congress or even the Left leadership is seeking to prove by cosying up to the economist. Sen, after all, has consistently pointed out the disastrous social implications of underfunding education and health, or to our inability to fine-tune welfarist programmes for class and gender.

As a critical modernist in the tradition of Rammohun Roy and Tagore, Sen has displayed little

patience with many of the formulations favoured by our swadeshi brigade, particularly those valourizing our Hindu past and blaming the West for all our current ills. Our enthusiastic globalisers too have been repeatedly warned that social reform and investment should predate economic reforms.

One hopes that the occasion will nudge our policy planners, as also the political masters, into more seriously re-examining the presuppositions of their favoured recipes. Even the mathematical formulation of much of Sen's work in the fields of social choice theory and welfare economics has always been firmly grounded in the social realities of developing societies. That has been his metier, and it would be a tragedy if we forget it.

A few days before Amartya Sen's award grabbed national headlines, Professor M.L. Dantwala, who had been ailing for sometime, passed away. Few newspapers took notice, what to speak of our many TV channels. M.L. Dantwala, a founder-member of the Congress Socialist party, had long served the economics faculty at the University of Mumbai with distinction. A quiet, self-effacing man, he plugged away at the many (real) problems of Indian society. The Bombay School is marked by its abiding interaction with both the farming sector and industry. Few today who work on the problems of poverty and unemployment, rural credit and cooperatives, can ignore the invaluable contributions of Dantwala and his colleagues. He also helped establish The Indian Society of Agricultural Economics and edited its journal for over three decades, maintaining a consistency and quality rarely seen in Indian academia.

In not remembering Dantwala, the guardians of our public memory have done us a grave dis-service. Building durable institutions and intellectual traditions demands a perseverance, unfortunately in short supply. In his unswerving commitment to seeking realisable solutions to the problems of the poor, an advocacy of austerity and a healthy skepticism about recognition, Dantwala served as an exemplar of the best of our freedom struggle tradition.

We all need to facilitate Amartya Sen and his work. We also need to remember the Dantwalas. Without the latter, we cannot hope to institutionally ground the message of the former.

**Harsh Sethi**

## CARING TODAY FOR YOUR TOMORROW

Our children, our future, need the utmost care. And at Hero Honda we care.  
For you, your family and the environment.

Hero Honda's superior 4-stroke technology and its high fuel-efficiency makes it  
one of India's most environment-friendly motorcycles.

Little wonder, then, that today over one and a half million proud Hero Honda  
owners are making an impact on our environment across the country. Ensuring a  
brighter and a pollution-free tomorrow for the future generation.

Ride a Hero Honda. And show the world that you care.

**Interest calculation to your advantage**

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

**No prepayment penalty**

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

**No annual charge**

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

**No commitment charge**

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan – not before.

**Processing charge on a 'slab' basis**

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

*Loans at the sole discretion of ANZ Grindlays Bank.*

**Interest calculation to your advantage**

We apply your interest on a daily balance, and not on an annual reducing balance. A simple calculation that reduces your Equated Monthly Instalment (EMI) and saves you thousands!

**No prepayment penalty**

We won't make you pay for repaying us early! There is no penalty in case you decide to prepay your loan.

Our  
home loans  
let you save in  
so many ways,  
we don't know  
where to start.

**No annual charge**

No annual shocks! Unlike most others, we don't have any annual charge. Again, a considerable saving.

**No commitment charge**

Why pay for something you haven't received? With Home Loanz, you start repaying only after you get your loan – not before.

**Processing charge on a 'slab' basis**

We apply our one-time processing charge on a 'slab' basis, and not as a flat percentage of your loan amount. Which means a substantial saving for you!

All in all, you can't find a home loan that allows you to save in so many ways. So, for any amount from Rs 2.10 lakhs to Rs 1 crore, do call us today. Now that you know where to start.

This is 3 year old Shreya.  
Her parents abandoned her.  
and vanished. If you turn the page,  
you'll do the same.

With no one left in the world, little Shreya doesn't have the slightest hope of facing the future, unless she gets an education. And that's where you come in. To make a dream called *Nanhi Kali* come true. Through *Nanhi Kali*, you can become the foster parent of a little girl like Shreya. By giving Rs. 100 a month towards her education, your 'daughter' will be put into school and in fact, you will receive regular reports about her progress including a photograph. *Nanhi Kali* is a special project of the K.C. Mahindra Education Trust - a Trust set up by one of the most reputed industrial families in India. A Trust that's been working since 1953 to promote education and enlightenment across the country. Since *Nanhi Kali* literally means 'little flower', with people like you, we hope to repair the broken petals of thousands of such underprivileged little girls.

So please don't turn the page yet.

Supported by M/s. Mahindra & Mahindra Ltd.

ON the completion of 50 years as an independent country, India faces a transformed world. The terms of reference of India's interaction with the international community stand profoundly changed. Great power ideological confrontation has come to an end. National sovereignty and national insularities are being subsumed by the process of economic globalisation. The information technology revolution is progressively reducing the relevance of international frontiers between nation states. The strategic equations and the chemistry of power which underpinned international relations for half a century since the end of World War II have been replaced by new equations.

India and many developing countries have lost the leverages which they exercised in foreign policy and strategic matters over the last 50 years because of the disappearance of the Soviet Union and the centripetal qualities characterising the relations between the five great powers, the permanent members of the Security Council. It is in this context that one tries to perceive the challenges to India's foreign policy into the first decades of the 21st century.

International relations, like general processes of history, defy attempts to force their flow into predetermined theoretical patterns or preconceived logical grooves. Prognoses in foreign policy cannot be strait-jacketed in *a priori* generalisations. When discussing the future of international relations or challenges to our foreign policy, we are dealing with the complexity of

human emotions, the involutions of human motivations and the ambiguities and uncertainties of the political and socio-economic impulses which underpin them. Foreign policy's eternal challenge is to deal with the unpredictability of inter-state and inter-societal relations. International relations will remain involuted, subject to wayward human behaviour. They are baroque, in a manner of speaking.

It is with a profound awareness of this limitation that I undertake the speculative exercise about the tasks facing India's foreign policy in the 21st century and the challenges that we would face.

At the most fundamental level, the challenge that India as well as other members of the international community face is to resolve a basic contradiction affecting the prospects of human survival. This contradiction is best expressed in the debate between philosophers and socio-economic theoreticians about the perfectibility of human beings. Such a debate and its repercussions marked the end of the 18th century. On the one hand was Thomas Robert Malthus, who posited that growth of populations is indefinitely greater than the capacity of the earth to produce sufficient subsistence for human beings – that while population increases by geometrical progression, productive capacities increase only in arithmetical progression. Social upheaval and instability, therefore, are the predetermined future predicament of mankind.

## The problem

As opposed to this theory, scholars such as Antoine Condorcet and William Godwin argued that the growth of human understanding, the increase in capacity for self-improvement, and the breakthroughs in technologies and knowledge would one day lead to a more equitable world where people would live free from crime, disease, war and want. Developments over the last 200 years have proved Malthus' analysis of the population to productivity ratio right but his dire prophecies to be wrong. At the same time, while the Godwin and Condorcet prognosis has proved to be right, their questioning of Malthus' theory about imbalance between population growth and productivity has proven to be wrong. Populations have increased in geometrical progression while productivity has been increasing at lower rates. Nevertheless, there has been an increase in the human capacity for self-improvement and unexpected breakthroughs in knowledge and technology have made the world a progressively more equitable and comfortable place to live in.

As the future inevitably originates in the impulses of the past, it would be pertinent to confirm the preceding positive assessment through some specifics. Trends since the middle of the 19th century till now, when we are on the threshold of the 21st century, clearly indicate that the world is more egalitarian. The information technology revolution and the consequent increasingly expeditious access to information, combined with the emergence of user-friendly technolo-

gies, has resulted in the increasing empowerment of individuals.

The levers of power are increasingly in the hands of average human beings all over the world, compared to the earlier monopoly of oligarchies or plutocratic elites in different societies and states. Political colonialism has disappeared; so has slavery. There is universally a greater shared concern about human rights. There is also an increasing awareness that the world's natural resources should be exploited and utilised in a more equitable manner while, at the same time, being subject to the imperatives of ecological balance and environmental protection. Discrimination based on ethnicity, language and race, which characterised the attitudes and policies of different states and societies, depending on their military and technological strengths, are now subject to the moral pressure of international public opinion and the political and legal pressures of the norms of international law.

The power structure of nation states is going through a metamorphosis. Nation states, as they evolved since the Treaties of Westphalia, signed in 1648, are now subject to the pressures generated by the economic and technological globalisation of the world. Their relevance in the conventional sense of the term (nation state) and their claim to unqualified sovereignty are now in question. Socio-economic interdependence between different countries, the democratisation of international politics, the disappearance of the Cold

War antagonism and the incapacity of national boundaries to compartmentalise the flow of ideas and information have resulted in the requirement of nation states to redefine their respective identities.

There are also certain strands of emerging conventional wisdom in international politics, the logic and validity of which must be examined when determining the problems and challenges that India would face in fashioning its foreign policy and structuring its external relations. The first of such strands is the proposition that the world has become unipolar and that there is likely to be 'Pax Americana' for the next 100 years or so. One does not question the fact that the United States will be the most dominant factor in world politics for quite some time to come, but in terms of technological capacities, access and control of natural resources, population strengths and economic determinants of investment opportunities and markets, the world is bound to be multipolar with other power centres being Western Europe, the Russian Federation, China, Japan, India and some strong regional arrangements if they were to emerge in South America and Africa.

A major task for India would be to nurture its economic and technological capacities and to increase its political stability and military capability to levels where it can elevate itself to a position of strength to network an equilibrium with the new power centres of the emerging multi-polar world. There are indications that an atmosphere and an opportunity for such networking now exist.

Then there is the theory about the world facing confrontation based on religious and civilisational identities of different societies. I am referring to the Samuel Huntington thesis about the clash of civilisations; a fashionable reference point today to speculate on the future of inter-state relations. This theory is of particular relevance to India because Huntington visualises our country being in a state of isolation because it is neither Islamic nor Christian. He visualises an India without allies or natural external political support systems. His theory is of intriguing interest because while he talks about India's potential isolation, he prognosticates that there would be a collusion between Confucian and Islamic civilisations, against the Western, Christian and Judaic civilisations.

One has to deeply ruminate on the predicaments envisaged by Huntington. Though one disagrees both in fundamentals and in detail with Huntington's theory about the clash of civilisations, one would agree that he has contrived and presented a challenging frame-

work to evaluate some of the emerging realities of global politics into the 21st century. He has certainly succeeded in being provocative and, to that extent, his book has some relevance. Looking at the statistical tables and the political interpretations of Huntington's thesis, one gets the impression that the provocation for this work perhaps originated during or immediately after the 1991 Gulf War in which the United States' military assertiveness against Iraq was perceived as a religious confrontation by segments of US academia.

The reason for my lengthy and critical evaluation of the Huntington thesis is that inherent in it is one of the overarching and fundamental challenges that India's foreign policy will face in the coming century. While the thesis is definitionally flawed and based on *a priori* confrontationist motivations, it brings out in relief the fact that India, the South East Asian countries (such as Thailand, Burma, Vietnam, Laos and Cambodia), China and Japan are not part of the broad religio-cultural categories which may dominate the power equations. India particularly, because of its plurality and being a composite of practically all the major religions and cultural groups of the world, does not easily fit into the Christian-Judaic or the Islamic camp.

Indian foreign policy, therefore, would have to facilitate our country's integration with one of the camps visualised by Huntington, if his thesis is correct. This will not be easy because the Hindu majority in India is a very India-specific phenomenon. The 120 million Muslims in India, whose numbers may increase to 250 or 300 million in the next century, would generate pressures for developing equations with the Islamic world. The other religio-ethnic identities of India may generate contradictory pressures towards the other camp. The prospect to be alert about, and to be consistently monitored, is that such pressures are not generated. The concretisation of this prospect occurred in the break-up of Yugoslavia on ethnic and religious lines. The break-up of the Soviet Union was the result of other impulses, but the phenomenon of ethno religious separation afflicting the Russian Federation and Georgia provide warning signs to be taken note of by India.

Another dimension to this challenge is that, with the disintegration of the Soviet Union and Yugoslavia, the sanctity of maintaining state structures of plural societies, characterised by diversity, stands eroded. If such societies do not have the inner discipline, the required levels of justice, and if they do not have the defence capacities to sustain themselves, the other power centres of the world would not be supportive of

their unity and integrity. In fact, a disintegration of such state structures could be perceived as making the world a more manageable place by the more powerful, more cohesive and economically advanced countries in the international community. India's foreign, political, economic and national security policies should be pre-emptively responsive to this challenge.

Before turning to the specific tasks on which Indian foreign policy should focus, it would be pertinent to analyse broad trends which would characterise international relations in the coming decades and the motivations of the important powers of the world which would underpin them.

Emerging trends make it obvious that international relations would be dominated by the industrially and technologically advanced countries led by the United States well into the 21st century. The first objective of these countries would be to create an international political system in which states and civil societies would be structured on the basis of political and economic terms of reference acceptable to the US and those world powers which would be responsive to their interests. State systems governed by democratic trans-Atlantic terms of reference would be sought to be established. The individual social requirements, traditions and cultures of the countries of Africa and Asia will be questioned and they are likely to be diminished. Political and economic pressures, even coercive pressures, may be generated for this purpose.

Second, regardless of the claims regarding an emerging equitable and fair economic order, the orientations would be to create a globalised free market economy in a manner in which the advanced industrial countries would remain dominant and influential. Controversies which have arisen after the signing of the Marrakesh Agreements in March 1995 and the additionalities regarding social clauses, intellectual property rights and the time frame for speeding up the implementation of the WTO's export and import regimes confirm this prospect.

The third phenomenon characterising world politics would be the orientation of the foreign policies of the important powers to maintain and acquire access and control over raw materials and natural resources of the world, especially of infrastructural, economic and strategic importance such as oil, natural gas and minerals. The alertness with which this objective is attended to was first indicated in the speed with which the former US Secretary of State James Baker visited Kazakhstan to negotiate his country's entry into the Kazakh economy, even before the revised arrange-

ments of relations between the CIS (Commonwealth of Independent States) and the Russian Federation were finalised in the aftermath of the break-up of the Soviet Union (in 1991-92).

Another example was the alacrity with which a consortium of businessmen from the USA visited Congo in the summer of 1997 when Mobutu was about to be ousted from presidency by a military coup. These businessmen entered into negotiations with leaders of the anti-Mobutu forces and paid an advance of \$3 billion to them for long term access to the natural resources of Congo. The basic aim was clear: that advanced countries should not fall short of essential raw materials, nor should their pre-eminent economic position be eroded.

The fourth characteristic of international relations which India would have to cope with is the objective of the industrially advanced western countries to maintain long-term exclusive control over sophisticated technologies. Regimes governing the transfer of higher technologies being put in place since the beginning of the 1980s have sent out a clear signal that the industrialised advanced economies consider unrestricted transfer of technologies to the developing countries a threat to their capacity (i.e. of the industrially advanced countries) to maintain a competitive edge over the majority of countries of the world.

The emphasis on the concept of 'dual use technologies' and the anxieties that such technologies should be made available to the developing countries under restrictive and discriminatory disciplines and subject to strict safeguards establish the validity of the assessment regarding the acquisitive motivations of the more important powers which I have mentioned earlier. This restrictive approach has manifested itself in the export policies of the advanced countries regarding supercomputers, computer hardware, higher electronics, lasers, robotics, genetic engineering, and technologies related to the management and utilisation of biodiversities.

This acquisitive competitive approach goes beyond the transfer of technologies originating in these countries. The manner in which certain aspects of intellectual property rights and international standards for the patents clause are sought to be structured militates against the traditional capacity as well as the self-reliance of developing countries. The struggle which India has engaged in to prevent western entrepreneurs from patenting the use of neem and turmeric for medical and health purposes is a case in point. These items have been used as ingredients of traditional medicines

and healthcare in India for hundreds of years. The move to claim royalty rights and economic returns on the use of these items under new names and new packaging patented in the West is a blatant attempt at intrusive exploitation. This phenomenon is not going to abate. The processes of globalisation will be used as an excuse for such purposes.

The discriminatory and restrictive approach regarding the transfer of technologies will fundamentally affect the capacity for self-reliance, productivity and the ability to produce quality goods in the developing countries. The competition generated by a free market economy can be useful and relevant only if it ensures fair play, equity and justice in international economic transactions. Though this is the declared rationale for adhering to the mainstream of international economic trends, in certain dimensions, the actual development indicate intentions to the contrary.

That meeting the aforementioned macro-level, political, economic and technological objectives necessitates the US and other important powers of the world to maintain their military and technological superiority over a majority of the countries of the world is not just an undeclared objective, it has been articulated. Statements made by former President George Bush and President Bill Clinton and by leaders of the European Union and to some extent, even of the Russian Federation since the end of 1991 and beginning of 1992, have expressed the following views:

The new world order should aim at preventing the emergence of militarily powerful countries (except those which are already militarily powerful and nuclearly weaponised) as regional or sub-regional hegemonies. (A corollary of the preceding view is the insistence on discriminatory non-proliferation of various kinds of weapons of mass destruction and insistence on reduction of conventional forces and conventional armaments). The national and regional export control policies of the advanced countries back up this objective of multifaceted restrictive regimes controlling the transfer of technologies.

The introduction of the concepts of 'irresponsible' states and 'rogue' states into the lexicon of international law and foreign policy is part of this exercise. To be candid, except the United States and Iraq, no other country has used weapons of mass destruction without provocation on civilian populations. The inclination to apply this label to other countries on the basis of political motivations, other than the objective criteria developed by the UN, should be noted.

The policy of restricting the military and technological capacities of countries which do not fully conform to the stipulations of the great powers is not just a political stance. This stance has found operational expression in the last three decades of the 20th century. The attack on Osirak nuclear facilities in Iraq by Israel, the fulfillment of Henry Kissinger's warning to Zulfikar Ali Bhutto that his nuclear weaponisation policies would lead to disastrous consequences for him (for Bhutto), the US's coercive stance on Iraq in 1990 and 1998, and the airstrikes on Libya in the 1980s prove this point.

It is also significant that US officials, while mounting military pressure on Iraq in January/February 1998, articulated the view that the policies towards that country were not just aimed at Baghdad, but they were also a signal to other countries which may have inclinations to acquire weapons of mass destruction; whatever their security concerns or justifications may be. These US officials further expressed the view that those countries which do not abide by stipulated international disciplines on non-proliferation matters should be ready to forfeit their sovereignty, if necessary under pressure of superior military force.

The expectation that, after the disintegration of the Soviet Union and end of the Cold War, the UN would become stronger, more democratised and play a more effectively impartial role in ensuring world peace and stability, has not been fulfilled. The UN, at least during the 1990s, has become more of an instrumentality of foreign policy objectives of the five permanent members of the United Nations Security Council and particularly that of the United States. The UN has been used either as a cosmetic umbrella, or a fig leaf, for the USA's political and military moves in reordering the world with the support of the other important powers.

The manner in which the crises in Yugoslavia, Somalia and Iraq were handled leads one to this conclusion. If we add to this list the powerful multilateral financial institutions operating on the policy orientations of western advanced countries, it becomes obvious that the emerging world order would remain subject to the overarching influence of the United States and that it will remain unfairly competitive and acquisitive.

While countries such as the Russian Federation, Japan, China and, to some extent, France and Germany may be able to counter the aforementioned trends on specific issues related to their respective national interests, the rest of the world would have to succumb and adjust, unless new patterns of strategic under-

standings emerge and new power equations are established between some of these powerful countries and the more important developing countries such as India.

One must also mention, in parenthesis, the likely framework of UN reforms. While the Security Council may be expanded with the addition of some more permanent members, it will be dominated by the European powers. The existing five members will retain their veto while the new permanent members are unlikely to be given this power. The advocacy or abolishing the veto will not get a positive response. The developmental and economic role of the UN will progressively shift away from it and will be concentrated in the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (The World Bank).

International commercial and technological arrangements will not only technically, but also politically, fall within the jurisdiction of the World Trade Organisation (WTO). A beneficial development in some respects, it could, however, be disadvantageous if the WTO were to toe an entirely western line.

The increasing empowerment of peoples worldwide, generating democratic political impulses, combined with the speedy facility of obtaining almost unrestricted information, will generate significant centrifugal forces in those societies which cannot cope with the rising social and economic aspirations of their peoples. These centrifugal forces will find expression in ethno-religious or linguistic movements within state structures, threatening their very stability and unity. On the other hand, countries which are successful in economic management, and in creating a satisfactory quality of life, would become part of the centripetal arrangements of the type exemplified in the European Union and the NAFTA (North American Free Trade Association). I would have mentioned APEC (Asian Pacific Economic Cooperation) and ASEAN (Association of South-East Asian Nations) also, but given the economic upheavals that have affected ASEAN since the middle of 1997, I exclude them from these centripetal orientations for the present.

These then are the broad trends in the international situation that India's foreign policy would have to deal with well into the 21st century. The capacity of our foreign policy to cope with the complexities which I have mentioned is inextricably linked with our current politico-economic and social predicament. The positive ingredients of this predicament during the little more than 50 years of our existence as an independent country are that we remain committed to car-

rying on the processes of national consolidation and government through democratic means.

We have ensured food security for our unmanageably vast population. Despite our intensive diversities we have managed, though just barely so, to maintain our political cohesion and unity. Barring the loss of territory at the end of the 1962 Sino-Indian war, we have sustained our territorial unity and integrity. We are endowed with natural resources and technologically qualified manpower though the latter has not been developed to its optimum potential, nor has it been utilised as judiciously or as effectively as we could have.

There has been a general consensus with regard to perception of our national interests and foreign policy orientations. Despite the shortcomings in our foreign policy and critical perceptions about us in the countries of the region and in the international community at different points of time, we have sustained a practical working relationship with most of our neighbours and with a majority of the countries of the world. Even where there are abiding adversarial relations with one or two of our neighbours, we have managed to prevent them from degenerating into military confrontation, at least over the last two and a half decades of this century.

On the negative side, first, we have to acknowledge that the quality of politics in India has declined in many vital respects. Second, the efforts at national consolidation and reconstruction have made slow progress. We have failed to achieve the minimum required standards in the fields of education, public health and infrastructural economic capacities. We rank rather low if we apply the international 'quality of life' index to our society. We are subject to a rising curve of ethno-linguistic and religious fissiparous and secessionist tendencies. Despite being conscious of the imperative requirements of national security, our defence capacities remain inadequate.

Above all, we have not been able to cope with the unmanageable increase in our population. The most optimistic estimate is that by the year 2050, India's population will stabilise around 1.5 billion. If we add to this figure demographic pressures that may be generated on us by a population of nearly 300 million in Bangladesh and between 270 and 320 million in Pakistan at that point of time, the consequent political ramifications are daunting.

While we have managed to maintain a tenuous normalcy in relations with most of our neighbours, they remain subject to undercurrents of tensions related to specific issues or the perceptions about us in the neighbourhood regarding our hegemonic intentions. We are

afflicted by a general ambiance of indiscipline and lack of national purpose. We are generally considered a soft state with the additional problem of our exaggerated sense of self and our unrealistic desire to be acknowledged as a leading nation unrelated to the perceptions about our political stability, or the substance of our economic, technological and military power.

This listing of inadequacies was necessary as they constitute a barrier of limitation on our capacity to structure a foreign policy capable of meeting the challenges ahead. What then are the tasks ahead? And what can we do to fulfill them? First, the short and medium-term objectives to be attended to. Ensuring the continuity and territorial integrity of the Indian Republic is a matter of the highest priority in this respect. The certainties which animated our national struggle for freedom and the initial idealism about India's national unity stand eroded with the passage of time. Ethno-centric, linguistic and religious centrifugal tendencies have challenged Indian unity, be it in Jammu and Kashmir, Punjab or the North-Eastern states. These tendencies, combined with territorial claims of neighbouring countries such as Pakistan and China, remain a threat. Though we have generally preserved our territorial integrity and are structuring equations with these two countries to prevent territorial alienation, fissiparous forces, undeniably, exist.

The foreign policy dimension of the problem is that such forces find encouragement from foreign countries and foreign sources. The threat is not limited to claims articulated by neighbouring states such as Pakistan or China, but forms the undercurrent of orientations in strategic policies of important countries such as the United States and the more cohesive nation states and regional groupings. Maintaining durable peace and equilibrium in power equations would be easier if the international state system did not have to cope with large geopolitical entities or states endowed with economic power and military strength competing with each other.

Whatever the superficial analysis and arguments about the disintegration of the Soviet Union and Yugoslavia may be, one substantial dimension of their fragmentation was the strategic planning and political encouragement rendered to the process by western powers led by the United States. Breaking up two pluralistic states with a sense of self, one of which was a superpower, was the practical application of the objective of politico-strategic domination or pre-eminent influence of the western camp.

The same motivation is reflected in the foreign policy approach of the United States and Russia in con-

taining China and subjecting it to multilateral international disciplines and regimes. The deeper motivation in generating pressure on Iraq, as well as in keeping it isolated, and in questioning the long-term viability of India remaining united is the same.

Our foreign policy would have to assiduously create a regional atmosphere and equation with important power centres of the world which would prevent external encouragement to the inherent centrifugal tendencies affecting our polity. This step would involve an imaginative responsiveness to the aspirations of different segments of the Indian people and nurturing at least a non-adversarial, if not friendly, relationship with our neighbours and establishing a pattern of relations with important power centres of the world within the framework of which they will perceive a united India serving their broad economic and strategic interests. There will have to be decisive, even coercive, resistance to separatist forces originating from other countries and foreign agencies. This is not an *a priori* predication that India will continuously face a confrontationist situation with the international community. It is only emphasising that we must be aware of undercurrents of political realities in evolving international equations.

The second important objective of India's foreign policy would be to ensure an atmosphere of peace and stability in which India can focus on its economic development and can also cope with the complex problems affecting the well-being of our people. This process would involve not only the fashioning of an appropriate domestic economic policy, but also the formulation of a 'foreign economic policy' which would ensure the necessary financial, technological and foreign trade inputs to meet India's developmental requirements in the broadest sense of the term.

In terms of present calculations, India needs an investment of roughly \$80 billion per annum in the infrastructural sector of its economy (energy, surface transport, ports, power generation, telecommunications and so on). Moreover, foreign policy has a vital role to play in creating peace and stability in our region and ensuring India's image as an attractive economic partner in the process of global cooperation to meet the aforementioned objective. The technological dimensions of our foreign economic policy should particularly focus on enhancing technological potential and on increasing India's capacity for self-reliance in science and technology.

The third objective would be to create national defence capacities to protect India's unity and territorial

integrity, a capacity which should primarily rely on our resources and our own technologies, but which should also be based on a balanced and sufficiently diversified pattern of external inputs in a manner wherein India does not become excessively dependent on one country or the other or one group of countries or the other. This precautionary step would involve calibrating our nuclear weaponisation and missile policies and those related to the structuring of the three wings of our armed forces on lines which would be responsive to changing international power equations and technological developments.

The overall aim should be to nurture and develop our strengths without confrontation and without being isolated to the extent possible. This exercise would involve diplomatic skill, tact and flexibility of the highest order in the context of the developing international situation where the more important powers are aiming at fashioning a world order which will perpetuate their pre-eminent position.

The fourth objective would be to strengthen regional cooperation and to work for mutually beneficial equations between the South Asian and other regional groups and associations, so that regional cooperation becomes an instrumentality not only for peace and stability but also for long term security and economic well-being.

The fifth objective would be to strengthen the UN, its organs and specialised agencies keeping in mind two goals: first, to enable the UN to truly reflect the interests and aspirations of majority of its membership and, second, to restrict to the extent possible the UN becoming an instrumentality of superpower policies. All issues affecting reforms should be dealt with keeping these goals in mind. This task will not be easy, given present indications of UN reforms being undertaken in a selective and elitist manner based on the orientations of the more influential powers. India beseeching a permanent seat on the security council is not a solution.

India must endeavour to be strong enough in every respect, attract sufficient voluntary support from the general membership of the UN and, based on this strength, be an influential voice at the UN. As this process will take time, in the interim phase, India should use its influence to make the UN more democratic by advocating the cause of greater representation for the smaller countries in the important organs of the UN and its agencies.

The sixth task would be to undertake the necessary organisational and institutional reforms in the

Ministry of External Affairs and in the Indian Foreign Service to enable the foreign policy establishment of India to fulfill its required advisory and executive role to meet the following objectives. This initiative would involve the modernisation of recruitment methods, concentrating on area and functional specialisation, and facilitating lateral inclusion of specialists of different categories in the foreign service. These steps would also involve the creating of institutional mechanisms for interdepartmental coordination and consultation within the GOI and between the central and the state governments to meet foreign policy objectives at given points of time. Creation of a National Security Council and the post of a National Security Adviser with clearly defined responsibilities and powers should be an essential part of this exercise.

The seventh short or medium term task would be for India to focus on managing its relations with Pakistan and China, so that the inherent tensions in its relations with these countries do not affect our vital interests. Also, a special relationship with the United States, Russia and Japan should be fashioned in the context of their undoubted political influence and economic clout which is likely to last into the 21st century.

Having speculated on the short and medium term objectives and the required responses to meet them, it has to be emphasised that the nature of the challenges and India's response to them would evolve in the context of broad trends in international relations. These trends at the end of the 20th century have been touched upon in the earlier section of this article. The next obvious question would be: on what lines would these trends evolve in the first years of the 21st century? One can only speculate.

The possibilities are that nation states would have to reluctantly give up some aspects of their sovereignty, thereby facilitating international supervision and monitoring of economic, political, technological and military phenomena. The system of monitoring would be determined by the important powers and managed by them. The UN would be marginally strengthened and democratised, but it would function mostly under the influence of the United States and the western democracies. But nation-states would still need their own economic and technological capacities as well as armed forces for safeguarding their vital national interests.

The nuclear weapon states may agree to some kind of time-bound nuclear disarmament and, consequently, they would be more assertive in generating pressure on conducting inspections against countries

which would not abide by their non-proliferation agenda. This possibility would be subject to the limitations that none of the nuclear weapon states would place their nuclear forces under UN supervision. None of them except China would be willing to commit themselves to 'no first use' of their nuclear capacity. Most nations of the world would have signed the Comprehensive Test Ban Treaty and the Fissile Material Cut-off Treaty. There would be progressive pressure to eliminate the military missile systems and to prevent countries from missile development. Chemical and biological weapons would have been effectively banned. Some regional groupings, specially the NAFTA, NATO and the European Union, would become more influential and effective instrumentalities of the foreign policies of those countries.

Russia and China would not be entirely happy with the aforementioned scheme of things and may be looking for new strategic equations to counter the unidimensional influence of the United States on international affairs. The US response may be to contain China through equations with Russia and/or India, while China and Russia may be interested in a similar equation with India to counter the USA's strategic pre-eminence. If India remains united, becomes politically stable and economically and technologically strong, it could acquire a leverage in playing an important role in international relations.

What should be India's response to the aforementioned trends? First and foremost should be a focus on dealing with macro-level problems such as population control, environment management and economic development. Creating a strong Indian economy in the mainstream of international economic trends would lay the foundation for resisting intrusive international pressure or competition. India should acquire limited nuclear weapons and IRMB capacities to a level where regional or global powers would accept that generating pressure on India would not be worthwhile. The Indian army, air force and navy should be modernised, strengthened and endowed with sufficiently advanced weapons systems which would prevent military actions of the type which Iran and Iraq faced in the 1980s and 1990s. India should retain the freedom of option to adjust to external strategic threats and economic challenges detrimental to its interests.

India, therefore, would face a complex world in the 21st century in which it has to survive with just a little over 50 years of experience as a modern nation-state. This survival has to be ensured in the context of the abiding reality in international relations that gov-

ernments of great and influential powers command resources and military strengths that they use primarily to fulfill their perceived interests. As far as the international order consists of nation states, act in terms of who their institutional strengths, economic resources and technological capacities, foreign relations will remain a competitive phenomenon, occasionally prone to confrontations. India's foreign policy, therefore, has to predicate itself on *realpolitik* rather than on purely moral considerations or an idealistic world view, however desirable the latter may be.

Foreign policy experts have asserted that towards the end of the 20th century the future of foreign relations will depend on how countries and their leaders cope with five new imperatives in the international situation. First, a nuclear war is unthinkable. Second, everything must be done to dispel suspicion and nurture international trust and security, even when confronted with profound hostility or radical contradictions. This implies a willingness to maintain communications and nurture cooperation at every possible level, to the extent possible. Third, despite the requirements of adjusting to *realpolitik*, states should have sufficient faith in moral values to be convinced that they do not need war and military conflict to survive and flourish. Fourth, while deterrence or balance of terror provides temporary peace and stability, in fundamental terms, the arrangement is questionable. And fifth, the collective commitment to evolve an international mindset which will endeavour to create a fair and just world order should animate the foreign policies of all countries.

A principled and moral response to these unexceptional imperatives should be the overarching purpose of India's foreign policy in the 21st century, but it is not entirely possible. So in the interim phase, Indian foreign policy will have to deal with continuing contradictions between the amoral ground realities of world politics and the moral norms which we and the international community aim at. The endeavour would remain that of reconciling responses to the international situation, as it is likely to be, and the aspirations of what the situation should be in moral terms.

Cohesion and purposiveness in our foreign policy in dealing with this multidimensional dilemma would depend entirely on the creation of a national consensus based on enlightened public opinion responsive to our changing national interests in a continuously changing world.

J. N. DIXIT

# In search of a foreign policy

BHABANI SEN GUPTA

Prime Minister Atal Behari Vajpayee who also made himself minister for external affairs, initiated the search for a new foreign policy for India with five nuclear tests at Pokhran on 11 and 13 May, that is, within just about a month of his coming to power. The tests proclaimed India as a nuclear power and sought the world community's recognition of the country as one. It blew the long time consensus of keeping the nuclear option open but refraining from nuclear tests. The nuclear blasts, which came to be popularly known as Pokhran II, put in a tail-spin the entire praxis of India's foreign policy and foreign relations. As the decision was taken in a very narrow time frame of no more than a week, the tests were conducted without seeing through the immediate, medium and long term fallout.

The BJP as a political party had long been committed to make India a nuclear power. Its election manifesto promised nuclear tests if it were able

to form the government. The government that was formed in early March and headed by A.B. Vajpayee was, however, a coalition in which BJP was by far the leading member, but more than 86 short of a majority of its own in the Lok Sabha. The nuclear test issue was not discussed with the coalition partners. By its very nature, the decision had to be taken by a small number of people in total secrecy. It is doubtful if the Defence Minister, George Fernandes, was privy to the decision though he became an immediate and most vocal champion of the nuclear tests.

The foreign policy community in India, especially the strategic 'sub-community', had long asked for nuclear weapons in India's armoury. The people of India have never been educated on the unspeakably disastrous consequences of a nuclear bomb exploding anywhere on Indian territory. As a result, the urban Indian middle class entertained a romantic idea

of the majesty of nuclear weapons, almost echoing the American rhetoric that put a great halo around the Ultimate Weapon as the most convincing symbol of military and technological power in the post-Cold War world.

**T**here was little surprise therefore that Pokhran II was loudly welcomed by almost the entire middle class, especially the strategic community. Even political parties which, while in government, had refrained from nuclear testing readily joined the euphoric chorus hailing the May tests. Dissent came in the immediate wake of the nuclear tests only from the small but vocal minority that had long argued against nuclear testing by India. However, within a week of Pokhran II, the political divide about nuclearisation got back to the floor of the Lok Sabha. The Congress-I spokesmen accused the BJP and its allies of hyping India's threat perceptions and damaging the painfully constructed tepid friendship with China. Communist MPs blamed the government of starting a nuclear arms race in South Asia.

The nuclear tests upset the entire framework of Indian foreign policy and sponged out the long time consensus. The Indian tests inevitably brought about six reactive tests by Pakistan. The BJP leaders in the government, especially Home Minister Lal Krishna Advani, made certain provocative statements on Kashmir which were successfully calibrated to push the Pakistan Prime Minister, Mia Nawaz Sharif over the brink. In spite of earnest pleas by President Clinton, Pakistan carried out its own tests in the last days of May.

The Indian tests were justified by a deliberate enlargement of threat perceptions from Pakistan and China. Indeed, China was the villain of the threat scenario fabricated by George

Fernandes and the BJP leaders of the government. It was the Chinese tests of 1964 that had triggered the demand for an Indian nuclear bomb by a steadily expanding group in the foreign policy and strategic community. The Chinese tests persuaded Indira Gandhi to adopt the Sarabhai plan for long term nuclear research with a distinct bias for possible weaponisation. The Pokhran test of 1974 proclaimed to the world India's technological capability to make nuclear weapons. The test was described as 'peaceful'.

**T**he official pronouncement said that nuclear blasts would make it easier for India to build large dams and to explore mountainous terrain for possible deposits of precious minerals. Gradually, India acquired the technological expertise to build its own reactors which were placed outside international inspection. More than 30,000 scientists and engineers were employed on an increasingly ambitious nuclear research programme. Leading nuclear scientists like Vikram Sarabhai, M.G.K. Menon, Raja Ramanna and, particularly, the present chief scientific adviser in the defence ministry, Abdul Kalam fueled the appetite for an Indian nuclear arsenal. India's exploits in the sophisticated realm of space and missiles acted as stimulants for nuclearisation.

International, especially American, experts and agencies probing probable candidates for nuclear proliferation began to speculate in the eighties about the state of India's nuclear aspirations and capabilities. It was assumed that India had assembled a modest basket of experimental nuclear devices. Pakistan too was not sitting idle. With technical assistance from China and desperate procurement of technology and material from different sources, including Ameri-

can, by means fair and foul, Pakistan too acquired a certain amount of bomb-making capability in the eighties. Indian and Pakistani military leaders projected the view almost simultaneously at the turn of the decade of the nineties that nuclear capability in both countries acted as a deterrent. This deterrent prevented a war between India and Pakistan even when a widespread armed anti-Indian insurgency exploded in the valley of Kashmir in the early years of the present decade.

Covert nuclearisation by India and Pakistan created anxieties in the United States which is the prime creator and defender of the prevailing international nuclear power regime. The Americans put a lot of pressure on Prime Minister I.K. Gujral to sign the Comprehensive Test Ban Treaty (CTBT). The treaty contained an 'entry into force' clause which required the signature of India and Pakistan for the document to come into force. This clause was inserted without consulting India.

**A**part from that, the CTBT confirmed the differentiation of the international community between the five established nuclear powers and the rest of the world which was to remain committed to non-proliferation. It contained no commitment by the nuclear powers to rid the planet of nuclear weapons even within a very long time-frame. Mainly for these reasons India did not sign CTBT. Gujral at one stage offered India's signature to the treaty if the five nuclear powers agreed jointly or unilaterally not to strike any non-nuclear state with nuclear weapons. Among the nuclear five, China alone had made a no strike commitment with regard to non-nuclear countries. The Indian proposal did not receive a positive response from the nuclear powers.

When the BJP coalition government conducted five nuclear tests in May, one of them thermo-nuclear, and Pakistan followed suit with six tests, they automatically invited comprehensive economic sanctions by the United States. Five industrial countries—Canada, Japan, Germany, Sweden and Australia—joined the American sanctions. Relations between India and the United States had gone through ups and downs through the decades of Indian independence. However, the United States was India's principal trade partner and a fairly large and diverse area of mutual cooperation came to be built in the eighties and nineties including low level strategic cooperation. The relationship came to a halt as a result of Pokhran II. Investment flows from the US dried up except what was already in the pipeline.

**T**he Japanese sanctions were limited to Official Direct Aid (ODA) of which India was the largest recipient. Unofficial investment flows did not come under the sanction regime. But corporate Japan followed the Americans and stopped new investments. So did Germany, Australia and Sweden. Britain did not join the sanctions, but British investments also stopped coming into India. A high level Indian trade delegation visited London in the summer only to draw a blank in commitments from the British business community.

Until October 1998, foreign investment in India was a little over one third of the investment flows of the corresponding period in 1997. The Times of India on 12 October reported that industrial growth dipped to 3.6% in the first half of 1998-99 from 6% in the corresponding period the previous year. Although Finance Minister Yashwant Sinha assured in August that the economy would begin

to look up from September, a climate of gloom set in as the year proceeded to its end, and competent bodies forecast a 5% GDP growth in 1998 compared to almost 7% in the three previous years.

**T**he government, however, took a number of measures to augment hard currency inflows and give a boost to the economy. The Resurgent India Bonds floated by the State Bank of India netted a handsome \$5 billion though an undisclosed part of it was transfer of money from other accounts to the Bonds by Indians. NRIs failed to rally to the country's rescue from the sanctions. The BJP coalition government faced an economic slowdown that was showing signs of a recession at the end of the year. The government drew up plans to further liberate the domestic economy from government regulations and control, to cautiously increase the pace of privatisation of public sector companies, and to engage some of the captains of the private sector in the task of revitalising the economy. However, prices of essential commodities kept rising fearfully beyond the lean purses of the mass of people. Exports declined. In less than a year, the foreign exchange reserves diminished by some \$4 billion. The BJP's flag of swadeshi or self-reliance flew only at half mast.

The BJP leadership engaged first in repairing the relationship with the United States. The prime minister found in Jaswant Singh, deputy chairman of the Planning Commission, a sober, moderate, pragmatist special envoy for a long, complex and difficult dialogue with the US government represented by the Deputy Secretary of State, Strobe Talbott. Even after six rounds of secret talks the dialogue was in a tunnel. The two sides were evidently trying to sort out such complex issues as weaponisation, deploy-

ment, restraint of production and deployment of medium-to-long range missiles, India's participation in negotiations on a fissile material control treaty and commitment to sign the treaty as it came out of the negotiations, and inspection and verification of India's nuclear commitments. Prime Minister Vajpayee, on his part, declared that India would not undertake any more tests, would be willing to formalise the unilateral moratorium by signing the CTBT before September 1999 with some unspecified modifications, and that India would confine itself to building a minimum nuclear deterrent which would be defensive in nature. However, he did not define a defensive minimum deterrent, while a segment of BJP-oriented strategic analysts forcefully argued for an open-ended deterrent.

**L**ack of satisfactory progress in the Indo-US diplomatic bargaining on the nuclear issue led to the postponement of President Clinton's visit to India (and Pakistan) in 1998. Nor was Vajpayee invited to visit Washington. In October, the White House decided to relax the sanctions on Pakistan in order to pump enough oxygen to its seriously sick economy and bail it out from default on debt servicing. Prime Minister Nawaz Sharif was going to Washington in December presumably to commit Pakistan's adherence to CTBT as well as meet some of the other US non-proliferation demands. Prime Minister Vajpayee betrayed a deep faultline in the BJP's proud slogan of swadeshi by criticising Clinton for being 'partial' to Pakistan. He chose to recognise that Pakistan's economy was in a far worse shape than India's so much so that The Economist in a leading article on 17 October, described Pakistan's economy as 'crumbling'.

After the nuclear tests, India's relations with China came to an ominous

standstill. Beijing took serious objection to leaders of the BJP coalition, especially Defence Minister George Fernandes, describing China as India's enemy number one and hyping India's threat perceptions of its nuclear power neighbour. Indeed, Indians had been citing China's nuclear arsenal as a real threat to its security ever since the late '60s, and the tests of May 1998 were justified mainly on the continued nuclear threat from the East.

**B**y reviving the enemy image of China, the Vajpayee government invited a pale cast of frost on the considerable improvement in India-China relations achieved by more than 15 years of painstaking diplomatic engagements by the two countries. As a result of these engagements, the Sino-Indian border remained tranquil for a full decade, a mosaic of confidence building measures had worked well on the north-eastern sector of the border, border trade had crossed a billion dollars per year, and India was able to withdraw most of the troops from the north eastern sector and deploy them on the western front. The joint border commission had six sessions. Though no progress was made in resolving the dispute, the fact that the dialogue was continuing ensured that the border would remain peaceful.

The Chinese government quite clearly did not enjoy India and Pakistan going nuclear. It had helped Pakistan develop its nuclear weapons programme at least till 1993 when it promised the visiting Indian Prime Minister, Narasimha Rao, that it would stop any dealings with Pakistan in nuclear related technologies. China claimed that it was strictly observing that commitment though the CIA and several other official and unofficial agencies in the United

States continued to find ongoing nuclear dealings between Beijing and Islamabad. The BJP government chose to lend greater credibility to these US disclosures which were echoed and repeated by pro-Bomb Indian strategic writers and think tanks than on official Chinese disclaimers of these accusations. After the South Asian nuclear tests of May 1998, China raised several other issues that it said had strained relations with India. It accused India of indulging the Dalai Lama in his political activities within India and in the western world, and took serious objection to Fernandes' rhetoric about 'liberating' Tibet from China's 'imperialist control'.

**D**uring a visit to Pakistan in October-November 1998, this writer found that China had done nothing to succour its 'traditional friend' since the tests of May. It had turned down a Pakistani request for nuclear protection. It did not offer Pakistan any financial help to tide over its foreign exchange crisis. It did not build up any pressure on the border with India, nor disturb the decade-long border tranquility. China kept up its pressure on Pakistan to sign the CTBT without conditions. It did not change its stance on Kashmir. There was no support from China on the 'right of the Kashmiri people to self-determination.' Beijing held on to its new policy that Kashmir is a bilateral issue between Pakistan and India and should be resolved between the two through peaceful means. It condemned Osama Bin Laden's terrorist activities from the soil of Afghanistan. China, in fact, remained as wary of the Islamic extremism of Taliban in Afghanistan as did India and many other countries.

The only satisfaction China gave Pakistan—it may be described as a consolation prize—was that it almost froze relations with India. In doing so,

however, China betrayed its fear of a nuclear India. Indeed, a nuclear India changed China's security scenario more patently than India's. Indians often expressed a feeling of being 'surrounded' by nuclear China and Pakistan as a fledgling nuclear power, with American nuclear might visibly stationed on land and under water in the Indian Ocean, the Mediterranean Sea and the Persian Gulf. China had now to contend with the menacing nuclear might of the United States with its commitment to the security of Japan, and its readiness to intervene in the event of a Chinese attempt to take Taiwan by force, and a nuclear India with the capability of growing into a credible nuclear power. The Chinese government must therefore be closely watching the diplomatic dialogue between the United States and India, and they are unlikely to return to the process of improving relations with India until New Delhi signs the CTBT.

**O**fficials of the Indian external affairs ministry expended a great deal of time, energy and resource explaining to neighbours and neighbours' neighbours, as well as leading members of the Non Aligned Movement, the imperatives of India going nuclear and assuring them that a nuclear India did not pose a threat to any one of them. ASEAN, with which India's economic and even strategic relations blossomed in 1996-98, especially during the rule of the United Front government, was critical of nuclear weaponisation of South Asia at the post-summit dialogue in Manila and at ASEAN meetings held there shortly after the explosions of May 1998.

At the SAARC summit in Colombo, South Asian leaders other than from Pakistan articulated their security concerns in one-to-one talks with Vajpayee though the issue did not come up for formal discussion at the

regional forum whose constitution keeps security matters outside its agenda. At the Non Aligned summit in Durban, the new chairman of the Movement, Nelson Mandela, the only charismatic leader left in the Third World, listed Kashmir as one of the major flashpoints in the world and caused the Indian delegation led by Vajpayee much embarrassment and anger. So much so that Vajpayee himself had to join issue with Mandela, while his aides sweated to keep Kashmir and nuclearisation of India and Pakistan out of the declaration issued at the end of the summit.

Indian diplomats patted themselves on the back for their success in keeping Kashmir and the tests of May out of the official communiques or declarations issued after the important events like the NAM and SAARC summits and the ASEAN's annual dialogue. However, they could not convince nations with close interactions with India that the nuclear tests made no difference in world politics and that it was business as usual between India and the rest of the world.

It was not business as usual. After the Asian currency turmoil and the political changes that shook Indonesia, Thailand and the Philippines, came the serious recession in Japan, which was followed by a global economic slowdown taking on unmistakable aspects of a global recession. The Asian 'flu' infected Wall Street manifesting tell-tale evidence of how the global economy had qualitatively changed in the last quarter of the 20th century. Only the economies of China and India remained relatively secure thanks to their comparative isolation from the global market and the process of globalisation. Both avoided official devaluation, but both were more than inching towards it. Both faced an economic downturn, but China's

8% and India's 5-5.5% growth compared very favourably with the dismal growth rate of the once-hailed tigers and dragons.

The bleak Asian economic landscape and the looming global recession would have greatly enhanced the attractiveness of the vast, reasonably stable and cautiously opaque Indian market which starved for vast investments in infrastructure, telecommunication, information industry as well as a broadly pre-modern agriculture. The nuclear tests of May cost India a mass of opportunities. Even an undefined minimum nuclear deterrent meant enhanced defence spending particularly because political factors, bureaucratic inertia, and shortage of jobs made cutting the fat off the huge 1.2 billion strong standing armed force to a slim-and-trim, modern, streamlined, far more efficient force impossible. Back-of-the-envelope calculations of the cost of the Indian *force de frappe* varied from Rs 500 crore to Rs 40,000 crore a year. The government was in no hurry to come out with its own estimate, nor with a nuclear doctrine beyond the ambiguous statement of 'a minimum credible deterrent.'

The only silver lining in the otherwise bleak horizon of India's post-Pokhran II foreign policy was the opening of a comprehensive dialogue with Pakistan in the fall of 1998. The concept of the two countries engaging in a comprehensive security cum development dialogue was incorporated in an agreement reached between Nawaz Sharif and I.K. Gujral, Vajpayee's immediate predecessor belonging to the United Front, in June 1996. But the talks froze before they started because of Pakistan's insistence that Kashmir be exclusively discussed between the two foreign secretaries as it was the 'core issue', and India's refusal to concede the demand.

The ice broke at the SAARC and NAM summits partly under not-so-hidden American pressure on both countries, more on Pakistan than on India. In November 1998 the foreign secretaries met to talk Kashmir, and in quick succession several other meetings at the level of secretaries took up other security issues as well as trade and cultural exchanges. At most of these first encounters, after a long interval, the two sides, predictably, read familiar scripts, but decided to keep the dialogue going despite the initial lack of progress. On trade and cultural exchanges, however, some progress was made creating prospects of commercial channels opening up by land and sea, with Pakistan, finally, agreeing to give India the most favoured nation status. The neighbours between whom exist large areas of mutually beneficial trade and commerce woke up at last to their obligations under the upcoming South Asian Preferential Trade Agreement (SAPTA).

In other areas, Indian foreign policy waited for the powers and nations to accept India with its nuclear tests if not as a nuclear power, at any rate as a power armed with nuclear weapons and a delivery system. Diplomatic contacts with no single government broke down or got frozen. But the wheels of diplomacy moved but slowly. Fewer world leaders visited the Indian capital. Atal Behari Vajpayee in the first seven months of prime ministership visited only five capitals. His government did not inflict visible injuries on the Gujral Doctrine that dramatically changed India's relations with the smaller neighbours and adopted a deliberately designed strategy of going East to the Pacific in search of friends and flows of investment and commerce.

However, the lumpen elements of the Sangh Parivar (RSS, BJP, Shiv

Sena, Vishwa Hindu Parishad, Bajrang Dal and other front bodies) drove batches of 20-25 Bangladeshi illegal migrants and pushed them across the border into Bangladesh with the help of the Border Security Force (BSF) and put the otherwise excellent relations with Dhaka to needless strain. The BJP leaders showed little sensitivity about the fundamentalist pressures on the Prime Minister of Bangladesh, Sheikh Hasina Wazed, from the extreme Islamic Taliban in Afghanistan and its raucous supporters in Pakistan as well as Bangladesh.

Since the nuclear tests of May, the Indian mass media sought to downplay the importance of foreign policy and external relations and got engaged with security, especially nuclear arms. Unfortunately, India was 20 years late with its nuclear tests. It indulged in history's longest debate on whether to go nuclear, and when it finally determined to cross the Rubicon, the global trend was against nuclear weapons and towards their abolition or drastic reduction.

To be sure, the arsenals of the two major nuclear powers, the United States and Russia, alone were enough to wipe out human civilisation several times over, and France and China had not even joined the process of reducing their nuclear armour. Nor did nuclear weapons go out of the military doctrines and rhetoric of the nuclear five. However, with the CTBT gaining the status of a global treaty, and negotiations about to begin for a Fissile Material Cut-off Treaty, global trends and processes were clearly and conclusively towards a world less, and not more, under the active thrall of the Ultimate Weapon. Indian and Pakistani tests underlined the fragility of the non-proliferation regime and impressed on the nuclear powers the imperative of pacing up the slow-moving process of nuclear disarmament.

# Politics in the Russian Federation

HARI VASUDEVAN

IT is a telling fact of discussion in India of Russia's South Asia policy that seven years after Soviet disintegration, prominent figures compulsively speak of 'Indo-Russian friendship'. *Druzhba* remains an obsession among commentators, despite the recasting of Central Eurasia in 1991, and the clear reorientation of Moscow's foreign policy priorities during Andrei Kozyrev's stewardship of the Russian Ministry of External Affairs.

This persistence in perspective partly follows from a 'new course' in Russian foreign policy under Evgenii Primakov: a course designed to correct the western tilt of the early '90s. It is also a consequence of the constant use by lobbies in New Delhi and Russia of *druzhba* as a touchstone irrespective of regimes: their remarkable achievement in keeping the rhetoric of amity alive in the bureaucracy and the media. In the Russian Federation, India's 'special relationship' with the country is privileged almost as much as the historic connection with Serbia, and it is regarded as less problematic than close connections with Iran, Iraq and China. In India, despite overtures towards the USA and Europe, the Russian link remains important in South Block and among the armed forces.

'Friendship' remains alive, though, for reasons more substantial than ministerial preference, rhetoric and lobbying. It is the result of the circumstances that Russia and India have lived with since the end of the Cold War, especially the limited benefits accruing to them from liberaliza-

tion and globalization. Here, proper adjustments of economic relations between India and Russia during the Burbulis visit of 1992 and the Yeltsin visit of 1993 have provided markets and resources to both countries without incurring pressures on unsteady currencies. The advantages have been important to a crucial sector: the badly beaten military-industrial complex in Russia and the defence establishment in India, which has faced demands for cutbacks.

**T**he consequence must be, in the immediate future, that, whatever the problems raised by the nuclearization of South Asia, Moscow will stand by its old ally in a range of international disputes and incidents. Uncertainty hovers over the terms of the support, for there will be no unconditional underwriting in Moscow of Delhi's views on missile technology transfer or nuclear proliferation. A sympathetic ear, though, and a range of material support will always be forthcoming.

Most of this is self-evident in Smolenskaia Ploshchad and South Block. It is the standard currency of mutual understanding between Russia and India. But what is increasingly important are the terms of the relationship: i.e. the why and where of support. For the position today is not comparable to the two decades following 1971. Indo-Russian friendship, moreover, lacks an ethnic or linguistic association (which exists in the case of Russia's relations with Serbia, for instance). It is not based on religious connections (i.e. Orthodoxy), or a century of discourse concerning 'fraternity'. It is not fundamentally historical, reinforced over time and verging on the elemental, whatever the attempts by Indian and Russian historians to show a centuries-old search for closeness.

Here, the uncertain ambit within which 'friendship' existed was evident following the events at Pokhran on 11 May. 'Positive' signs were quickly advertised by the government in New Delhi. Russia consistently refused to frame sanctions against India for her 'breach of nuclear ethics'. Although Boris Yeltsin expressed his displeasure concerning the Indian action and he firmly stood by the terms of the NPT and the CTBT, he never went beyond this.

It was evident in Moscow, as it was in India, that Vajpayee had followed an unfortunate and dangerous course in making this country nuclear. But the anomalies of the world's nuclear regime and India's respect for the ground rules of international conduct were also evident. Hence, Yeltsin's criticisms were muted, and the significance of his posture was reinforced by laudatory remarks by senior Russian military officials concerning the Indian action and congratulations by parliamentary leaders Gennadi Ziuganov from the Communists and Zhirinovskii from the Liberal Democrats.

**A**mong some commentators, Yeltsin's failure to support US policy on India was put down to domestic compulsions to appear self-assertive in the face of communist criticism concerning 'tailism' in dealings with the West; echoes of Euro-American condemnation of the blast, meanwhile, were regarded as a necessity to Russia as a signatory to the international non-proliferation regime. There was clearly more to the president's stand. Like France, the USSR, the Russian Federation's nuclear predecessor, was never, in spirit, in accord with NATO definitions of non-proliferation.

It avoided a non-proliferation treaty for almost two decades after the explosion of the atom bomb. And dur-

ing SALT talks, it was singularly secretive about all aspects of its strategic rocket programme and the related research which constituted the hub of the Soviet Union's nuclear arsenal. Arkady Shevchenko, a leading figure in Soviet peace planning, when Andrei Gromyko was external affairs minister, firmly stated in his memoirs that the USSR was seldom serious in its arms limitation dealings. This spirit carried on to the Russian military establishment which is powerful in Yeltsin's entourage.

**S**ince 1995, moreover, after a period of 'tailing' the USA on almost all international issues, Russia charted an independent foreign policy course under External Affairs Minister Yevgenii Primakov. This change was partly the upshot of Russia's inheritance of the Soviet nuclear stockpile, and her annoyance with US restrictions on her capacity to use the formidable nuclear expertise to help resolve her economic problems. It was not only the great dinosaur of the Russian military-goods establishment – *Rossvoruzhenie* – but also a number of plants strung out from St. Petersburg to Novosibirsk that wished to sell nuclear-related technology, and they constituted a lobby for going soft on minor transgressions of the international non-proliferation regime. For them, the G8 declaration and the confusion among Euro-American commercial interests over India investments was useful: it kept open avenues for business. China had been a good customer, and Europe had not been far behind. India appeared promising.

Despite all this, though, the ambivalent position that the Russian Federation had to take on nuclear issues was evident to observers. Various interests which made a pro-India tilt uncertain were essential elements of

the 'new Russian' foreign policy. Russian policy-makers had come to swing firmly towards Iran in their predilections. In this case, despite the Shia-Sunni antagonisms that divided Iran from Pakistan, and their disagreements over Afghan affairs, Iran was not wholly hostile to Pakistani interests. She saw in a Pakistani nuclearity, and an 'Islamic bomb', the future of her own acquisition of nuclear hardware; and she was clearly keen to maintain good relations with Islamabad.

Yevgenii Primakov, in turn, as Russia's foreign minister, had been clear that Iran was crucial to Russia's interests in Central Asia and the Caspian neighbourhood. President Karimov of Uzbekistan had proved an unreliable safeguard for these interests, and Primakov had come to look to friendship with Iran as a source of assistance in the scrimmage over the oil and gas of the Caspian shelf. The USA, here motivated by a range of oil interests, had refused to accept Russia's dominance in the area, even though it had accepted Russia's rights to police Central Asian borders in 1997.

**I**ran's coincidence of interests with Russia, meanwhile, had been self-evident. Russia provided Iran's expanding ports on the Caspian (e.g. Engeli) with a vast traffic, especially from Astrakhan. Russia also provided great business for Iran's fleet in the area. In return, in defiance of US arguments, Russia had agreed on transfer on nuclear know-how to Iran. In the circumstances, Primakov would have clearly been reluctant to irritate his West Asian ally who was unlikely to favour actions fundamentally hostile to Pakistan.

28 A further factor which placed limits on a pro-India policy in Moscow at this time was the firm China hand that had been played at

Smolenskaia Ploshchad: a stand which would have to take note of China's alarm at India's nuclear status. China trade supplied Russia with an increasing trade surplus and an excellent market for arms – submarines, C-300 solid fuel anti-aircraft missiles, missile guidance systems and SU-27 fighters. After the USA and Europe, China was a favoured market in Russia.

**F**inally, recent vicissitudes notwithstanding, the social politics of the Russian ruling elite did not direct government towards a rapprochement with India to the detriment of other sources of investment and aid in the West, and especially the US. This was revealed in the crisis which brought Prime Minister Kirenko to power in early May, which demonstrated the authority of the westernizers in Moscow until very recently. The crisis was deliberately brought on to ensure that in the event of Boris Yeltsin's death, Viktor Chernomyrdin, who was closely associated with the old managerial elite of the Soviet state, would not succeed to the presidency.

The conspirators here were Anatolii Chubais and Boris Nemtsov, who were Kirenko's masters. The former was the lead figure behind privatization and the darling of the West, while the latter was the former Nizhniy governor who gained great status as a supporter of privatization. Both understood that Chernomyrdin's authority lay in his links with the genus of state corporation conglomerates that have emerged from the Russian reforms ('holding companies', 'concerns', 'financial investment groups' etc.). These were agencies which were privatized but which had close links to government and were rarely dependent on western aid. They were not 'communist' in political leaning, but they had no great affection for Washington.

In the circumstances, Chernomyrdin's presidency would have been a victory against the full-fledged privateers – those who depend on foreign investments, quick money and speculative trading. It had to be avoided, and the capacity of the Chubais group to prevent it demonstrated its authority in Russian affairs. This may have been the consequence of support from US funds, which was publicly despised, and the work of millionaires and media moghuls such as Berezovskii and Gusinskii who were singularly unpopular. But the power of 'westernizers' had a decisive quality. Gubernatorial mandarins from Sakha to Kaliningrad depended on them for crucial services with private banks and foreign investors. Agricultural associations and trade unions could exercise no restraint on the privates. Boris Yeltsin's 'court', as well as his electoral campaigns, have been wholly dependent upon them.

**T**he appointment of Evgenii Maksimovich Primakov as Russian prime minister in September has hardly changed these circumstances. True, Primakov is an India hand of sorts and a quiet protagonist of good relations with the USSR's old allies. His appointment as foreign minister in 1996 marked a determined break from Andrei Kozyrev's pro-West policies of the preceding three years, and an assertion of a 'Russia first' syndrome at the Ministry of External Affairs at Smolenskaia Ploshchad. Primakov was also the architect of the resurgence of Russia's interests in Iraq and Iran, which, along with Egypt and Syria, he knew very well. He has been looked on with a degree of suspicion in the West. In many respects, consequently, the new prime minister's appointment appeared to signal a further step in the possible remaking of the pre-1992 establishment in Russian politics.

With this some have come to anticipate a powerful Russian presence in global affairs, with off-beat views on economic organization and international regimes, capable of withstanding US hegemony. The emergence of communist authority in Russia is regarded as the pivot of such a 'renaissance', and Primakov's appointment is occasionally regarded as a major step towards such a development. Hereafter, runs one argument, only the presidency remains as a possible bastion for the revolutionaries of 1991 – those intent on changing Russia's Soviet priorities. It does not matter that Primakov was a Gorbachev man who has got on with Boris Yeltsin. Many have come to regard him as the weak prime minister who will act as a cat's paw for the left alliance in Russian politics. They feel he may be the means whereby the success of Gennadii Ziuganov, head of the Communist Party of the Russian Federation (CPRF), may be ensured in the presidential elections of 2000. Or he may act as a pro-tem pro-left president before that, should Boris Yeltsin become incapacitated.

**T**he grounds for reading Primakov's appointment in these terms are clear. They go well beyond his own record as a Brezhnev loyalist and a KGB fellow traveller while he was a Pravda correspondent. His appointment came, with unanimous communist support, at the end of a steady consolidation of the political hold of the CPRF on Russian institutions. Thereafter, he has chosen to show his preferences by making a known statist, Maslyukov, his finance minister. This has occurred at a national level while the communists have a leading role in the Patriotic Front which dominates the lower House (Duma) of 450 deputies. Here, the CPRF had 149 deputies and, within the front, they work with a 'left alli-

ance' of the People's Power Group (37) and the Agrarian Party (35). With Zhirinovskii's Right (51), they have made a dominant 'nationalist' front.

**T**he opposition to them has been divided and scattered: Chernomyrdin's Our Home is Russia (55), the liberals of the Yabloko bloc (48), the Russian regions' group (42) and various independents (33). Elsewhere, a large number of the governors represented in the parliamentary Upper House (Federation Council) have been elected with communist support, and the CPRF has a strong hand in local government bodies. Communist strength is so great that there were negotiations with the president about power-sharing earlier this year (which raised alarm among communist allies).

Primakov's position, if his sympathies are read right, may be seen to give communists access, in the future, to appointments in major state corporations and an inside role in the ministries, where control had eluded them so far. They would seek little else for fear of acquiring the stigma of the regime's economic failures. The prime minister has not been expected to stand against them, even if he has stated that he will not be guided by any single party. This, some have argued, was why the CPRF did not ask for diminution of presidential authority when they accepted Primakov's nomination for prime minister. Viktor Chernomyrdin, whom the communists rejected, was a different public figure altogether. Although he was a 'red manager', i.e. a technocrat with ancient regime credentials, he had charted his own course and established a formidable base in Russian politics.

By January 1998, Chernomyrdin was the most powerful man in Russia after the Russian president.

Prime minister for five and a half years, he had a better knowledge of the country's administration and politics than anyone else. He had informal control of a large parliamentary grouping (the Our Home is Russia Party). In January this year, he came to establish a major hold over the energy complex, military finance and the military goods monopoly (Rossvooruzhenie). The latter was important given its international and national influence; and Chernomyrdin filled a vacuum created by the dismissal of presidential functionary Alexander Korzhakov, who controlled the organization from the government end, and the resignation of Korzhakov's men in the presidential apparatus. Chernomyrdin's main weakness (which brought him down in March this year) was his alienation of the coterie around Yeltsin: the westernizers Boris Nemtsov (an influential deputy prime minister), and Anatolii Chubais (the head of privatization), Yeltsin's daughter, Tatiana D'iachenko, and the president's chief of staff, Valentin Iumashev.

**H**owever, there are many ragged edges to such a reading of Primakov's appointment – 'edges' which have clear foreign policy implications. Extremely important is that the powers of the presidency over the cabinet and key ministerial appointments have been left almost untouched during the September crisis. The assumption clearly was that Yeltsin would be too unwell or politically weak to make substantial use of such powers. But the circumstances left open the possibility of his reassertion of authority. Should Yeltsin recover from his recent ill health, consequently, he has the capacity to use his 'rights' to serious effect – perhaps to bestow some favour on the communists' favorite whipping boy, Anatolii Chubais. Yeltsin has

clearly shown in this last crisis that he values his powers. It was clearly for the sake of these that he finally abandoned Viktor Chernomyrdin, despite his knowledge that he would make the best prime minister in existing circumstances. To gain support for Chernomyrdin in the Duma, however, would have meant concessions which would have paralysed Yeltsin and his coterie.

**I**n the circumstances of a recovery, Yeltsin may use important advantages to gain the upper hand in the country's policy-making in the near future. The CPRF and most Russian political parties are strongly divided on ideological and programme grounds. Among the communists, for instance, Tatiana Astrakhankina represents a 'traditional' line against the national communism of Gennadii Ziuganov. Parties also lack powerful institutions for public mobilization to counter presidential action. The CPRF, which was born out of the CPSU, never had any, except the official trade unions of the old order. Not only are the latter – represented by the FNPR body – weak (except in the case of the miners' organizations) because of their history of bureaucratization, but they lack clout given the current state of the economy. Off-beat, liberal-inclined unions (represented by Sotsprof) have little credibility because of their association with the establishment. The networks, meanwhile, which underpinned the 'movements' of 1989-92 (affiliated to the Democratic Union and the *Demokräticheskaiia Rossiia* movement) have almost all collapsed in recent times: so communist allies are as weak as communists themselves.

With the strategic moment of the September crisis gone, therefore, it is unlikely that the communists can bring pressure to bear on President

Yeltsin before the elections of 2000. Again, as Federation Council support for Chernomyrdin's candidacy in the second round of voting in September indicated, there is no certainty that the communists can enforce their authority on provincial executives on a regular basis. Governors and the republican presidents of Tataristan and Bashkortostan are capable of playing with international investment funds and ethnopolitics to give themselves leverage in the case of a national emergency.

Other means that the president will use to preserve his authority include his hold over foreign investment agencies and major sectors of the economy (such as oil and natural gas). These advantages ensure the limited loyalty of powerful governors such as Guzhvin of Astrakhan (where the Caspian oil business is crucial), and functionaries such as Alexander Permiukov in the Khanty-Mansiiskii region (another centre of the gas and oil business). The difficulties of finding money for the economy without Yeltsin's blessing have already been shown in Volgograd, where the communists are assertively in power. Budget-wise, the region is in the black, but the administration finds investment with great difficulty.

**A**re-emergence of Yeltsin's authority will undoubtedly have important foreign policy implications in such circumstances. For India, there may be little cause for concern given the great hold of the defence establishment at Yeltsin's court and the favour which India enjoys within the presidential apparatus. The Russian president, however, is a maverick figure in Russian politics. He has many associations and connections with the West which have proved a major problem to Indian defence and foreign policy interests in the past. In the even-

tuality of his renewed ascendancy, the functionaries who surround him would have to be observed with care.

**T**his is all the more true since the Russian economy still lives in hope of western assistance, and the westernizers will be crucial in brokering any arrangements. The current economic crisis is clearly the result of poor reserves (c.\$17 billion) and government issue of credit paper (GKO's) to the tune of some \$70 billion to keep a number of sectoral and public banks in work. Meanwhile, revenue levels are poor and Moscow is playing with high levels of debt to the West (primarily Germany). The only alternative to western assistance, as a 'solution' of sorts to the crisis, is an inflationary spiral which would be unwelcome.

Ill health and the demoralizing consequences of his economic reforms, of course, will always be major problems for Yeltsin. Equally important, the apparatus which must use his advantages has been severely crippled by the praetorian regime of his head of security, Kozhakov, who was dismissed some two years ago. The adhocism and terror of this time bruised the institutions that Yeltsin's former chief of staff, Sergei Filatov, attempted to piece together. Some 'repairs' are now being slowly undertaken by Yeltsin aide Valentin Iumashev, but he has found his task difficult. There is also the danger of rampant bouts of popular violence, which the president also has to fear.

In the circumstances, however great the strengths of India-Russia *druzhba* today, the character of Russian politics itself requires caution for any detailed prognosis of the immediate future. Undoubtedly to forecast the restoration of all but the semblance of things past appears somewhat premature.

# A cosy relationship

ANURADHA M. CHENYO

INDIA and Russia have both made paradigmatic shifts in their foreign policies and worldviews in the 1990s. Russia, charting its course as a new nation in transition to capitalism, made a systemic and epistemological break with its past. It rejected theories of imperialism, shunned contradictions with the West and shed beliefs on natural alliance with the Third World. The new and pragmatic foreign policy regime of Russia decided to accept realism as its creed and locate itself as a 'normal' state within the European Union, with similar aspirations both for its people and state.

Simultaneously, India felt trapped in a fast globalising world. The mandarins of South Block were called to rethink reality and realism. They now perceived that their allies among the non-aligned were either sinking into a debt trap or were forging ahead as 'local tigers' with their own set of regional alliances. India was, moreover, bereft of an ally in the Soviet Union. The old problems on her borders remained unsolved. The decision by the mandarins was then to shed the tried and trusted foreign policy ideals and push for integration with the globalization phenomenon.

This globalization phenomenon translated into foreign policy meant a simple reassertion of national interest

by cozying up to the remaining super power and establishing superiority within the South Asian region. The BJP government, who saw this as an appropriate moment to realize their ambition of a hegemonic India, made a real break with the past. Once in power, they created an atmosphere of fear and aggression *vis-à-vis* Pakistan and China and went ahead with the nuclear tests in Pokhran in May 1998.

How did Indo-Russian relations fit this mould of new thinking? Did the aspirations of the two foreign policy regimes match with the reality that they understood? How could Russia withstand pressures from the USA on defence deals with India? These are some of the issues this paper seeks to address.

The comfortable groove of Indo-Soviet friendship and decades of bilateralism had to be re-worked after the Soviet collapse. Would the new Russian state hold to its views on South Asia, given its new proximity to the West and especially to the USA? The foreign policy document brought out by the Yeltsin regime as a marker for its early years emphasized Russia's relations with the USA and the European Union. Though the Yeltsin regime repeated its commitment to India and echoed India's concerns on Kashmir, it was not until President

Boris Yeltsin's visit in 1993, followed by meetings in 1994 and 1997, that India and Russia once again felt at ease in reworking their strategic relations.

**I**t was the reality of globalization which pushed India and Russia into a strategic and economic alliance. In Russia the neo-liberal economic policies which advocated a complete destruction of Soviet type institutions and market led growth, led to a complete collapse of the Russian financial and economic system. Foreign aid and investment was far below expectation and was completely tied to import of western goods. The trade balance between Russia and the West was skewed against Russian goods. The secure COMECON trading bloc was over.

In these circumstances Russia once again had to look for its old allies – in India, the Middle East and South East Asia. Russia then made a second shift in its strategic thinking. While ideological proximity and alliance with the West was to be given emphasis (not necessarily priority), Russia's foreign policy aims were to be realized in the CIS 'near abroad' and with old allies in the Middle East and Asia. Bringing in Yevgeny Primakov as foreign minister in 1996 concretized this shift.

Independent Russia expressed the goal of inheriting the strategic space of the former Soviet Union in the post-Cold War environment. This meant that Russia would have to exercise through multiple ways a leverage over the rest of the Commonwealth of Independent States, especially the Central Asian Republics (CARs), strengthen relations with China and South East Asia, increase its negotiating capacity with the European Union and maintain an alliance with the USA.

Reality, however, ordained otherwise. Ever since the establishment

of independent Russia, its interests in Europe, the Middle East and in Asia have clashed with those of the USA. The Russians were opposed to East Europe's inclusion into NATO; Russia opposed US policy in former Yugoslavia and backed Serb interests through the Bosnian crisis. On the question of Kosovo, the Russians have opposed NATO military positions. It continues to support the Iranian and Iraqi governments as far as possible. In South Asia, Russia continues to support India on the issue of Kashmir, is opposed to its internationalization and, in opposition to US pressure, continues to supply defence equipment and nuclear power technology to India.

**O**f course, Russian opposition to USA on all these issues does not display the severe contradictions and the military or ideological opposition of the Soviet times. The rhetoric is missing, but the opposition continues. This opposition is based on Russian national interest and traditional alliance structures with these states, which the Russians would like to continue with. While the form of Russian strategic policy has radically changed, its content has more continuity than they would like to admit.

On the question of Afghanistan, Russian opposition to the Taliban is based on its fear of the conflict and fundamentalist ideology spreading into Central Asia, especially bordering Tajikistan, which is guarded by Russian troops. Russian press and foreign policy literature has squarely blamed the US-Pakistan nexus for reinforcing the Taliban. In Central Asia, the Russians have clearly reasserted their economic and strategic relations through multiple bilateral and multilateral agreements. But in Central Asia and Azerbaijan, the Russians are in direct competition with US oil companies. The geo-politics of oil

bring the Russians into conflict with the West, especially as control over pipelines and new trade routes are being established.

**I**ndia has made efforts to build ties with the CARs, but has had to compete with Pakistan, Iran, Turkey, China and the West. Here, India has faced some disadvantages because of the establishment of the Economic Cooperation Organization (ECO) which links up the Islamic states of the Middle East and Pakistan with the CARs. It is clear that relations with the Central Asian states can be built along three lines: independent bilateral relations; multilateral relations with Iran and the CAR as was done in the case of the India-Iran-Turkmenistan gas pipeline agreement; and multilateral relations between Russia-India and Central Asia. Building links with the CARs through Russia implies an advantage for India because Russia continues to exercise strong leverage in the CARs. The Russian-CARs trade links have been re-established and Russia is a major player in the Central Asia region. Indian and Russian interests coincide in the CARs. It would thus give India a clear geo-strategic advantage to link up with Russia in this region.

Russia, along with the rest of the international community, was critical of the May 1998 Indian nuclear tests, stating that it had felt let down by India. The tests were in sharp contrast to the 1987 Moscow declaration signed by the then Indian Prime Minister Rajiv Gandhi. In this declaration both powers denounced the dangers posed by aggressive nationalism, separatism, religious extremism and terrorism. Both countries demanded a nuclear free world and opposed further nuclearization. On the Indian nuclear tests, there were differences in the Russian political spectrum because the Russian Communist Party

supported the tests. Overall, Russia retains its old position that India sign the CTBT and become a party to non-proliferation treaties. It, however, has opposed the economic sanctions imposed by the USA and has refused to impose sanctions itself.

Russia was one of the states which promised to support India for a seat on the Security Council and thus has demonstrated to the Indian foreign policy establishment its loyalty to Indian positions and an understanding of India's strategic aspirations. Though US strategic analysts do have threat perceptions about a possible Russia-China-India nexus, for the moment it would be in Russia's interest if India could become a power to counter China and hold its own vis-à-vis the USA in the future. Though the Russians see no threat from either China or the USA, the Russian-Indian strategic link seems inevitable. There is thus the belief that there exists a possibility of a 'strategic partnership' between the two.

**T**rade links between India and Russia had to be rebuilt from a position of disadvantage. The trade ties of the earlier Soviet era with India, based on the government sponsored rupee-rouble credit agreements, were of a structural nature. With the disintegration of the Soviet Union and the continuous collapse of the rouble, the situation changed drastically. Trade had to be conducted in hard currency through private and joint stock companies set up by the Russians. State trading was restricted to defence and some other items. Indian companies had to deal with a new Russian bureaucracy and the mafia, especially since trade had not stabilized in Russia. Indian goods had to compete with western and cheap South East Asian ones.

No wonder then, India's trade with Russia (in per cent shares) which

was 19.2 in 1980-81 fell to 3.3 in 1992-93, climbing up by 1.4 in 1994-95. The Russians initiated the practice of auctioning the rupees received as debt repayment and private companies continued to buy up these rupees. Both sides had disagreements on pegging an exchange value and felt cheated because of the old deals. Trade had to shift to hard currency. After the 1993 Yeltsin visit, subsequent meetings, especially the 1997 visit of Foreign Minister I.K. Gujral, led to agreements which framed guidelines to utilise the rupee debt being paid to Russia by India for the setting up of joint projects.

**I**n the past, Russia used this money for its imports from India under the trade agreements. But now an economic package to cover a vast area, including science and technology, financial and banking matters, transport, coal, oil, metallurgy, commerce and culture was included. The two sides had worked on some 85 projects under the earlier agreements on science and technology, including the development of a multi-purpose light aircraft, Sarasduet. These were revitalised.

Other ambiguities in Indo Russian trade deals like the five per cent reduction by New Delhi in the price of fertilizers (muriate of potash) imported from Russia were sorted out. One of the agreed measures, intended to facilitate trade flows, envisaged a consignment export scheme under which products needed by Russian importers (like tea and rice) would be stocked in Moscow warehouses. As a result, it would be possible to expedite supplies to them.

The Russian offer to set up a nuclear power plant in Tamil Nadu at Koodankulam in 1988 was opposed by the Americans and was thus stalled for five years. Though it was revived

in 1993, the details of the project are still being worked out. The NPP features two power units each with 1,000 mwt water-cooled and water moderated reactors. Environmentalists have opposed the construction of these plants on account of the radioactive waste they would generate and because in the West nuclear power is becoming obsolete. But the Indian and Russian government are keen to continue with this project.

India's connections with Moscow always had a strong military side. Under the new regime, Russia is keen to continue with defence contracts, the receipts from which are in hard currency. Thus, despite US pressure on the Russians to stop military cooperation with India (which was a part of Clinton's talks with Yeltsin in September 1998), the Russians would like to strengthen defence exports.

**T**he reason for Russian interest is clear. Russian military-industry complexes are in great need funds. Despite the initial problems faced by the breakup of the Soviet Republics and dispersion of some defence industry, Russia revived the possibility of re-negotiating defence contracts and the contracts on rocket and nuclear power technology. The US tried to impose sanctions on the Russian firm Glavkosmos when it tried to sell cryogenic rockets to India. But here too, US advice was rejected.

Indian military and defence orders now sustain many defence industries in Russia, especially in St. Petersburg and Irkutsk, which would otherwise have faced closure at the time of transition in the Russian economy. India is the only country with which Russia has a long-term programme of military-technical cooperation, signed in 1994 and valid till the year 2000. This is to be renewed for another 10 years. Between 1992-96,

India imported Russian weapons to the tune of \$3.5 billion. This year the imports already stand at \$800 million. Annual orders from Russian defence industry work out to about \$2 billion. (China is Russia's only other partner on this scale.) Russian MIC Rosvoorouzhenie stated that Russian-Indian military cooperation would touch \$4.5 billion in 2000 and 6.5 billion in 2005 (Times of India, 27 March 1997).

**T**he Indo-Russian agreement on the sale of highly advanced air defence systems, clinched by an Indian defence delegation to Moscow in September 1998, was viewed by the Indian government as a feather in the cap for Indian security, especially in the context of economic and military sanctions imposed by the USA. The Indo-Russian defence deals contribute to the new arms race that has been set off in the sub-continent after the Indian nuclear tests and the Pakistani response in May.

Given the possibility of nuclear tipped Ghauri missiles and the Chinese M-11 missiles acquired by Pakistan, India sent a high level team to Moscow with a long shopping list. Six S-300V Anti-Tactical Ballistic Missiles costing billions of dollars are being purchased. Bilateral military programmes include agreements that both countries help each other's R&D efforts. India has a billion dollars programme with the Russians for the creation of new fighter planes, the SU-30KI fighters. India also gets naval hardware from the Russians and has recently acquired the 636-class submarines. Defence is thus the major component of Indo-Russian relations. It underlies the economic and strategic relations between the two. In fact, it is the most privileged part of the relations.

India and Russia have entered into a cosy state-to-state relationship.

This is a clean break from the old Indo-Soviet relation which, despite its state-centric approach, had advocated a Third World ideology with anti colonialism, a mixed economy and other alternatives to neo-liberal capitalism as an accepted ideal. The new relation has suited the regimes of both states as they aspire to transform their economies to neo-liberal style capitalist systems. The current regime in India has aspirations for regional assertiveness and hegemony, based on militarism in both its domestic and external dealings. That is why the dominant content of the relation between India and Russia is today based on defence contracts. The spiralling cost of defence expenditure appears of little consequence to the governing regime, which privileges threat perception to real development of people.

**R**ussia and India face problems of a similar nature. Economic problems related to the increasing poverty and growing inequality between people in these states is likely to exacerbate social tensions. Both countries face the problem of weak political institutions, pressurised by growing aspirations in their fragile democracies. Both are faced with trends of aggressive nationalism, rise in religious fundamentalism, regional separatism and sectarian movements. Besides the growth of a business mafia and increasing lawlessness, both states suffer the global phenomenon of cross border terrorism and narcotic smuggling. To survive, it is clear that both countries must be more responsive to their people and shift from an elitist, state-centred and realist discourse.

The reality is that a transforming power like Russia and a reforming/developing country like India have dramatic possibilities of collaboration and understanding. The point is to grasp them.

# Improving India-China relations

VINOD C. KHANNA

ON 28 October 1998, Brajesh Mishra, Principal Secretary to the Prime Minister, speaking to a group of media persons declared, 'There are substantive problems in our relations with China but *this does not mean we regard it as our potential enemy*' (emphasis added). This is a significant step in an ongoing damage-control exercise designed to arrest the slide in Sino-Indian relations triggered off by a series of events in April-May, barely a few weeks after the BJP-led coalition came to power.

It is a measure of the national consensus behind the earlier policy of improvement of relations with China that credit for initiating it is claimed both on behalf of Prime Minister Vajpayee—recalling his trip to Beijing in February 1979 as the foreign minister in the Janata government headed

by Morarji Desai — and of the late Prime Minister Rajiv Gandhi — referring to his visit of December 1988. Both these visits were historic but still one may opt for an even earlier Prime Minister, Indira Gandhi, as the true path-breaker. It was she who took the courageous political decision of reversing the increasingly sterile post-1962 bitterness. She adopted a series of bold steps including restoration of ambassador-level relations in 1976. In an inspired move she selected K.R. Narayanan for the job.

In recent years significant progress has been made towards laying a foundation for what is hoped would be a mutually beneficial multi-faceted relationship. Trade, for instance, has more than quintupled during the last decade, and India has overtaken Pakistan as China's most

important trading partner in South Asia. True, our bilateral trade is still rather modest. However, some observers point out that if one includes re-export of Indian goods through Hong Kong to China, the present figure would already be nearer a healthy looking US\$ 4 billion. The two have even begun investing in the other country. Interesting areas of cooperation are emerging in science and technology, culture and even public administration. There have been steadily increasing consultations in international and regional fora on economic, political and security issues.

One of the major barriers to further improvement in Sino-Indian relations has been the unresolved border issue. The issue has got deeply imbued with emotion because of a widely held view in India that China lulled India into complacency in the mid-fifties, professing eternal friendship, while it was actually planning to grab sizeable chunks of Indian territory, partly by stealth and partly by inflicting a humiliating defeat on an ill-prepared Indian Army in 1962. However, with passage of time, as emotions mellowed, recognition has grown that it is in India's interest that we take a more objective look at the territorial issue and the events leading up to the 1962 conflict. The same objectivity is necessary on the Chinese side. We have to accept that tragic errors of judgements were made on *both* sides. A reasonably accurate summary of some of these mistakes can be found in two recent articles by A.G. Noorani in the 14 and 28 August issues of *Frontline*:

In the discussions which have taken place between the two governments in the framework of the normalization process, it has been accepted that the solution to this sensitive issue has to respect the national

dignity and legitimate security concerns of both countries. Clearly, public opinion has to be prepared for 'a fair, reasonable and mutually acceptable settlement' – to borrow the vocabulary used by the two governments – which will inevitably involve some give and take. In India a national consensus accepted by all the major political parties has to be built. Understandably there is a feeling that we cannot surrender away parts of Indian territory. However, the truth of the matter is that even Prime Minister Nehru as late as 17 September 1959, told the Lok Sabha that though Aksai Chin had been shown as part of India in Indian maps, 'It is a matter of argument as to what part belongs to us and what part of it belongs to somebody else.'

By the same token China will have to 'surrender' large chunks of territory which its maps show as Chinese territory. One can also think of imaginative solutions to deal with those few pockets which neither is willing to yield to the sovereign control of the other side. In the meanwhile, backed by sound political leadership, the military and civil officials of the two countries have successfully negotiated a series of measures enshrined respectively in the 1993 agreement on the maintenance of peace and tranquillity along the line of actual control in the India-China border areas and the 1996 agreement on the confidence building measures in the military field.

Occasionally one hears the somewhat curious view that India has gained nothing from these negotiations and that all the agreements have been in China's favour. We have not lost one more inch of territory since 1962. Since these agreements were signed not one shot has been fired in anger along the length of the India-China border or the LAC; not one

Indian soldier has died at Chinese hands. This contrasts rather sharply with what has been happening in the Indo-Pak confrontation. In this context it was heartening to note that Brajesh Mishra took the opportunity provided by the 28 October press briefing to reiterate India's continued commitment to the two agreements.

This evolution of 'peace and tranquillity' along the LAC had taken place against the background of gradually increasing mutual trust. The encouragement which China had extended to some of the internal insurgencies in India during the '60s and early '70s has been terminated. There has also been a decline in the anti-Indian content in the links between China and some of India's South Asian neighbours. Thus, for instance, one today rarely hears the kind of alarm which Indian security experts used to express not too long ago with respect to certain aspects of China's relations with Nepal and, to a smaller extent, in relation to Bangladesh and Sri Lanka.

The Chinese assistance to Pakistan's military – including nuclear and missile – capabilities has been a worrying exception to this trend. Not surprisingly the protestations by China that its relations with Pakistan are normal state-to-state relations are viewed with extreme scepticism in India. It is argued that China seeks to ensure that India is forever constrained by a threat of two-front war and is locked in within South Asia so that it cannot emerge as a rival to China on the wider regional and global stage.

It is important to understand various elements in Sino-Pak friendship which has remained unshaken for more than three decades during which much else has changed on the international stage. It is obvious that shared strategic perspective about India has provided the primary motivation for

this entente. But there have been other important considerations as well:

- \* Through the 1960s, China had tense relations with *both* the super powers; in particular, the threat which China perceived from the Soviet Union became a critical determinant of its policies. As Sino-Soviet relations deteriorated and Indo-Soviet relations grew, security links with Pakistan made eminent geo-strategic sense for China;

- \* Pakistan proved a convenient intermediary when China and USA decided to normalize relations;

- \* China needed a friend in the Islamic world: Pakistan helped China commence relationship with Saudi Arabia and post-Shah Iran;

- \* Friendship with Pakistan should be seen in the context of China's problems with its rebellious Muslim province of Xinjiang.

**S**ignificantly, China did not intervene in any meaningful military sense during the 1965 and 1971 Indo-Pak military conflicts but it has, over the years, extended very substantial assistance in terms of military hardware and technology. It would appear that the Chinese have had a threefold motivation: (i) to ensure Pakistan's loyalty (important for all the reasons mentioned above) by tying her, and particularly its powerful armed forces, to China with bonds of dependence and gratitude; (ii) to ensure China's own security by compelling India to contend with the fact that any conflict could escalate to a two-front war; and (iii) to ensure Pakistan's security by giving it a credible deterrent against India.

The third argument would have been particularly compelling in the years that followed China's failure to prevent the dismemberment of Pakistan in 1971 and may have acquired a nuclear dimension after India's

nuclear test of 1974. It is also possible that there was some *quid pro quo* involved with Pakistan passing on some sensitive technologies acquired by her from other sources.

**H**owever, it cannot be in China's interest to encourage Pakistan to adopt provocative postures against India except in the event of China itself feeling threatened by India. An actual India-Pakistan conflict would present unpalatable choices. This was evident in 1965 and 1971. The emergence of both India and Pakistan as overt n-weapon states has only compounded the problem for China. In case of a serious crisis in South Asia with potential for escalation into a nuclear confrontation, the Chinese would face most unpleasant alternatives. So China does have an interest in peace on the sub-continent and, in particular, in seeing that tension over Kashmir does not escalate into a full-fledged war.

As far as China's grievances against India are concerned, it has been the Tibetan issue which has been at the top of the agenda. The Indian government has gone out of its way – indeed to the extent of courting criticism from champions of human rights – in repeatedly asserting that it recognizes Tibet as an autonomous region of China and that it is determined not to allow Indian territory to be used for activities directed against China. Brajesh Mishra in his 28 October meeting with the press welcomed reports emanating from Beijing that there were some prospects of negotiations between the Chinese government and the Dalai Lama.

All the unresolved problems notwithstanding, few had expected the rapidity and magnitude of the downturn which began with the statements by Defence Minister George Fernandes identifying China as the

No. 1 potential threat (sensation seeking media reports made the statement sound even worse than they were) followed in quick succession by India's nuclear tests of 11 and 13 May, Prime Minister Vajpayee's letter to President Clinton explaining the rationale for these tests in terms of perceived threat from China and China's angry reaction.

Many of us find it difficult to celebrate the Indian decision to conduct nuclear tests but there is little doubt that India's long and hesitant journey in this direction began when China acquired successively nuclear and thermo-nuclear capabilities in the mid-60s. The reports of Pakistan's progress in the nuclear weapon and missile arena, with substantial Chinese assistance, further played into the hands of those who in any case wanted India to acquire weapons which they perceived as the new currency of power and prestige.

**O**viously, China as the only 'approved' Asian nuclear weapon state has a stake in the *status quo*. But there are genuine security concerns as well. China fears that the Indian and Pakistani moves could trigger off a chain reaction leading to unravelling of NPT/CTBT based nuclear non-proliferation regimes with potential long-term threats from some of its other neighbours, in particular Japan and Taiwan. She is also concerned about the destabilizing effect of actions of even such present friends as Pakistan and North Korea.

Careful analysis of Chinese statements on Indian nuclear tests suggests that their initial reaction was relatively mild but turned harsh after the leakage of the prime minister's letter to Clinton, coming on the heels of earlier statements by the defence minister. The fact that this letter was addressed to the American president

was interpreted in China as being a deliberate attempt to build a nexus with anti-Chinese lobbies in the USA. Visitors to China speak of the deeply hurt feelings in the Chinese political leadership which had personally invested in better ties with India over the last few years (see C. Raja Mohan's 4-part 'Beijing Journal' in *The Hindu*, 2-5 November 1998).

From our point of view it was particularly unfortunate that the nuclear tests came just a few weeks before Clinton's visit to China. But while we have every right to resent the tone of the Sino-US joint statement on South Asia, its denunciation of and demands on *both India and Pakistan* went no further than the P-5 joint communiqué and the UN Security Council resolution on the subject.

**T**here is no doubt that there is a convergence of US and Chinese interests on several issues. However, this should not make us assume that there is a more permanent and comprehensive content in their 'strategic partnership' than is actually there. It is wrong to believe that China and USA are moving towards a mutually agreed global duopoly, in which USA and China would divide the world into spheres of influence with South Asia being allotted to Chinese hegemony. This is a simplistic view of *both the US and Chinese policies*. The US is not about to appoint a perceived rival as the hegemony over such a critical area as Asia or any significant part of it; China has its own agenda and profoundly distrusts USA's long-term goals.

It is important that India and China commence a dialogue on nuclear and other strategic issues. Like all other members of the nuclear monopoly club the Chinese have long ago forfeited any moral right to lecture others on the virtues of nuclear non-

proliferation. As things stand, China cannot realistically expect that India will agree to accede to the NPT as a non-nuclear weapon power and to entirely abandon its nuclear weapon programme. Once China comes to terms with that reality it should be perfectly possible to work out bilateral nuclear CBMs and cooperation on global nuclear disarmament issues.

**A**t the 51st session of the UN General Assembly in 1996, China put forward a 5-point proposal on nuclear disarmament calling for drastic reduction of their stockpile by the largest holders of nuclear arsenals, no first use commitment by all nuclear weapon states and unconditional commitment of no threat or use against non-nuclear powers, no deployment outside one's own country, and negotiations for complete destruction of nuclear weapons.

India is perhaps the only other nuclear weapon power which can agree with China on all the above points and can offer to jointly work with China in all international fora on this issue. It should also not be difficult to reach a bilateral understanding on steps like no first use and detargeting. In the meanwhile China would no doubt have noted a whole series of Indian policy statements including the Brajesh Mishra 28 October assurance that India was not interested in entering into a nuclear arms race with China. If simultaneously there is an improvement in Indo-Pak relations, including such CBMs in the nuclear field as non-deployment, it would be possible to demand that China abide by its non-proliferation commitments.

But realistic students of international relations cannot assume that China is about to abandon entirely the role it has been able to carve out for itself in the regional balance of power, especially though linkages with Paki-

stan and to a lesser extent with other South Asian countries. However, it is useful to remember that the Pakistani commentators had watched the earlier evolving Sino-Indian rapprochement with some concern. One of the litmus tests used by analysts of the China-India-Pakistan triangular relations is China's position on the Kashmir issue. As Sino-Indian relations improved the Chinese tried hard to evolve a formula which Indians would find acceptable without offending their Pakistani allies. It began to drop references to the UN resolutions and to call for peaceful resolution through bilateral dialogue though there was some lack of consistency, particularly when it came to statements made in Pakistan, presumably under strong Pakistani pressure.

**T**he Pakistanis were particularly perturbed at the statements made by President Jiang Zemin during his visit to the sub-continent in November-December 1996. Even before Jiang arrived in Islamabad, Pakistani media commenting on his visit to Delhi spoke of India's success in significantly changing the contours of the India-China-Pakistan triangle. The speech delivered by him to the Pakistani Senate on 2 December was seen as hinting at the end of a special relationship with Pakistan. The Pakistani senators could not have relished Jiang's advice: 'If certain issues cannot be resolved for the time being, they may be shelved temporarily so that they will not affect the normal state to state relations.' There is no reason why this trend should not resume once the present crisis in India-China relations passes.

Many analysts who pride themselves on being hardheaded realists tend to dismiss as naïve idealists those who argue that it is both necessary and feasible for India to build mutually

beneficial relations with China. However, true practitioners of *realpolitik* do not base their policies on the worst case scenario but on a calm assessment of probabilities. They do not move on the assumption that any state is a permanent adversary. Recognizing that the international behaviour of countries is motivated by how they perceive their national interests, the realists seek to design an approach which makes even potential adversaries believe that it is in *their* interests to have good relations. They are aware of the permanent role of power in international relations but do not make the ingenuous assumption that national strength is exclusively or even primarily a matter of military might. All this is common sense and does not require learned tomes on strategic theories. The challenge before statesmen is to apply these easily comprehensible principles in a complex and changing world.

**W**hat is the kind of China that India shall have to deal with in coming decades? Over the last twenty years China has achieved the remarkably high rate of GDP growth at an average of 9% per annum. True, there are still horrendous economic problems: rising unemployment or under employment, the uneconomic state-owned enterprises bleeding the national exchequer, fragile agriculture, environmental degradation, stark regional imbalances, and the most imminently dangerous of them all, an indisciplined financial sector. The recent massive floods will also have some negative impact. There is great concern at present about the likely impact on China of the economic crisis in the neighbouring countries. But, it is salutary to remember that according to some serious calculations even if China's GDP growth slows down to 5.5% a year, it would match America's

GDP (though naturally, not remotely the per capita income even if we use the purchasing power parity formula) by 2015. Further, it is objectively true that China needs a peaceful environment in order to proceed ahead with its domestic economic aspirations.

**A** most potent barrier against change of Chinese intentions – or any other major power, for that matter – from benign to hostile is to build with it such a network of mutually beneficial linkages that the cost of switching would greatly outweigh any benefit. A certain degree of fluctuations in our bilateral relations – as between any two major powers – is inevitable. But these swings can be kept within a manageable range. Further, we have to learn to live with *simultaneous* cooperation and competition, friendship and friction. We both have an interest in the emergence of a multipolar world not dominated by a single power. There is space on the international stage for the legitimate aspirations of both China and India.

Some very important consequences follow from the simple demographic fact that China and India are far and away the world's two most populous nations. For a whole range of issues the only country whose experience is really relevant to Indian conditions is China and vice versa because of the sheer scale involved. It is therefore important to appreciate that when we say that India and China have to cooperate and to learn from each other, this is no mealy-mouthed diplomatic jargon: Food and agriculture, employment and education, environment and sustainable development – the list of critical issues on which the two Asian giants can cooperate synergistically is long and the implication for mankind on how these two ancient civilizations handle these challenges is awesome.

# India-Japan and the coming century

BRIJ TANKHA

THE decisive factor shaping Indian interest in Japan in the last two decades has been economic. Japan as a source of capital, technology and trade has motivated our policy planners to work out ways to attract Japanese investment, industrial collaboration, and government overseas development aid to India. Since last year these efforts seem to have been jeopardized as the financial crisis starting from Thailand savaged the economies of many of the Asian tigers and even Japan, that haven of high growth, has felt the pressures and its economy today seems vulnerable and weak.

Added to this has been the political fallout of the nuclear explosions carried out in May by the BJP government. These tests provoked the United States to impose economic sanctions with Japan and other countries following suit and stopping all but humanitarian programmes. Japan has a strong anti-nuclear lobby whose influence cannot be ignored. How will the interaction between the two countries develop and take shape in the coming

years in the context of these changes is of great concern as it touches upon issues affecting not just the two countries but the region as a whole.

The Asian economic crisis, though it began as a currency crisis with the plunge of the Thai baht, has created and reflects immense social and political problems. From the Korean peninsula through the arc of the countries of East and South-East Asia, all are confronted with problems that are undermining their political stability: unemployment, corruption or at least collusion between business and government, sharpening political divisions and a widespread questioning of the existing system. Economically, at least, all these countries are looking at Japan, and of course the United States, to pull their troubled economies out of this crisis. Japan has over US\$100 billion invested in South-East Asia and, therefore, has a strong stake in the region. Yet it is saddled with a lack-lustre political leadership that has yet to take a strong initiative to set its own house in order.

It too faces similar problems even as it takes steps to improve the regional economic environment.

**R**estoring order would require breaking the close nexus between business and government that has worked to mutual advantage, though not always for the public at large. The story is similar to that of South Korea or Indonesia or China. The recent trenchant critique by He Qinglian in *Behind the Pitfalls of Modernization* shows that the crisis is not merely economic but fundamentally moral. Each of the countries in the region are responding in their own ways. Thailand and Indonesia have continued to stress greater openness while Malaysia has begun to enforce greater monetary controls on the movement of capital, blaming the predatory activities of western speculators for a large part of its problems.

Yet they all face serious threats to their present political structure. Indonesia is at present passing through changes that seem to threaten its very cohesiveness buffeted by religious as well as regional strains. The unravelling of an often fragile consensus has had regional repercussions as the ability to act cohesively is undermined. Regional forums, such as the Asia Pacific Economic Commission (APEC) or the ASEAN Regional Forum (ARF) have been considerably weakened. Yet, even as anti-western sentiments are strengthened there is at the same time, for many sections, a stronger agreement that the US, perhaps along with China, is an important factor in ensuring stability in the region.

The economic downturn in Japan, the product of a prolonged recession, has seen the bursting of the financial bubble based on asset inflation. In 1995 Japan suffered a loss of about 4 trillion yen after the Great Hanshin Earthquake that devastated

Kobe and its surrounding region. The current collapse of its asset-inflated economy has, however, depressed the market prices of stocks and land by an estimated 500 trillion yen and 700 trillion yen respectively, a combined loss of 1,200 trillion yen. A staggering amount! Companies and banks have found it difficult to maintain their positions and many banks and financial institutions have gone under; the Hokkaido Takushoku Bank was just the first of many. The figure for the total of bad debts is put at 840 billion yen but many think it may be twice that amount. Japan, like other countries in the region, has taken measures to bail out banks saddled with non performing loans.

**I**n October this year the government proposed a US\$30 billion package popularly known as the Miyazawa Plan, after the Finance Minister Kiichi Miyazawa. The package had two basic objectives. First to fund the nationalization of banks that had failed, viz., the Long Term Credit Bank of Japan, and second to provide funds to bail out banks whose position was precarious and to rescue depositors of failed banks. The effort to rescue these institutions has generated great political debate regarding whether the government is justified in using public resources to rescue private firms that have been grossly mismanaged and where, many felt, the government had to begin with colluded by overlooking or underplaying the seriousness of the situation.

The latest government measure announced on 9 November is a 22 trillion yen package that promises to revive the economy. The concessions the government has offered include 7 trillion yen in tax breaks and the package will involve spending 10 trillion yen of which about 2.25 trillion yen will go to traditional public works

projects and 1.25 trillion yen on other government-led purchases, such as schools and social service facilities. Some 200 billion yen will be spent as a wage-subsidy programme for small and medium sized businesses that want to establish new ventures. The government would pay one-third of the salaries for six employees of qualifying new ventures. And at least 1 trillion yen will go into a loan programme to help qualifying companies that could not get bank loans.

The continuing erosion of the value of assets has deteriorated the balance sheets of private banks imperilling their credit standing and putting further downward pressure on stock and land prices. Yet, paradoxically, a huge amount of money lies idle in household safes and bank vaults. The Japanese are said to have 1,200 trillion yen in financial assets and all this money is 'out of work' as it were. The problem is, as many have suggested, how to put this money to work.

**T**he seriousness of the situation and its effect is not confined merely within the country but has affected overseas operations and investments. Across the board, companies and banks are cutting down their overseas operations. Daiwa Bank and Fuji Bank, for instance, will shut down all overseas operations in less than two years by March 2000. Investments have dropped in China and many countries in Asia. The mood in Tokyo is sombre though the crowds thronging the shops and boutiques would seem to give lie to such a statement.

The measures taken by the government have been criticized by some for being too little and too late, but these combined with other regional aid programmes will hopefully lead to an economic recovery by next year. The United States has urged Japan to help Brazil and in a recent visit by

Prime Minister Obuchi to Russia the government has pledged an aid package. The lowering of interest rates in the United States and the European Union will also, it is suggested, lead to an improvement in the economic scenario. The strengthening of the yen against the dollar points in this direction.

**T**he perspective from India where Japan has been seen as a source of funding large scale projects, particularly in infrastructural development, does not look hopeful. The political fallout of the nuclear explosions has alienated large sections of Japanese public opinion, opinion that has not been particularly concerned or responsive to India at the best of times. India has not occupied a major place in Japanese thinking either at the popular or at the policy level and now sections sympathetic to India have also been alienated. In this situation what is the future of India-Japan relations and are there prospects of future improvements? These are questions that need to be seriously considered and not just from an economic perspective.

Japanese society is facing a host of pressures and the currents now competing for dominance reflect the way its people are re-considering both themselves and their relation to the region. These debates have an important influence in determining the way India-Japan relations will develop in the coming decades. In particular, present views about Asia are germane to the current discussion as they situate the bilateral connections in a context that reflects the place of this relationship.

The past decade has seen an increasing importance given to Asia and Japan's role in the region. Asia has always been a source of tension within Japan. At times it has been seen as an

area with which Japan is bound by ties of culture and values and at other times it has been seen merely as a vast hinterland to be exploited economically and ruled politically. Asia, for Japan, has primarily been the countries of East Asia. This tension in the relationship colours the present interaction. The Japanese government as well as sections of the intelligentsia have sought to project commonalities with the region and suggested that Japan could represent the region in international forums. However, the past and its present treatment continues to haunt and bedevil present projects. The history of the Japanese occupation of Korea and Taiwan, the 'expansion' into China and the co-prosperity sphere in South-East Asia has left questions that have yet to be resolved.

**I**n reaction to the internal criticism of Japan's past aggressions and present hesitation in acknowledging these actions, a growing body of public opinion has begun to argue that such criticism misrepresents the past. In fact, the revisionists argue that Japan has played a role in liberating and making possible the independence of many Asian countries. Fujioka Nobukatsu of Tokyo University has become a leading figure in reassessing Japan's past and, in fact, re-writing history to reflect these views. These statements have been countered by critics decrying the resurfacing or rather strengthening of rightist trends and pointing to the re-writing of history to suit partisan ends. The as yet unresolved problem of 'comfort women' and the need for apology for past actions are also part of this ongoing debate.

Yet, along with this distancing from its Asian neighbours there is also a greater appreciation of the region among certain sections. Courses on Asian countries are gaining in popularity, travel has increased and the

level of information available on East and South-East Asia is high. In the past decade it has also been steadily increasing for South Asia. The current rage among the young in Tokyo is Tamil films and Rajnikant in 'Muthu' (translated into Japanese as *The Dancing Maharaja*) has become a runaway hit.

India's economic relations have always been seen as about to enter a new stage of more intense activity. In the last decade or more the standard formula has been to say that the Japanese are slow in investing in new areas but when they make up their minds they move in a big way. That has not happened as yet but perhaps it will in the coming years. In general, even as companies and business temporarily draw back, there is a wider interest in society at large and this is a hopeful sign. Economic relations with India have improved since 1991; Japanese investments in India is in the region of Rs 62.3 billion and there are over 86 companies with their offices in New Delhi with others in the major metropolitan centres.

**A** survey carried out by the Japan Exim Bank reports that India is considered the second most attractive investment destination in the long term (that is in a 40 year perspective) and fifth in the medium term. Two-way trade has increased by 20%, yet India's share in Japan's global exports is still below 1%. Further, compared to other Asian countries our share in Japan's imports of manufactured goods is also under 1% while China is close to 10%. This obviously points to an urgent need to improve the situation.

And it's not just the figures. Our major exports continue to be marine products, gems, jewelry and iron ore. We have been unable to develop and promote manufactured goods. Again, while ODA has been successful, and increasing Japanese private invest-

ments have only exceeded ODA from 1994-5, so that while private capital flows are gaining in importance they are still small. The major issue facing us continues to be how to build more extensive business ties and this can only be done if a dense network of other ties is built. We have yet to attract the serious attention of the mainstream of Japanese society.

**T**he India-Japan symposium on 10 February 1997 highlighted future areas of cooperation in infrastructural development, telecommunication, food processing and other sectors which hold promise, such as computer software. While these are eminently sensible suggestions there are other areas that need to be highlighted. Japan could obviously be a source for learning about reducing energy consumption and controlling pollution. The symposium mentioned these areas but I think we need to develop cooperation not just at the industry or policy level but also through participatory programmes which ensure that these ideas and techniques are used by the people in their daily lives.

Perhaps it was inevitable but the major interest has been on the economic aspects of the India-Japan relationship. There has been an increase in other levels of contact and exchange but I think this must be broadened further. The bilateral relations between the two countries must not be considered only in the framework of industrial or diplomatic relations. I am particularly interested in seeing a wider level of contact at the political and cultural level. I think a broad-based and continuing exchange, perhaps through the Japan India Centre, if it is ever established; as well as through existing organisations and universities, will help to deepen our links and broaden our understanding. It may also point to new areas of cooperation.

Television is a major tool with a wide reach and we are getting programmes from around the world but little from Japan. The NHK is now broadcasting Japanese programmes through satellite television receivable in all parts of the world. This is a trend that is bound to increase and it will also mean that Japanese companies will possibly broadcast in English and other languages to reach a wider audience. If this trend provides alternative views and opinions it will help to counter the views of an increasingly uniform world media that is dominated by a handful of corporations. We need to have Japanese news, documentaries and entertainment programmes available. We need to learn about the region from the countries of the region rather than through BBC or the pages of English or US newspapers. The internet is another media which should be more generally exploited with greater imagination.

**T**he nuclear blast altered the diplomatic situation of India and created new pressures for the country. The Japanese imposed economic sanctions on India. The official explanation is that these measures, the Japanese do not refer to them as sanctions, were carried out in two stages. The first series of tests on 11 May led the government to suspend grant assistance and it withdrew the hosting of the India Development Forum due to be held in Tokyo. This was similar to the measures it had taken against China when it carried out nuclear tests. This grant assistance which was three times that of what India receives today was only restored two years later when it decided to adhere to the CTBT.

The second series of tests on 13 May led the government to introduce another series of measures: freezing or suspending yen loans (ODA) and take a cautious attitude towards future

lending by financial institutions. The officials deny that there have been any other measures affecting trade or investment. Humanitarian aid is not covered by these measures. Both lending by Japan Exim Bank and trade insurance to India by MITI is not covered by these measures. Along with the United States, Japan has lifted its 'economic measures' against Pakistan because it argues that the Pakistani economy is in a perilous state and that the government is closer to signing the CTBT than India. It continues to maintain these measures against India.

**T**he effect of government policy on Japanese investment is hard to identify. It is too early for the figures to say anything but the general feeling is that there certainly has been a cooling down of Japanese interest in India. This, however, may have more to do with the state of the Japanese economy and the Asian financial crisis than Japan's opposition to the Indian nuclear tests. The weakness of the Indian economy, as reflected in the weakening of the rupee against the US dollar and the falling stock market, is also an important reason.

In considering the bilateral relationship it is clear that Japan's international positions are still well within the US relationship. They are bound by treaty obligations as well as by popular choice and this is unlikely to change. Economically, though Japan may seem to be burdened by problems that have put a brake on the 'miracle growth', it would be prudent not to write off the economic strength of Japan. It may not be functioning as if it is on steroids but it has fundamental strengths and dominates the greater part of the Asian region. Initiatives to strengthen the bilateral relationship cannot focus only on attracting investment and trade but need to broaden an Indian constituency within Japan.

# Relating to the OIC

SYED SHAHABUDDIN

THE Organization of Islamic Conference (OIC), established in 1969, has the character and framework of an Inter-Governmental Organization (IGO). Its membership is not universal – neither globally nor regionally – and spans a string of states, supposedly with a common Islamic character.

Though aiming at realizing the concept of Islamic solidarity, the OIC is not a religious organization or institution and has no authority to issue *fatwas* (religious edicts) binding on the Muslims, individually or collectively, in the member states or in the rest of the Muslim world. No Muslim state, nor the OIC today, performs the religious role of the Papacy. In any case the OIC does not enjoy any territorial sovereignty like the Vatican.

OIC membership is open to every Muslim state though the term is not defined. Beginning with 25 in Rabat, the OIC now has 54 members with the following regional break-up: West Asia 14; South Asia 5; Central Asia 6; South East Asia 3; North Africa 8; Central and South Africa 17; Europe 1.

Though the overwhelming majority of the OIC states are Muslim majority states but, surprisingly, some Muslim minority states have also been admitted as members. Most of these states are not Islamic states in the sense that their constitution does not recognize Islam as the religion of the state or that Islamic jurisprudence (*Shari'at*) is not the exclusive or primary source of legislation or that the headship of the state or of the government is not formally restricted to a person professing Islam.

The members of the OIC vary widely in area and population as well as in their per capita income. In area,

Kazakistan with 2.7 million square kms is the biggest, followed closely by Sudan with 2.5 msk. At the other end of the scale are states like Benin and Maldives with a few thousand square kilometers. Similarly, in population, according to the latest available figures, Indonesia leads with nearly 200 million while at the other end one finds a state with a population of few hundred thousand people. In terms of per capita income, at the top are oil-exporting countries with comparatively small populations.

The OIC functions on a relatively small budget which is largely funded by Saudi Arabia. Its headquarters in Jeddah does not show any sign of round-the-year activity. On the eve of the meetings of the General Assembly and other key organs of the United Nations, the OIC comes to life and tries to play a role in the international arena, particularly through consultations with UN organs as well as coordination among its members on the major issues of common interest.

In October 1982, the United Nations General Assembly adopted a resolution establishing a regime of cooperation between the UNO and the OIC. The UN Secretary General since then has been presenting annual reports to the UNGA on cooperation between the two. The UNGA in its annual resolution takes note of the SG's report and conclusions and the recommendations adopted by the general meetings of the OIC with the various organizations and agencies of the UN system, requests the UN and OIC to continue their cooperation in the common search for solution to global problems including disarmament, self-determination and human rights and

welcomes the information exchange, coordination and consultation with a view to developing the modalities of the cooperation.

**B**y and large, the UNO-OIC cooperation appears to be an image building exercise for the benefit of the bureaucracies of both the organizations. Thus it does not add in any meaningful way to the commitment, allocation and contribution of the UN system to any OIC state. However, the expanding spectrum of cooperation *per se* shows the pressure that an IGO, which represents nearly 1/3 of the membership of the UN, can exert on the UN system and on its priorities. Additionally, in the case of small states, the consultation mechanism provides them some leverage to exact more from the UN system than would have been otherwise possible by their own efforts.

It may be noted that while all OIC states are members of the UNO, they are also members of various other international IGOs. For example, all African states are members of the OAU; all South East Asian states are members of the ASEAN; all South Asian states are members of SAARC; the Arab states are all members of the Arab League; and the Central Asian states are members of the CIS, the Commonwealth of Independent States. Nearly all of them belong to the Non-Aligned Movement (NAM) and the Group of 77.

35% of the world Muslim population resides in Muslim minority states such as India, China, Russia, USA, France, UK, Germany and Bosnia which serve as major hosts within the cut-off limit of 1 million Muslims or 10% of the national population.

The OIC charter does not make any provision for an alternative form of association of Muslim majority states, which may not like to become full members, or of Muslim minority

states or of Muslim minority communities living in those states. However, some states like Cameroon and Nigeria, which were originally admitted as observers, later became full members. But Mozambique, a Muslim minority state, Northern Cyprus (a part of Cyprus under Turkish occupation which is recognized by Turkey as an independent state) and Zanzibar (an autonomous part of Tanzania) have been admitted as observers though the charter has no provision for observer status in respect of states or organizations or communities.

**F**rom time to time representatives of Muslim minority communities or of Muslim communities inhabiting a part of a Muslim minority state where they form a majority have participated as observers, for example, Arakan (Myanmar), Mindanao (Philippines), Kashmir (India), Chechnya (Russia), Bosnia (Bosnia-Herzegovina) and Patani (Thailand) to the chagrin of some and the acquiescence of others. It may be noted that representatives of Muslim minority communities, denominational or linguistic or racial from OIC states, like the Kurds (Turkey, Iraq, Iran, Syria), Sunnis (Iran) or Shias (Bahrain and Saudi Arabia) have never been invited or admitted nor have their problems or aspirations ever been addressed by the OIC.

One fails to comprehend the term 'Islamic solidarity' used in the charter, particularly whether it means solidarity among the Islamic states or extends to Muslim communities in non-Muslim states, and whether it commits the OIC collectively to support the latter on merits of the case. One thus senses in this term the potential of the OIC, collectively, and of the OIC states, individually, for interfering in the internal affairs of the Muslim minority states like India. It is, how-

ever, noticeable that apart from Palestine no other territorial problem like Kashmir, Mindanao, Arakan or Patani are specifically mentioned in the charter.

With reference to the principles enshrined in the OIC charter it may be argued that they apply only to interstate disputes among the OIC states and not to those between an OIC state and a non-member state. But the OIC will have scant logic on its side if it supports the violation of those principles by any OIC state or by itself in dealing with a non-member state and thus expose them to reciprocal interference by the other states. Similarly, if respect for the right of self-determination cannot be strategically applied to support secessionism or separatism in the OIC states, the OIC has to be extremely cautious in extending support to such movements in non-members states in the name of strengthening the struggle of the Muslim people for dignity, independence and national rights.

**T**here is thus a delicate balance between the natural desire of the OIC states to maintain their own sovereignty, independence and territorial integrity and their pan-Islamic aspirations. It is significant that the word 'sovereignty' has not been used to define the objective of the struggle of the Muslim people. Sovereignty in the democratic age resides in the people, but the UN charter and several international documents use the term self-determination in a manner that connotes independence as its only possible manifestation. Above all, the fact that many OIC states face secessionist and separatist movements within their own domains perhaps acts as a restraint on the OIC extending support to such movements in the rest of the world.

Generally, the OIC has adopted a very low profile in dealing with the

problems of Muslim minorities. The secretariat has a department of Muslim minority affairs and since 1975 it has presented successive reports on Muslim minorities to the meetings of the foreign ministers. But apart from adopting long-winded resolutions, neither the meetings of the foreign ministers nor the Islamic summits have done anything to pursue the cause of the Muslim minorities. If the OIC has shown any interest, it was for the record but hard words break no bones. The OIC has never pledged itself to take any active role in any minority situation except in Mindanao which was taken up at the request of and with the consent of the government of the Philippines.

**O**ne factor behind such restraint, as exercised by the OIC, is no doubt its consciousness of the existence of many skeletons in its own cupboards of the existence of minority problems and separatist movements which many members have been facing and suppressing in a ruthless and sometimes brutal manner. Many OIC states have used state power not only against the secessionist and separatist elements but the radicals and the fundamentalist groups. Some OIC states have not hesitated to use their armed forces against their own people clamouring for democracy or autonomy or human rights.

The OIC resolutions and declarations should not be taken very seriously because individually its members do not subscribe to the same ideology or speak with one voice or adopt the same tone or are in a position to commit themselves operationally. A regional and near-global power like India can take such resolutions and declarations in its stride. But it need not take cover behind the outmoded concepts of national sovereignty and domestic jurisdiction. It can evade censure or

criticism if it explains its position on the questions in dispute and projects the sincere efforts it has been making to resolve them and to find durable solutions.

**S**ome OIC states see a messianic role for themselves. At one time or the other Pakistan, Saudi Arabia, Egypt, Iran, Iraq, Libya and the Sudan have tried to don the mantle. Multiplicity of such claims itself sets up a mutual conflict of interests and leads to one claim being cancelled by the other. There is little reason to apprehend that at any given juncture all of them may gang up or back a holy crusade, a *jihad*, against India. One should not forget that even the frontline Arab states have not been able to coordinate their fire-power against a common enemy, Israel, which has been at the centre of their concern since the 1920s, though the liberation of Palestine forms the basic *raison d'être* and an explicit objective of the OIC.

To sum up, Muslim minorities have never figured on the priority agenda of the OIC. Its general approach has been to largely ignore the problems of Muslim minorities which constitute over one-third of the Muslim population of the world, treat them symbolically and play it cool. The department of Muslim minority affairs of the OIC secretariat has been sparsely funded and thinly staffed and its Muslim minority committee has been largely inactive. The OIC secretariat has no doubt presented successive reports on the question of Muslim communities in non-Muslim states to the meetings of the OIC foreign ministers who have regularly passed their long-winded resolutions almost with the same phraseology, slightly amended. But, the OIC general secretary or the secretariat has not pursued these resolutions with any commitment or purpose. The OIC has often

spoken for the record and has not adopted or pursued any active role in Muslim minority situations.

The Muslim states are not monolithic. Like the rest of the world they have faced a surge of ethnicity and the emergence of multiple identities within their domains, based on race, language or culture and spurred by geography, history or economics. In my view, the OIC is incapable of taking a coherent stand on the question of minorities, religious or otherwise, until and unless its member states come to terms with the non-Muslim or ethnic or sectarian Muslim minorities in their own domain and learn how to deal with border problems, created by trans-border ethnicities and the subsequent demand for self determination in accordance with internationally accepted norms.

**I**ndian policy toward the OIC has gone through a number of changes. It may be recalled that India was invited to the 1969 Rabat summit but it was forced out, or asked by the host Morocco to withdraw, to meet the objection of Pakistan. It is interesting to note that as an invitee to and participant in the Rabat summit, at least till it withdrew, India has a claim to membership of the OIC under its charter, though the membership is conditional upon accession to the charter after it was adopted in 1972.

Over the years India has built up bilateral diplomatic, economic, commercial and cultural relations with a number of OIC states, including all major players which are important to India from the point of view of bilateral trade or emigration of Indian labour.

The overall level of India's economic relations with the OIC countries is very low. Only with Turkey, Bangladesh, Indonesia, Iran, Malaysia, Saudi Arabia, UAE, Egypt and Nigeria, our export exceeds the annual level of

Rs 500 crore. One is particularly hopeful of bilateral economic relations with Pakistan and Bangladesh picking up with the coming into operation of SAFTA and overall improvement in political relations. From the point of view of imports into India, our major partners are Indonesia, Iran, Malaysia, Bahrain, Jordan, Kuwait, Saudi Arabia and UAE. It will be seen that most of them are oil-exporting countries with the exception of Jordan which is a major supplier of phosphate rock for the fertilizer industry.

While Israel has emerged as a major investor in India, no OIC state has a comparable interest. It is, however, expected that Saudi Arabia, UAE, Kuwait, Qatar, Bahrain and Iran may enter the Indian economy in a big way in the foreseeable future. Conversely, India has very limited investment in the OIC states—largely located in Indonesia, Malaysia and UAE. From the point of view of manpower export Saudi Arabia, UAE and Qatar have emerged as major destinations.

**A**t present India has resident diplomatic missions in most of the OIC states, with the exception of Albania, Benin, Bosnia-Herzegovina, Burkina Faso, Cameroon, Mauritania, Niger, Sierra Leone and Somalia. Among these, India has accredited non-resident missions to Gabon, Guinea Bissau and Mali, India has consular representation in Djibouti and Sierra Leone.

In the global context India should establish diplomatic relations, at least through concurrent accreditation, with the remaining OIC states and also ask Bahrain to establish a resident mission in New Delhi. Later, India may establish a small resident mission in every OIC state consisting of an Ambassador or a C.d'A with a supporting home-based staff.

Since its bitter experience of 1969, India has tried to underplay the

OIC and even questioned its legitimacy by calling it a religious organization. Far from publicly endorsing the idea of any form of association or cooperation with the OIC, perhaps Indian policy-makers apprehend exploitation of the OIC by Pakistan and any other OIC state hostile to India. This is a genuine apprehension as the OIC is based on the concept of 'Islamic solidarity' and is seen likely to show sympathy for the Muslim side in any internal issue or external conflict of interest with a non-Muslim state.

**T**he bitter pill which India had to swallow in Rabat in 1969 due to the insistence by Pakistan and the acquiescence of the host, Morocco, has thus made India very sensitive on the question of association or cooperation with the OIC. For one thing, India has consistently resisted the idea that questions of national importance like the status of Jammu and Kashmir and the treatment of the Muslim Indian community may be discussed in any international forum. This applies much more to the OIC.

There have, however, been some informal consultations between the Government of India and the OIC secretariat through its missions in Riyadh and Jeddah or through visiting secretaries. But India has so far abstained from establishing any permanent machinery for maintaining regular contacts with the OIC. The OIC has on several occasions expressed a desire to send special missions, particularly to study the situation in Jammu and Kashmir, but the Government of India has formally rebuffed such overtures.

The question whether India should seek membership or observer status with the OIC has long been under consideration. The Government of India presumably feels that with its extensive contacts with the major OIC

states, as well as with its global connections, it can successfully deal with any interference or intervention by the OIC as an institution in Jammu and Kashmir or in the situation of the Muslim Indian community.

The Government of India also feels that other multilateral fora such as the Arab League, the OAU, ASEAN and, above all, SAARC, the NAM and the Group of 77, of which India is itself a member, can provide fora for informally restraining the OIC from taking undue interest. Since India aspires to play a key role in evolving, formulating and projecting the common policies of the non-aligned and the developing world on global issues, this role may restrain even those OIC states which nurse sympathy for Pakistan's claim on Jammu and Kashmir or for the right of the people of Jammu and Kashmir to self-determination or a sense of solidarity with the Muslim Indians.

**P**erceiving the Muslim world as a house divided between the progressive, secular and democratic forces on one side, and the orthodox, religious and anti-democratic forces on the other, from time to time India has publicly aligned itself with one and against the other, chosen to be friendly towards the first and cool, sometimes critical, towards the other. These feelings were naturally reciprocated. These defining lines have not stood the test of time and our policy of discrimination has proved to be counter-productive in developing relations with some of those countries.

During the heyday of Nasserism, India became associated with pro-Nasserism and, by definition, hostile to those states which stood against Nasser. One may question whether this did not amount to intervention in an essentially intra-Arab and intra-Muslim conflict and in the long run did

not damage our national interest. In any case India had no power—military or economic—to push the Arab or the Muslim world in any desired direction. It never had any real option but to deal with the Arab Muslim states as they were, irrespective of the ideological complexion of the ruling elite or the relations among themselves.

**I**t may also be kept in view that such family disputes have a way of being resolved through consensus or compromise often leaving the committed sympathizers high and dry on the sidelines, e.g., in the post-Nasser era in the Arab world. Thus while the Arab-Islamic world has become increasingly important to India in a strategic sense, Indian diplomacy has failed to evolve a matching sophistication. Sometimes it looked as if in a raging sea Indian diplomacy had become an anchorless ship, with no safe port-of-call within sight and no pilots familiar with local navigational hazards.

India thus began on a wrong note by delineating the OIC as a religious organization which OIC was not and was not intended to be and by taking sides in Arab and Muslim politics. India should have recognized that it was a political organization, an inter-state forum, and an IGO. India also looked upon the OIC as dominated by a conglomerate of the orthodox, anti-secular, anti-democratic and even feudal states in the Muslim world which the OIC was not. It was a joint enterprise of a large number of states which shared a common Islamic ethos deriving comfort and seeking support from each other in their dealing with internal and external challenges.

The pan-Islamic consciousness, to the extent that it existed, was directed against communist and colonial pressures. Its development and discourse had a progressive nuance, which Indian policy-makers had

missed. By raising its collective voice for national rights against neo-colonial exploitation, particularly in relation to the non-renewable natural resources, by projecting Islam as a force against imperialism and communism and as compatible with science and technology, democracy and human rights, the OIC states have participated in the larger battles of the Third World against both the capitalist and communist faces of the West and in the movement towards modernization.

**T**he Indian policy-makers should also have realized that the pan-Islamic consciousness or solidarity largely operated at a sentimental or emotional level, that it amounted to no more than what is called *ummah* consciousness and that the OIC states, individually or collectively, were in no position to intervene in situations of Muslim separatism or militancy anywhere, except with the goodwill and consent of the state concerned as in the case of Philippines and Thailand, to help resolve the conflicts. On the other hand, ideological states like Libya, Iran and Iraq and now Sudan, did whatever they wished to do in the Muslim world and outside, but outside the framework of the OIC and not through it.

In the final analysis, India's policy-makers appear to have exaggerated the threat of exploitation of the OIC by Pakistan in its territorial designs over Jammu and Kashmir and over the treatment of Muslim Indians and this has determined the Indian response.

No state in the modern world can take the position that a problem does not exist or that the world should overlook it. It cannot attribute its own mistakes, failures and weaknesses as an illusion or a figment of imagination or attribute them to subversion and

denigration by its rivals or adversaries. India has indeed never taken a position that minority problems or problems with Pakistan do not exist except in Pakistan's imagination or in the mind of those who are out to subvert and denigrate the Indian state.

India should have realised that the member-states of the OIC which have large non-Muslim minorities themselves and face separatist or secessionist movements, which have border disputes with their neighbours, which are distant from South Asia, which have economic or historic ties with India, which seek international support to a cause of primary concern to them, which have a large Indian expatriate community, cannot and will not adopt an anti-Indian stance. Even, some of these states with special ties with Pakistan such as Turkey, Afghanistan, Malaysia, Indonesia, Iran and even those smaller states to which Pakistan offers special favours or to which it pays special attention may not fall in line, as they may prefer to remain silent or neutral within the OIC, on a balance of considerations.

**T**he OIC, therefore, may pass a formal resolution or adopt a formal declaration but its members do not speak with one voice or in one idiom or with the same tone or emphasis on issues which are not of direct interest to them. One may think that on India's entry, bilateral problems with Pakistan would become intra-OIC in character and the OIC has traditionally been less vocal and demonstrative on intra-OIC problems. A strong state like India can take such resolutions and declarations in its stride but it can also do with an opportunity to gain support and understanding by explaining its position on internal problems that exist, as they do in any country, in terms of the sincere efforts the Indian state has made to resolve them and find durable

solutions and thus appeal to the understanding of those within the OIC who face similar problems.

**O**n the other hand, some states with bilateral problems with their neighbours, e.g. Pakistan and Turkey, could try to use the forum to mobilise support for their national causes, particularly from some small OIC states and court them with special favours or gestures. But even they may prefer to remain silent.

India may adopt a multi-pronged approach and build up its weight and credibility not only in the OIC states but all over the world by setting its own house in order, practising what it preaches, defending the secular order against internal subversion, ideological or majoritarian, protecting minority rights in accordance with its own Constitution and international documents to which it is a party, curbing anti-Muslim violence and anti-Islamic propaganda, coming to terms with Kashmiriyat by granting autonomy, short of sovereignty, to the Valley and establishing a regime of peace and progress in the benighted state.

Counselling OIC on common problems of international concern, taking their common concerns into account in determining Indian policies, within the NAM, the Group of 77, developing political, economic, cultural and technical cooperation with each OIC state without any ideological differentiation, seeking observer status with the OIC (but refusing membership, even if offered), establishing a permanent representation to the OIC for regular interaction and, if desired by the OIC, permit it to set up a representation in India (as in the case of the PLO and the Arab League) and receiving OIC missions to India, as in the case of the EU, as well as developing mutually beneficial relations

with the established institutions and organizations of the OIC in the field of education, culture, development, information, language, science and technology, projecting India's Islamic face and using eminent Muslim Indians, officially and unofficially, as bridges to the Muslim world, India can successfully counter the element of hostility in its interaction with the OIC and even isolate Pakistan, the prime mover, if it persists.

**I**ndia should also seek to strengthen and expand relations with Pakistan, and promote cooperation within the framework of the SAARC.

\*India should, therefore, give serious consideration to evolve a mutually compatible form of association. It should refuse membership of the OIC even if offered, in order not to provoke Hindu reaction in India, but should express its inclination to accept the status of permanent observer in the OIC and to accredit a permanent representative to the OIC, if the OIC charter is suitably amended to admit non-Muslim majority states with a substantial Muslim minority of, say, over 10% of the national population and/or exceeding one million.

\*India should seek to establish continuous interaction with the OIC at least informally till India is admitted as observer. This would open the door for OIC missions to visit India and have regular exchange of views at official and non-official levels. The foreign office should brief OIC ambassadors in Delhi regularly on matters of concern to the OIC relating to India or otherwise, consult OIC formally on matters of international concern in determining Indian policies such as questions on the agenda of the NAM, Group of 77 and even the Group of 15.

\*India should also develop constructive and cooperative relations with specialized institutions and organiza-

tions of the OIC particularly in the field of education, culture, language and law and give them access to the Muslim community and Muslim organizations in India.

\*India should deal with and develop political, economic, cultural and technical cooperation with every OIC state without any ideological differentiation. But it should identify OIC states with special ties to Pakistan and develop matching relations with them, man for man and rupee for rupee.

India must realize that the Muslim world is neither monolithic nor homogeneous. In fact, few Muslim states are even racially or denominationally homogeneous. The Muslim world is also facing the same surge of ethnicity and of identity, based on sect, race, language and culture, spurred by geography, history and economics, as the rest of the world. The OIC, an inter-governmental organization, all of whose members are committed to their existing boundaries is incapable of taking a coherent stand on this supreme political question of the 21st century, the question of ethnicity. The OIC states simply do not know how to deal with such situations and the consequent trans-border movements when ethnicity either transcends national boundaries or experiences claustrophobia.

**T**he OIC will definitely survive into the 21st century but its state of health, vigour and vitality and its impact in the international arena will depend on the interest of the major Muslim majority states in using it, individually as well as collectively, for evolving a coherent consensus in dealing with each other or with other non-member states or with the international community and taking a constructive stand in the deliberations of other inter-governmental organizations on international situations.

# New pathways

RAJEN HARSHE

INTERNATIONAL relations after the Cold War are increasingly perceived and interpreted in the broader context of globalization. The term globalization, most often, is deployed in the current discourses in international relations to capture a panoramic view of growing and complex forms of interdependence, symmetrical as well as asymmetrical, in a unifying world. Thus, internationalization of multiple set of activities has to inevitably precede globalization. The latter, by definition, promotes free flow of ideas, information, goods, services, capital, values, arms, technology and images across national frontiers on a world scale.

The patterns of integration unleashed under globalization are likely to continuously increase, widen and deepen in the coming decades. Evidently it is rather difficult to visualize, with some measure of accuracy, the implications of a constantly unfolding phenomenon such as globalization on international relations at this stage. However, it is feasible to identify a few major and durable trends. This article is a modest attempt to identify such trends in order to search new pathways for India to meet the challenges

of globalization. We begin by analyzing the advent of capitalism and its association with globalization.

The accentuation of the phase of globalization coincided with the emergence of capitalism as the most dominant mode of development after the Cold War. In fact, by the early nineties, most of the East European countries from the former socialist bloc and the member states of the Commonwealth of Independent States (CIS) that succeeded the Soviet Union, opted to pursue capitalist development. A number of Third World countries like Vietnam, Angola, Mozambique and Ethiopia almost abandoned their socialist experiments in favour of capitalism. What is more, even China embraced a variant of capitalism through its conscious policy of bolstering an alternative of market socialism. In a word, since the last decade of this century, capitalism blossomed as a mode of development and as a world system.<sup>1</sup>

1. It is difficult to arrive at a neat definition of the term capitalism. However, as a resilient system, capitalism can be broadly identified with the following realities: (a) private/corporate ownership of the means of production, (b) growth and development of wage labour,

Although the process of globalization cannot be reduced to capitalism, the relationship between capitalism and globalization is inextricably intertwined. Capitalism certainly is a vehicle to promote globalization and *vice versa*. Obviously, the process of globalization would subsume combined and uneven development of different regions, nations, states and social classes because this phenomenon is rooted in the logic and parameters of capitalist development. In the advanced capitalist countries of the West, the process of uneven development has more often been accompanied by an uncanny flexibility of capitalism to accommodate egalitarian pressures generated by diverse protest movements.

**A**part from a wide range of anti-systemic and left oriented forces from the outside, capitalism has its critics from within as well. For instance, George Soros, an international financial magnet, in his trenchant critique of post-Cold War capitalism has underscored the nature of capitalist threat to any open society. This threat can manifest itself, rather glaringly, in the capacity of capitalism to promote excessive individualism leading towards intolerable social disparities and unbridled exploitation of the masses.<sup>2</sup> Thanks to its opponents from diverse quarters, capitalism has acquired the resilience to adapt itself to changing conditions and displays an intrinsic ability to outmanoeuvre competing ideologies and coopt its most radical opponents. Obviously, it has an enormous staying power that has consistently sustained its potential

(c) relationship between wage labour and capital characterized by a melange of conflict and cooperation and, (d) an in-built drive to stimulate the process of accumulation and reproduction of capital.

2. George Soros, 'The Capitalist Threat', *The Atlantic Monthly*, February 1997, pp. 45-58.

to operate on a global scale. In the light of these observations it is possible to discern certain major trends in international relations under globalization as follows.

**T**he impact of the process of globalization could be appraised at three different levels, i.e. global, regional and state. Admittedly, these levels are interconnected – the dividing lines between them being drawn for sheer analytical convenience. At the global level, globalization is likely to force a multiplicity of social organizations across nations, states, civilizations and continents to coexist in a compressed space. In essence, globalization would eventually build the world into a single space by constructing diverse patterns of social relations across distances. Such togetherness, in its turn, would be pregnant with the possibilities of varying and complex forms of multilateral cooperation as well as conflict.

For instance, new forms of cooperation are already conspicuous through the operations of transnational conglomerates which coordinate their activities across states. The main strength of these gigantic organizations can be perceived in the growing significance of intra-firm trade. The functioning of transnational firms has been facilitated by financial deregulation which in turn has stimulated the flow of foreign direct investments (FDI) on the one hand, and mobilization of capital and currency and capital markets on an unprecedented scale, on the other.

The phase of globalization as it unfolds would also witness the rise of transnational regimes and movements. Some of the existing transnational regimes such as the World Trade Organization (WTO), the International Monetary Fund (IMF), the World Bank and the nuclear regime

upholding the banner of Comprehensive Test Ban Treaty (CTBT) are already operating in full swing.

In general, the growth of transnational regimes would be accompanied by the proliferation of transnational movements. The latter would primarily be shaped by the growing strength of inter-societal networks across the world. Such networks would pave the way for the emergence of international or global civil society that would obviously function without a global state. In fact, issues like the protection of human rights and environment, prevention of child labour, women's emancipation, poverty alleviation, and prevention of cross-border terrorism as well as internationalization of crime are already binding people the world over in rudimentary forms of transnational movements.

**T**he phase of globalization, paradoxically, is witnessing the growth of regionalism and the consequent advent of regional organizations. The old regional organizations are being adapted to new conditions while new ones are getting formed. Evidently, the response to globalization at the regional level can be well appraised by understanding the nature and functioning of diverse regional organizations all over the world. Any worthwhile analysis of the functioning of organizations like the European Union (EU), the North American Free Trade Agreement (NAFTA), the Association of South East Asian Nations (ASEAN), the Southern African Development Community (SADC) and South Asian Association for Regional Cooperation (SAARC) amply illustrates this proposition.

What is more, apart from promoting cooperation in economic, commercial and politico-strategic spheres, the states are also promoting

transnational religio-cultural organizations. The predominant role of the Organization of Islamic Countries (OIC) in West Asian and international affairs is a case in point.

**F**inally, the contemporary state is witnessing existential strains under globalization. The paradoxical predicament of the state could be placed thus: On the one hand, the state is the main agency through which agreements towards the promotion of transnational regimes and regional organizations are being worked out. On the other, the transnational regimes and organizations almost carry the mandate through these agreements to circumscribe the powers of the state to ensure their smooth functioning. Thus, organizations functioning at the global or regional levels do and will continue to impinge on state sovereignty from above.

In addition, the state faces the challenge from intra-state conflicts from below. The rise of secessionist movements based on ethnic nationalism in states including Sri Lanka, Iraq, Iran, Canada, India, and Rwanda are cases in point. Similarly, the advent of Islam has disturbed the internal harmony of states within the entire Muslim world. Most separatist or religious movements have internationalized their struggles.

In substance, such struggles have offered space to local and international forces to converge. Therefore, the growing significance of sub-national and transnational forces coupled with their alliances under diverse conditions and of different magnitudes, can cumulatively undermine the pre-eminent role of the state in international relations. Evidently, the distinctions between what could be termed as internal – within the state boundaries – and external – outside the state boundaries – are inevitably

getting blurred in these processes. In view of these trends, we can proceed to examine how India's foreign policy could meet these challenges under globalization.

India has already started to entertain a vibrant and interactive relationship with the main trends under globalization. Such interactive involvement allows it to reorient its developmental alternatives as well as foreign policy. Carving out an imaginative development strategy in the context of globalization is perhaps the major challenge before India. A combination of certain compelling domestic as well as international factors virtually drove India to meet this challenge by initiating the process of reforms in 1991.

**F**or instance, certain domestic factors like the dismal performance of a large number of public sector units, depleting foreign exchange reserves leading to a balance of payments deficit and growing cynicism about the inefficacy of any socialist order had brought the Indian economy to the brink of disaster. Moreover, with the disintegration of the former Soviet Union, India lost a dependable ally. For, India had consistently consolidated its mutually beneficial politico-strategic, economic and military ties with the Soviet Union over three decades.

In the light of its malfunctioning economy as well as the demise of the Soviet Union, India opted to revive its economy through reforms. Such reforms entailed various measures of liberalization and the consequent rolling back of the role of the state in the economy. Moreover, the reforms had to be made acceptable across a wide spectrum of political parties through consensus building in a democratic polity. The Rao regime straddled this path quite admirably. By now, practi-

cally all the major political parties are willing to encourage private initiative in business, contemplate closure of the sick public sector units and take appropriate measures to liberalize the Indian economy to encounter the phase of globalization.

What is more, the state in India could deal quite effectively with international regimes like the IMF and the World Bank while undergoing the initial years of the phase of reforms. In a word, India, by now, is poised to evolve its own form of welfare capitalism in a world that has been almost eclipsed by capitalism as the major development paradigm.

Admittedly, India is entering the phase of globalization without preparing for it. For instance, certain glaring social realities such as neglect of primary education, health care, socio-economic inequalities, including gender inequalities and the virtual absence of land reforms on a significant scale are likely to have adverse impact on India's performance while it navigates through this phase. Despite these handicaps, India can rise to the occasion by using the opportunities thrown up to its advantage by searching the new pathways in the following manner.

**A**t the global level India can evolve several ways to ensure its effective survival under globalization. To begin with, there is a growing trend to establish large regional markets. Such markets are being built through inter-state collaborations. Organizations like the EU, NAFTA and ASEAN amply illustrate this proposition. However, unlike these organizations, India constitutes a large market in itself. Hence it could effectively relate to this global trend by constituting a single market out of several fragmented regional markets. If a sub-continent wide regional market can be formed in India by abolish-

ing tariff and non-tariff barriers among states, India could emerge as a powerful country.

Experts on business like Prakash Hebalkar have strongly advocated the establishment of a national trade commission to attain this goal.<sup>3</sup> For, without internal single market India will not be able to build a world class home market. Among the Third World countries, India has the potential to become a world scale market. By building its emerging market on a world scale, India can open up its economy to new products and services. Thus, Indian consumers can also access advanced products and services at low prices which can generate new jobs as well.

**F**urther, the upgrading of the Indian market to products and services would imply gaining access to new technologies and attracting investments from industrialized countries. The transnational firms are likely to be catalysts in providing new technologies and investments. Evidently, their role in terms of diverse domains, including joint ventures or participation in manufacturing products and building services in India, will have to be worked out in greater detail.

Furthermore, in a rapidly shrinking world India needs to step up its exports and recast its trade relations as a whole. In the sphere of export promotion India can concentrate on the export of services where it has distinct advantage due to sheer size of its trained manpower. For instance, well over a million professionals of Indian origin have played a pivotal role in the economies of the advanced industrialized countries. The trained manpower in India could as well be deployed to promote developmental goals of the developing countries by

initiating collaborative arrangements with a number of Afro-Asian countries. Unfortunately, India has yet to utilize its full potential in the service sector. India's trade and commercial ties, in general, need to be reoriented in the post Cold War world. In the process of forging such ties India will have to conceive a mix of change and continuity in its external policy. To put it tersely, forging and consolidating economic and commercial ties with post-Soviet Russia and the process of wooing the new regional markets like the EU will have to go hand in hand. The ties with the former are already being set on the rails by Indo-Russian joint working groups. Promoting substantive links with the EU countries would demand more proactive diplomacy backed by sound research in the economic and commercial spheres.

**H**owever, improving the prospects of economic and commercial ties with the external world is inconceivable without developing an integrated ocean policy. India's foreign policy, at this juncture, must have a well thought out maritime perspective. Indeed, in the light of the growing role of extra-regional powers in the Indian Ocean, a considerable rethinking is required about India's strategic frontiers. Strategic frontiers, according to Vishnu Bhagwat, define a nation's interests on considerations of geo-politics, geo-strategy and geo-economics.

India will have to give up its obsession with immediate territorial boundaries and take an overall view of strategic frontiers to safeguard its core interests.<sup>4</sup> India's strategic frontiers cover almost all the significant regions of the Indian Ocean such as West Asia, (including the Persian Gulf), the Red Sea, the western littorals and the Pacific upto the South

China Sea. These strategic naval frontiers, in their turn, are going to influence the course of India's trade.

**T**he promotion of trade and commercial ties with other countries is feasible only by boosting the energy security of the productive units. In order to bolster its energy security India will have to import oil, gas and downstream products from either the Gulf states or other diversified sources like the Central Asian and African states. This would involve planned preparation for sea transportation. Conscious efforts to promote friendly ties with countries like Iran that are located in the global energy heartland would go a long way in protecting India's long term economic and strategic interests.

Iran is only 500 miles away from India by the sea route. As a gateway to Central Asia, friendship with Iran will help India in gaining access to Central Asian resources as well as markets. Moreover, there is a striking convergence of interests between India and Iran about handling Pakistan sponsored terrorism. Pakistan's alleged support to Taliban in Afghanistan and the activities of Taliban backed militants in Kashmir have adversely affected the security interests of both countries. Under these circumstances, India and Iran can build new bonds in their pursuit of fighting cross-border terrorism.

Like Iran, post-apartheid South Africa with its key mineral resources, size of market and strategic location on the Indian Ocean is another major country with which India needs to build an economic partnership. In fact trade between the two countries has already increased. In substance, the Indian Ocean region, its littoral states and their capacities to generate resources would determine India's economic performance. Hence, the proposal to build an integrated policy

3. Prakash Hebalkar, 'Open up the internal market', *Business India*, 8-21 November 1993, pp. 149-50.

4. See the interview with Admiral Vishnu Bhagwat in *The Hindu*, 2 October 1998.

towards the Indian Ocean, accepted by the prime minister in 1997, needs to be immediately implemented. Such a policy would provide a viable basis to invest in the navy.

In addition to a maritime perspective, India, as a pioneer member of the Non Aligned Movement (NAM) can take the initiative in mobilizing NAM as a forum to promote the developmental objectives of member countries. Admittedly NAM is far from being a homogeneous entity, yet it can tackle some of the common economic problems of its members. For instance, problems such as the stabilization of prices of primary commodities, the transfer of technologies, credit, loans and aid to developing countries on favorable terms, and the prevention of environmental degradation in the Third World could be handled if NAM members make a concerted effort to resolve them.

**T**he NAM has to acquire an economic orientation to provide space for the initiation of a North-South dialogue as well as South-South cooperation. After the Pretoria summit of 1998 NAM is gradually acquiring an economic thrust. By being an active participant in NAM, India would not merely strengthen such forums but gain support of its members, in turn, to deal with major powers, forces and international regimes.

In tune with these policies at the global level, India can respond to the process of globalization at the regional level. In fact, India's policy towards its South Asian neighbours has a two-fold relevance. First, any worthwhile project of promoting regional cooperation is inconceivable without India's active participation because South Asia is predominantly an Indo-centric region. Second, as a corollary, it is only by consolidating cooperative ties with its neighbours

that India can contain secessionist movements, cross-border terrorism and diverse range of intra-state conflicts within its frontiers.

**T**he Gujral doctrine which believed in following a policy of non reciprocity towards the neighbouring states proved to be a good device in furthering a cooperative ambience in South Asia. Certain important developments between 1996-98, such as the 30 year treaty between India and Bangladesh over the sharing of Ganga waters, the Mahakali river treaty between India and Nepal and India's initiative to support road links between Nepal and Bangladesh illustrate this. Furthermore, India took constructive measures to promote intra-regional trade by supporting the idea of a South Asian Preferential Trade Area (SAPTA). It offered concessions on 500 consumer goods to the least developed countries and thereby supported countries like Bangladesh in their trade ventures. India also signed an investment protection and promotion agreement with Sri Lanka in January 1997.

Apart from offering financial assistance to Sri Lanka to rectify its trade imbalance, the Gujral regime unilaterally reduced tariff and removed all non-tariff barriers on 70-80 products exported from Sri Lanka to India. In line with the Gujral doctrine, India took the bold step of removing quantitative restrictions on 2000 commodities to promote SAPTA during the July 1998 summit of SAARC held in Colombo.

Although trade and cooperation among the South Asian countries is almost negligible compared to regional organizations in the developed countries, it is with the growing networks of cooperative ties that South Asian countries can tackle their developmental goals. However, organizations like SAARC are constrained to

function under the shadow of a conflictive relationship between India and Pakistan.

Indeed, Kashmir continues to be a perennial bone of contention between India and Pakistan. In order to gain possession of Kashmir, Pakistan has resorted to sponsoring cross border terrorism, mobilizing international forums and striking a military rapport with powerful states like the US and China. India, in turn, is bent on defending its control over the strategically important state of Kashmir while serving its vital national interests.

**B**ut in the process of controlling the flow of drugs and arms, as also the activities of the terrorist outfits in Kashmir, India is constrained to deploy its scarce resources for security purposes. In fact, India had to constantly counter the challenge of secessionism in the North-East, Punjab and Kashmir since the eighties. The gravity of such secessionist threats could be minimized through dialogue with Pakistan on the one hand, and by initiating diverse cooperative ventures between India and its neighbours, especially Pakistan, on the other.

To conclude, India can encounter the phase of globalization by constantly consolidating the phase of reforms and promoting trade related growth. This would subsume a revival of the relationship with Russia as well as forging of new ties with emerging regional organizations like the EU. Also, an integrated policy towards the Indian Ocean would help India build new economic partnerships apart from bolstering its energy security. However, it needs to be underlined that in order to deal with international relations under globalization more effectively, India will have to undertake initiatives to enhance the prospects of South Asian regional cooperation.

# Evolving consensus

I.K. Gujral interviewed by Nandan Unnikrishnan

*In a recent lecture you spoke of a need for a paradigm shift in development strategies among Asian countries, about the distribution of resources and noted that several leaders stressed that development has been vertical and not horizontal.*

There was an interesting meeting convened by the UNDP in South Korea. Thirty nations participated from Asia and the Asia-Pacific. Interestingly, this is an area largely in the grip of an economic recession. Be it Thailand, Korea, Malaysia or Indonesia, you can even include Japan in that and then jump over to Russia, you find a new situation. Why is it happening? For quite some time now the World Bank and the IMF have been formulating policies and advocating the concept of globalisation. Almost every party, every country, has been pushed into that paradigm. The results have caused concern; even the President of the World Bank has now said that it needs rethinking.

The main issue before us is what we mean by development. Until now we have been made to believe that GDP and growth rates determine everything. It goes to the credit of UNDP that for a few years now it has been focusing on human development and therefore has been talking of different paradigms – poverty alleviation, school education, housing, availability of drinking water and so on. A consensus prevails that the course we have been following is not conducive to the general well-being or happiness of the people as a whole. I know that it is not easy to move away from the free market paradigm because of vested interests to whom the market is both king and god.

*You just mentioned globalisation as an issue that has dominated the discussions of the past decade. But the problem we face is that the priorities for India or Malaysia, Central Asia or Eastern Europe may be different. How do you make all this homogenous?*

No, priorities are not different, that's the point. The reverse is true. The IMF and the World Bank have been trying to harmonise that and they have instru-

ments for doing it. But every country has a different ethos, every country faces different social situations. So, therefore, let's not try to harmonise. Let us try to understand and make policies and instead cut the cloth according to our needs, not ask the bodies to fit into the coat.

*How do you see India fitting into this concept of globalisation and where do we go from here?*

I'll go slightly beyond India. When the World Bank and IMF were set up, the general idea was that they would be instruments for the transfer of resources from the developed to the developing countries. It is now beyond doubt that the reverse is happening. The moment you free the market, the moment you open up the transfer of resources, you suddenly find money moving out. Japan is witnessing the same thing now. If India has to an extent been saved, it is because of our conservative outlook and our cautiousness. I'm not saying we should not modernize our economy; I am all for it. At the same time I think we did the right thing by not opening up capital account convertibility, although there has been immense pressure for doing so.

Similarly, when you globalise your stock exchange market. On the face of it, it looks attractive because people come and buy shares. They don't buy shares because they want to help you, they buy shares because the market rises. But the moment the market falls they are the first to sell and get out. The money goes out because we do not have a cooling period.

*But in what direction? What do you think should be done? Should we pull away from globalisation?*

Kindly keep one thing in mind. It is not whether we should do this or that; we must put our heads together, first internally. What is the social scene? What is happening to the poverty sector? After 50 years of freedom, we have to ask ourselves this question. Of course, we are happy that we have been able to create a sizeable middle class. Its estimates vary – some people think that 30-35% of the population has entered the middle class. It's a wonderful thing. And I hear that with

joy. At the same time, any responsible person has to think of those 60-65% people who are not a part of the middle class. How do we transport them into the middle class? And now an estimate is also being made about how many people in India are still left in destitution, not poverty. I mean, I draw a line between destitution and poverty.

Another thing is that the middle class is a very good institution. Generally it helps stabilize society. But one also has to guard against the risks and the danger that it corners the entire benefits. If more money is spent on car manufacturing, less is spent on mass transport. These are the difficulties that we are confronted with. The present situation or the present working system of globalisation has not given all-round satisfaction.

*Is there a breakdown of consensus on foreign policy in India?*

The issue is basically related to the nuclear tests. Just this morning we had a meeting of the consultative committee with the prime minister in the chair. This question was raised and it links with, for instance, my refusal to sign the CTBT. What did I do at that time? Before going public I consulted every political party, and not just once. As the debate progressed the world over, the present prime minister was consulted more often than anybody else. Not only did I consult formally, I shared documents with him and on quite a few occasions I modified my stance to carry the nation with me.

Let us forget for a minute whether the present nuclear policy is good or bad. That can be examined separately but I think if you recall the last parliamentary debate, it was clear that the entire nation was not going along with it. It was a matter of concern. It is a matter of concern that no effort is being made even now. Why is it not done? My general suspicion is that party credit is more important than national credit. Once you get into that mode of thinking, then difficulties arise. Every foreign policy is the foreign policy of a nation and not of a party. Second, if you take an attitude that foreign policy is predominantly the policy of a party then after a few years your policy may change. Continuity will collapse, and if I may put it squarely, neither your friends nor your foes will know when you are going to change your stance.

India's strength has been one of continuity and this has been achieved because of consensus. Jawaharlal Nehru must be given credit for this. You may recall that in his days every public meeting, be it in a village or in town, would be conducted by him as a

study circle. That was a legacy from the freedom struggle itself, because the freedom struggle had left a legacy of consensus. Once we part from that the nation will become weaker and not stronger.

*Now that the nuclear tests have been conducted, what should be done?*

Talks are going on between the government and the Americans but they are covered in a shroud of silence. One does not know what they are discussing. I can understand they cannot make it public. But I cannot understand why they do not tell anyone of us. Even when the tests were conducted, I am not saying it as a complaint, though I was in charge a couple of weeks earlier, I learnt about it on TV. They didn't even have the courtesy of informing us, leave alone sharing it. I can understand you cannot tell before the test. I see no reason why the PM did not share the information after the tests. Everywhere I have said, let us not discuss the tests, let us discuss nuclear policy because, after all, the test is a child of a nuclear policy. Why did India have to do it? We all know the answer and in all humility, I think the government of India is sleeping.

*Well, there is another problem and that is the economic recession in the country. Do you think this in any sense is affecting our diplomatic manoeuvrability at this stage when we are engaged in talks with the United States and have restarted negotiations with Pakistan on several issues?*

The main point is that there is, to an extent, resistance to talks from outside. Only last week I was in Tokyo. Ever since the tests the Japanese government has refused to talk to India. I think I was the first Indian whom their PM, foreign minister and finance minister met. That was breaking of the ice. This wasn't a compliment to me. Therefore, I wouldn't try to present it that way. But I think effort has to be made, preferably by enlarging the track two approach, so that you are able to talk to the people, the newspapers, the editors, to go out and talk to politicians. The difficulty of the present situation is that the government of India has not tried to create a consensus here. The manpower at its disposal is limited. It only wants to send two or three persons who are in its close circle. I have all respect for them. But the effectiveness gets reduced. Therefore, there are not many people in India, who really know, on a personal basis, many people outside.

*Isn't that also true of most governments? To an extent is this not part of the system of political patronage?*

No, it is not political patronage. When I requested A.B. Vajpayee to go to every UN session, or when Narasimha Rao sent him to the human rights conference or when Narasimha Rao sent me to various places, we were presenting the united face of India. That is how India should work; that has been India's style.

*Well, talking of presenting a united face to the world, we saw the Gujral doctrine at work in the neighbourhood during your time as foreign minister and subsequently as PM. The BJP came into power and appears to be moving away from that policy. Recently, the talks have restarted between India and Pakistan. Do you anticipate substantial progress in this process?*

The Gujral doctrine that you talk of—remove my name from it if it bothers you—was a neighbourhood policy of the post-Cold War era when India has to think in terms of the region. Every major country is thinking in terms of its region—the European Union or ASEAN. Only after making a place in this region first can we really take off. So my neighbourhood policy, like every foreign policy, had self-interest in mind. India can play a big role in the world, if our neighbours go with us, and they were earlier. Of course, there was some difficulty with Bangladesh for 30 years, but we were able to resolve it. So also with Nepal: We were able to win back the confidence of Sri Lanka, and we had broken ice with Pakistan.

I don't say we had arrived somewhere. The long history of India and Pakistan is full of difficulties. We must not expect quick results. I am happy that we are talking to each other. This by itself is a good thing. And therefore, whether this round succeeds, or the next round succeeds, or whether the 20th round succeeds, we must go on talking patiently. India-Pakistan relations will never be an event, they are more a process.

*How do you see our relations with the US and China?*

China is our neighbour, so let me start with that. We had some difficulties with China. The '62 war and all that... I think we have once again engaged each other. After several rounds of talks, our borders are now more tranquil than in the past. We both have reduced our arms strength on the borders. Of late, after the tests, there have been some difficulties, but I hope we will quickly get over them.

You see, two things can never be changed: neither history nor geography. We are neighbours for all times to come. And therefore we can be of help to each other. There are several things which are positive in China, their rate of growth has been much faster than

ours. But there are several things that are strong in India. The participation of the people, the entrepreneurial class which we call the middle class. These are very strong points for us. I think we will quickly get over this hiccup in India-China relations and find the same path on which we were proceeding. As for Pakistan, I don't think anybody in Pakistan believes that animosity with India is good for them. Nor do we. I think people have better sense, and given their faith in the region, SAARC is a very important institution for the future. I think our relations with Pakistan and other neighbours will improve a great deal as we lay greater emphasis on SAARC.

*Sir, you mentioned China and Pakistan, but what about the United States—how do you see our relationship today?*

Our relationship with the United States had improved in the past. There have been some difficulties on nuclear policy. But I think that we both understand each other's dilemmas.

*Do you think we will succeed in persuading the world to adjust to a nuclear India?*

Yes, provided we persist with what we are saying and what we are saying is that we want a de-nuclearised world, we want no nuclear weapons anywhere and we believe that. We must also say and repeat that we do not want proliferation. Proliferation has been done by those who've signed the NPT, not by us. India's record on that has been very good. Never hesitate from getting into discussions and conferences. The world is willing to listen.

*What do you think is the most significant event of 1998 and what do you think is the most important priority for India, as also for the world, in 1999?*

1999 will be the threshold of the next millennium. When we met in Korea, the agenda was how do we view the next millennium. I will not repeat what I've already told you. So we said let us do two things from here. One, call a similar meeting of all the political parties and state chief ministers as also all the leaders to find a shared view of the next millennium. Second, in May next year, we will receive the report on human development in South Asia. We've all agreed that a conference of South Asian countries be called to unitedly spell a vision for the new millennium. When we have to carry a nation with us then this is the only way, that together we spell out our vision. We all have our own views, but let us state them openly and see what comes of it.

# Framework for the future

SATISH KUMAR

INDIA, after 50 years of independence and despite acquiring the status of a *de facto* nuclear weapon state, cannot claim to be a power of any consequence. Its achievements have not had their due impact. Much of the explanation lies in a lack of requisite economic growth, social disunity and political instability. But the absence of an imaginative leadership and lack of a structure of decision-making based on essential inputs and expertise also accounts for the drift in foreign policy.

The end of the Cold War changed India's geopolitical environment, as also of most other major nations of the world. The collapse of the Soviet Union was a major blow in terms of both diplomatic and strategic support. The space vacated by the Soviet Union was sought to be filled by China, both in the region as well as on the global stage. China had meanwhile established itself as a power with a pre-eminent economic status in the last quarter of the 20th century. The United States which emerged as the sole superpower from the Cold War

therefore thought it necessary to woo China so that it could play the role of a yes-man in the Security Council, and also help perpetuate the N-5 nuclear hegemony in the world.

This configuration of a weak Russia and a more confident China, willing to collude with the United States was hardly conducive to Indian interests. The result was the gradual evolution of highly constrictive international regimes. India had already shown lack of direction through its totally confused attitude during the Gulf war of 1991. But the global conference on environment and development which took place in Rio de Janeiro in 1992, and the Uruguay Round of trade negotiations which ended in Marrakesh in 1994, totally exposed the weakness of India and its likes. (On these environmental and trade issues, China too was on the losing side.)

However, the culmination of American efforts to create an international system which would perpetuate its dominance along with its allies, and

deny opportunities of growth to other emerging powers, was an indefinite extension of the Non Proliferation Treaty (NPT) in 1995 and the adoption of the Comprehensive Test Ban Treaty (CTBT) in 1996. Both these developments took place because of the connivance of the United Kingdom and France and the collusion of the Russian Federation and China with the United States. A large number of middle powers in Asia, Africa and Latin America endorsed these western initiatives either because they were cajoled to do so or because they thought their economic and strategic interests would be best served by not opposing the United States.

**W**hile the global environment that took shape in the first five years after the Cold War was suffocating, the developments in the neighbourhood too were not encouraging. Pakistan, under the cover of its nuclear weapon capability which it had acquired with China's help by January 1987, launched a proxy war in Kashmir in 1988-89. The United States, which knew that Pakistan had acquired a nuclear weapon capability, invoked the Pressler Amendment to deny economic and military aid to Pakistan only in 1990, after Soviet troops had withdrawn from Afghanistan in 1989. After a brief period of indifference, the United States again found itself supporting Pakistan when Pakistan's Inter-Services Intelligence (ISI) launched the Taliban militia in Afghanistan in 1994.

At stake was access to Central Asia whose gas and oil pipelines needed alternative routes to the South, East and West. But the combined help of Pakistan, Saudi Arabia and the United States enabled the Taliban militia to make rapid strides and capture the entire territory of Afghanistan upto Mazar-e-Sharif by August 1998.

The consolidation of a fundamentalist Islamic regime in Afghanistan was bad enough for India, but its ominous implications became visible when the number of militants of Afghani origin in Kashmir suddenly increased in 1998.

Central Asia had been a zone of friendship within the generally friendly perimeters of the Soviet Union. The break-up of the Soviet Union exposed this region to strategic pressures from the West. India enjoyed tremendous residual goodwill in this region from the days of the Soviet Union. Despite initial overtures from the leaders of Central Asia, India failed to translate this goodwill into concrete economic and strategic relationships. This space was gradually filled by the West and to some extent by China. But the cultural and religious vacuum created by the exit of Russia became an open invitation to the fundamentalist influences from the South. Wahhabism has been recognized as the most potent threat to the sufi and secular traditions of this region. The success of the Taliban militia in Afghanistan only lends credibility to this threat. In the process, it creates an additional obstacle to the pursuit of Indian objectives in this region.

**L**astly, in this survey of India's strategic environment since the end of the Cold War, one may refer to the state of the Non Aligned Movement (NAM). This movement served as an anchor for major countries of the South to project their interests in the global fora where they were disadvantaged vis-à-vis the North. The gradual inroads made into the power structures of these countries of the South by wealthy countries of the North shook the foundations of South-South unity. Since 1989, most of the leaders of the South were in a case at their wits end as to how to redefine their role

in the post-Cold War world. Their capitulation came when in 1995 they acceded to an indefinite extension of the NPT, and in 1996 on signing the dotted line with regard to the CTBT. Therefore, when India faced the NAM summit in Durban in September 1998, the sailing was rough, whether it was on the question of Kashmir or the nuclear tests of May 1998.

**W**hen India conducted its nuclear tests on 11 and 13 May 1998, it was at once an act of defiance and fulfillment. It was a defiance of the international community which had imposed a hostile regime on India intended to curb its natural potential. It was the fulfillment of a national dream about which a consensus had developed in the previous three years. Irrespective of the immediate political motives of the Bharatiya Janata Party (BJP), the ruling party at the centre which took the decision, the nation reacted with a sense of pride and renewed confidence. The pride flowed from the demonstration of technological capability. The confidence emanated from the ability to take on its adversaries.

Unfortunately, however, the political leadership of the country did not rise to the occasion. After the subdued euphoria of the first few days, the leaders of political parties other than the ruling party started wobbling. Most of them reacted to this momentous event in partisan terms. And this despite the fact that it was only the left parties which were opposed to nuclear tests on grounds of principle. The ruling party on its part failed to devise a mechanism of consulting other parties on how to develop a post-nuclear national response. Nor did it utilize the abundant non-official expertise in projecting India's position abroad.

The result was that the country found itself divided and on the defensive on the most vital issue of national

security. Given the extent of defiance, it was natural for the status-quoist powers to condemn India. But if India had responded more unitedly and decisively, the condemnation would have lost much of its edge. The political leadership thus failed the nation.

The failure of political leadership to give direction was more critically evident in shaping a response to the demand for signing the CTBT. On this issue, though, the ruling party deserved blame. Its own lack of experience and expertise was compounded by an absence of a viable decision-making structure. And yet, the ruling party could have helped matters if it had kept consultations with key figures in other political parties and not allowed too many voices to speak on the subject on behalf of the government.

**I**n world politics today, neither alignment nor non-alignment are dominant features of national behaviour. International relations between every two major nations are conducted on the basis of mutuality of interests. In most cases, they run on two parallel tracks of conflict and cooperation. Either of the two tracks could acquire salience in a given situation when juxtaposed with relations with a third nation. The process is often described as engagement, as against indifference, isolation, or prolonged hostility.

India has to pursue a policy of 'engagement' with all major nations of the world. But there must be a framework, a sense of direction within which this policy should be pursued. The direction would be provided by a set of objectives. The foremost objective of Indian foreign policy in the 21st century should be to contribute to the evolution of a multipolar world. A secondary objective should be to strive towards the creation of a democratic world order. While India's relations

with major powers like the Russian Federation, China, the United States, and the other members of the power cluster called the G-8, would have to be conducted in accordance with these two objectives, India's relations with its neighbours would have to be governed in pursuit of the third objective, namely, safeguarding Indian security. And the maximization of India's economic interests in a globalized world should constitute the fourth objective. These objectives are not mutually exclusive. They overlap and intermesh. In fact, the first two are subservient to the last two.

**I**n pursuit of the first objective, i.e., the creation of a multipolar world, it is necessary for India to pay special attention to its relations with the Russian Federation. Geopolitically speaking, Russia is India's most obvious strategic partner. In the past, India has benefited greatly from Russia's diplomatic support, and its contribution to India's defence build-up to the extent of 70 per cent or more of its total capability. After the Cold War, even though there was a short period of mutual indifference between the two countries, their cooperation in the field of defence has been significantly increased. And yet, cultural and political exchanges are nowhere near the level they used to be during the Cold War days.

There is also a need for continuous and vigorous interaction in economic and technological fields. Russia, despite the retreat of communism, is a value-oriented power. Unlike the United States it does not conduct international relations only to seek economic or strategic advantages. Despite its temporary economic disarray, it has the potential to checkmate American aggressiveness, or resist American military pressures in any part of the world. India, therefore,

must do everything possible to boost Russia's stature in the world. Russia must remain as one of the pillars of a multipolar world.

Next to Russia, China has the potential to checkmate America's hegemonistic tendencies and thereby contribute to the evolution of a multipolar world. India's relations with China have been on the upswing ever since Prime Minister Rajiv Gandhi's visit to Beijing in December 1988. Even if the progress in normalization of relations, particularly on the boundary question, has been slow, there must be a realization on both sides that improvement is of mutual interest. The setback caused by India's nuclear tests was to be expected, regardless of when the tests took place. Before the tests, China refused to consider India as worthy of talking to on the nuclear question. After the tests, hopefully, sooner or later, China will agree to talk to India on confidence building measures in the nuclear field.

**T**here is considerable commonality of interests between India and China on global issues pertaining to trade and environment. So far there has been regular dialogue between the two countries only on bilateral issues. It would be useful for India to involve China in a dialogue on trade and environmental issues on an ongoing basis. China will continue to oppose India's recognition as a nuclear weapon power in terms of the NPT and India being given a permanent seat in the Security Council. China will also continue to help build Pakistan's military capability, both nuclear and conventional. But, none of these should restrain India from a continuing dialogue with China on bilateral as well as global issues.

The third major power with which India must maintain good relations is the United States. The United

States is not only the most powerful country but also India's largest trade partner and investor. The United States evokes admiration and anger in equal measure in most countries of the world. India is no exception. In the long run, all would like to do business with it.

**S**ince World War II, the United States has tried to prevent the rise of new powers. Now it is India's turn to be at the receiving end. The Indo-US dialogue which started after India's nuclear tests and has gone through five rounds or so is a process by which the United States is getting acclimatised to India's new status. India has some inherent advantages which cannot be ignored. Its large market with a 300 million purchasing class, its vast investment potential as an emerging economic power, and its democracy run on the basis of the rule of law, are assets which a commercially minded nation like the United States would value.

It would therefore be advisable for India to maintain considerable resilience in its dialogue with the United States. Whether it is the Comprehensive Test Ban Treaty, or the Fissile Material Cut-off Treaty, or the deployment of nuclear weapons, there is no need to yield to American pressures and compromise on India's basic interests. India's principled stand on weapons of mass destruction, that it has the right to possess them to meet its security threats until they are completely eliminated from the world, has met with wide appreciation in non-official American circles. It will ultimately stand the test of time. Meanwhile, there is no substitute for engaging America in the pursuit of those goals where Indo-US interests do not collide.

The next set of objectives pertains to the creation of a democratic

world order. This has been one of India's goals since independence. So far the Non Aligned Movement was supposed to be a major instrument of achieving this goal. For reasons stated earlier, NAM is no longer capable of performing this role. Alignment and non-alignment are no longer meaningful frameworks. Rhetoric, which has been a hallmark of the NAM style, must be replaced by action.

A democratization of the world order necessitates restructuring the composition and procedures of the Security Council and the Bretton Woods institutions. This cannot be brought about by votes in the General Assembly. What is needed is a dispersal of economic and military power which is presently concentrated in the G-8. This can be done by a two-fold strategy. One, regional economic organizations in Asia, Africa and Latin America should be strengthened. Two, they should prepare well for effective bargaining on trade and economic issues in organizations like the WTO (World Trade Organization). No quick results, however, should be expected in this endeavour.

**S**afeguarding Indian security constitutes the third objective. 'Security' is a comprehensive concept. Here, however, we are concerned with security threats from known external sources, namely, China and Pakistan. The question of China has been dealt with earlier. Brief comments on Pakistan, Afghanistan and Central Asia are called for.

War between India and Pakistan is completely ruled out, particularly after the nuclear tests of May 1998. Options for the resolution of Indo-Pak disputes, whether on Kashmir or other issues, are therefore severely limited. This is well realized in Pakistan as well. A recourse to dialogue is unavoidable. The so-called composite

dialogue held between the two countries in October-November 1998 was not entirely without gains. This was the first such exercise after the nuclear tests.

Pakistan needs time to put its own house in order and develop a national consensus on rapprochement with India. That is why even the limited gains in the dialogue on trade and economic cooperation were not publicly admitted by the Pakistani delegation. The significance of the nuclear tests has yet to sink into the Pakistani psyche. Pakistani decision-makers still want to prove the point that India-Pakistan disputes cannot be resolved without third party mediation. Therefore, while being watchful, India must exercise patience with Pakistan and continue the dialogue.

**I**ndia has been without any influence or role in Afghanistan ever since 1979. The recent victory of the Taliban militia over more than 90 per cent of Afghanistan's territory has overwhelmingly negative implications for India. One of the abject failures or lapses of Indian policy was illustrated by the fact that even when Mazar-e-Sharif was temporarily captured by the Taliban in May 1997, India, along with Iran, Russia, and the Central Asian states of Uzbekistan and Tajikistan did not do enough to checkmate their subsequent advance. India is facing the consequence of inaction in the form of Afghani militants in Kashmir.

Whether the Taliban phenomenon in Afghanistan is reversible is doubtful. What is, however, possible is to build fortifications against its influence in Central Asia. The leadership of all the five states in Central Asia is extremely wary of the destabilizing effect that any Taliban advance would have on the whole

region. So far, Russia is the only outside country willing to make common cause with it. But Russia's role would be confined to providing military support in terms of the Tashkent Treaty of May 1992.

India, on the other hand, has a strong ideological affinity with Central Asia. This affinity is focused on safeguarding and strengthening the age-old sufi and secular tradition of the region. India has pursued this objective through sporadic intellectual interaction, but what was needed was a pervasive Indian economic presence. There was also tremendous scope for India's help in the field of education, particularly in the primary and secondary sectors. Unfortunately, however, India's capacity to exercise influence in this strategic hinterland has been constrained by a lack of strategy and will. Even now, India would do well to target economically weak areas which are specially amenable to fundamentalist influence, like the Ferghana valley, and play a role in their development.

Lastly, there is the objective of maximizing India's economic interests which is largely a function of domestic policy, both political and economic. And yet, foreign policy is a major instrument of economic growth. Foreign policy plays this role in two ways. First, by working to create favourable international economic regimes through multilateral institutions, and second, by getting the best one-to-one deals through bilateral talks. Specific strategies in both respects have been discussed earlier and need no elaboration.

One may conclude by stating the obvious. Foreign policy can enhance domestic strength but cannot be treated as a scapegoat for domestic weakness. A good foreign policy can have a multiplier effect. A bad domestic policy can only lead to ridicule and rejection.

## Rethinking the fundamentals

K. SHANKAR BAJPAI

AN examination of issues, such as this publication has undertaken, are of value primarily to the extent that they indicate ways of future improvement. The past is a useful teacher up to a point and therefore needs looking at, but it is even more necessary to get back to the basics of what foreign policy implies and requires. At the risk of seeming to underestimate the knowledge and understanding of our readership, let us recapitulate a few fundamentals.

The ultimate purpose a country's foreign policy must serve is to enable its peoples to enhance their way of life on their land. This sets up two major objectives: national security and economic betterment; each of which, in turn, has to be sought in accordance with the constraints and compulsions of two other factors: domestic politics and external interactions. The demands of each of these four principal determinants of a sound foreign policy may conflict with each other. During the Cold War, for instance, India's defence requirements called for close cooperation with the USSR, whereas it is at least arguable that our economic progress might have been better through greater cooperation with the West; similarly, the dangers to our territorial integrity

from outside needed far greater military expenditure than our domestic politics seemed to permit. The balancing of such varied and often competing pressures and requirements constitutes the primary task of policy-makers who, moreover can only function effectively if they have and, most importantly, share, an appropriate frame of reference. To understand how India's foreign policy evolved, it is first necessary to understand what frame of reference the leaders of our newly independent country operated within.

**I**n the minds that were brought to bear on the evolution of the newly independent India's international position and relationships, several formative elements jostled for influence. The first was our inwardness. Borobudur and Angkor Wat notwithstanding, we have been isolationist throughout history. *Jambu Dwipa* may originally have had cosmological significance but it also reflects our self-definition as an island cut off from all other lands. Even when independent India has been roaming the world as a great activist, our greatest desire has been to be left alone.

Our experience of subjugation gave rise to three equally powerful tendencies: anti-colonialism, a profound aversion to power politics, and the insistence that only the right to think things out for oneself could give us complete independence. Mistrust of western powers was nurtured by the first two of these (along with fears of economic imperialism and neo colonialism) while in the third lay the seeds of non-alignment.

Another major influence arose from the nature of our nationalist movement, specifically the teachings of Gandhi and the appeal of non violence. This led us from the view that power-politics is evil, to an abhorrence

of power itself. Again and again, our leaders of that time spoke out against both as the cause of international conflict. And since power was largely seen as military force, we deprecated the latter as an instrument for ourselves. (Though not articulated openly, the apprehension of a man on horseback surely reinforced this attitude, along with the supposition that expenditure on defence would come in the way of economic growth.)

Nor should we fail to note the role of socialism. In the decades preceding our independence its appeal was world-wide, more so to a colonised people whose principal friends and advocates were to be found among socialists. Apart from its theoretical attractiveness; Marxism was seen as the enemy of imperialism, and had the added value of providing cut and dried analyses of world developments to people inexperienced in such matters – a complete frame of reference in itself.

**N**ot least, every Indian had looked forward to independence as releasing our capabilities. The belief that our long-suppressed energies, talents and viewpoints could at last operate on the world stage, encouraged a conviction that India had something new to offer in determining the interaction between states and the evolution of a new world. This was further encouraged by the coincidental ending of the Second World War and the creation of the United Nations, when not only in India but the world over a spirit of idealism, of hope for an international order based on peace and justice flickered for a while. On the other hand, as we looked at the world around us for the first time through our own eyes, what loomed largest on its horizons was the threat of yet another major conflagration, containing among all its terrible consequences the destruc-

tion of all our hopes for rapid economic development

**O**ther circumstances in which we became independent provided additional inputs into our earliest attitudes. The greatest influence came from the fact of Partition. For generations we had been told by our colonial masters that India was too marked by differences of race, religion, language and so on to be able to remain one state once we lost the cementing force which colonial rule had provided. Our nationalist movement, whatever the strands that constituted it, with the obvious exception of the Muslim separatists, challenged this as an imperialist divide-and-rule device.

We claimed fervently that we were all brothers who would become even more united left to ourselves, but it is hardly in doubt that deep down there was a profound unease, the awful fear that however sincerely we believed in our unity, however genuinely we rejected the British arguments to the contrary, there might after all be enough to them to require particular attentiveness to the maintenance of our unity. This underlying apprehension was to manifest itself most significantly in the domestic arrangements we went in for with their emphasis on an over-mighty Centre, but it also influenced greatly our approach to foreign affairs.

Partition not only strengthened our unspoken and, in the atmosphere of those times, unspeakable fears regarding our unity, it brought with it the still continuing problem of Kashmir, the immediate effect of which was to make our leaders turn to the one instrument of state policy which they most denounced. The need for our military forces became quickly evident when the fledgling government had to cope with the massacres and migrations accompanying Partition.

Its deployment in Junagadh, and more extensively in Hyderabad, were essentially police actions, but Kashmir soon became a virtual war, reinforcing both the need for our army and its reputation. Still, to our new leaders it seemed that military expenditure was contrary to our international pacificism, harmful to our economic development and, above all, dangerous for democracy.

**T**his ambivalence about the role of armed force in the exercise of state power was to become even more complex as time passed: the 1962 fiasco with China finally forced recognition of the need for a strong military force, but old hesitations about the role of the military in our polity or our policy-making prevented the development of any mechanisms or systems for making strategic military thinking a part of governmental planning (while, oddly enough, our governments became increasingly prone to rely on armed force for the management of even domestic problems). The point of significance was that our leaders hoped to produce a method of handling India's external relations in which military capability was at a discount.

All this, then, provided the inputs that determined our attitude to the world, our sense of India's place in it and of the contribution we should make to it: an overwhelming concentration on India as a world unto itself; inexperience in dealing with the world as it combined with a profound mistrust of it; a particular suspicion of the only part of it that had entered our consciousness, namely the West; a predilection for socialism and therefore a hope, if not an established sense, of affinity with those elements in the world – writers and thinkers, political parties or states and government – in whom we saw a fellow-feeling; the belief that the world needed a new

message and that India could provide it; a special sense of mission in working with other victims of colonialism to end it; fear of militarism in general and of the armed confrontation developing in the world into which we had emerged, countering which was a high priority; above all the longing to be left alone to advance our economy and consolidate our Indian identity.

After half a century, how differently do we approach the very different world we have to deal with? Can it be objectively said that our frame of reference has evolved, either to discard the inaccurate and the irrelevant or to take account of what is new or appropriate? Consider just one point: since the end of the Cold War, the most repeated platitude has been that now the prime determinant of foreign policy is economics. Is there any noticeable evidence that we actually put this theory into practice? Some might say our entire liberalisation idea was such an attempt (or, as the more ideologically minded put it, we are selling out to the West), but in fact it is the inhibitions about liberalisation that show how once again the domestic situation is limiting the adaptations and new directions needed in foreign policy.

**C**onsider energy. Nothing is more vital to our future, to our survival no less than to our progress. In what ways is our foreign policy being allowed to optimise our energy supplies for the coming decades? Our handling of this, more precisely our dithering about it, illustrates perhaps the most significant change in our approach to foreign policy: instead of becoming more practical, purposeful or adept, we have become increasingly subject to inexperience and uncertainty.

India's political evolution has been one of the marvels of history. Going rapidly through the democra-

tisation which took generations elsewhere, we have empowered the hitherto excluded elements of society to the greater long-term stability of our polity and society. The inevitable price is the ascendancy of parochial and ever more inward-looking considerations in policy-making.

**W**e have greatly expanded our defence systems and capabilities, but this does not betoken any increase in our comprehension of how the world works or how we should deal with it. It is indeed an example of our failure to improve our practice of statecraft. We have let problems reach a point where no solution is possible without at least an initial use of force. This is most evident in our domestic life but is also an underlying weakness in our approach to international affairs. The real role of power in the world is something we have yet to come to terms with. Military strength is certainly an essential element, but as we always emphasise that too depends ultimately on economic power; what we seem not to recognise is that anticipation, pre-emption, persuasion, ideas are all also crucial to the application of influence which is part of the use of power.

Which brings us to yet another aspect of India's behaviour vital to any comprehension of its motivation: the things we did or did not do, or the ways in which we did them, were determined not only by the elements that went into our frame of reference but by our habits of living and dealing with each other. The former shape a country's foreign policy, the latter its diplomacy. There is much confusion about these terms, almost as though they are interchangeable. India's media commentators, who were to become the most outspoken critics of how India handled its external relations, frequently poured scorn on our mistaken foreign policy when what

they actually talked about were failures of diplomacy.

Broadly speaking, diplomacy is to foreign policy what tactics are to strategy, the attempts to give effect on the ground to the goals and routes thereto worked out by headquarters. If our foreign policy was worked out within the ideas, experiences and attitudes prevailing in our policy-making centres, our diplomacy was immensely conditioned by the ways we Indians behave 'on the ground.' And the key point is that we are not exactly at ease in dealing with each other, leading to a distinct awkwardness and frequent ham-handedness in dealing with outsiders. Worse still, our press and Parliament have no use for anything less than the most strident and extreme language, forcing us to shed the balanced and measured terms so essential to diplomacy.

It has long been the fashion to blame most of our international drawbacks or set-backs on our professional diplomats. There is room for improvement everywhere but as the principal instrument for our interaction with the world, our foreign service has not lacked either quality or expertise; the problem has been disuse. Nor have we developed the extra-governmental inputs so vital to healthy policy making. With some very impressive exceptions, public discussion of issues involving external relations, most specially strategic but also diplomatic, whether among legislators, academia or the media, reflect an amateurism which is more rather than less evident in government as a whole.

A perfectly valid case can be made that, whatever may be said about the rewards or advantages it has missed in various parts of the world, on the vital objective of national security, India has maintained its interests pretty satisfactorily. Except for the ini-

tial losses to China, and a few square miles in the Rann of Kutch, our territory remains what we say it should be. We have withstood the worst that Pakistan has tried. Regardless of the pros and cons of our nuclear developments, we are in a better position than ever before to protect ourselves, so why the carping?

The submission here is, that is all very well (and full of the debatable), but it does not lessen the main point: we are not only far from having that position in the world which our size, capabilities and talents ought long since to have earned us, we are actually experiencing a diminution of our role and of our potential to serve our interests better. Most of this is due to non-foreign policy factors, but as the survey above was intended to bring out, we are also still largely stuck in the ideas and attitudes of our birth. Indeed in many ways we are even less ready to cope with the world as it is. Both the concepts and the mechanics of our foreign policy need up-dating. That will only come about if we first and foremost base our approaches on two realities: we must develop our self-confidence, and we must come to terms with the role of power in the world.

It passes all understanding why we are constantly afraid of outside forces undermining our independence; if America is not out to subvert us, the multinationals will take us over. Granted that one of the worst legacies of colonisation is being robbed of self-confidence, surely by now we should have recovered. And sad though it is, the world is unfair and unequal: power must exercise itself, and no amount of howling against it will lessen its role. We must learn to live with it and to handle it. The alternative is to be ever less relevant to the world, and to stagnate.

**THE FUTURE OF NUCLEAR WEAPONS: A US-India Dialogue** edited by Victoria L. Farmer.  
Proceedings of a conference held in Philadelphia, 5-8 May 1997. CASI, 1998.

IN the aftermath of India's unexpected nuclear tests of 11 and 13 May this year, Jaswant Singh's paper, written for the Center for the Advanced Study of India-organised conference in May 1997 has more than mere scholarly value. Singh added a postscript in June 1998 after India's tests, and in view of his critical role as the Indian government's chief negotiator on the nuclear issue, including in the ongoing Indo-US talks involving US Deputy Secretary of State Strobe Talbott, his expressed opinions are of particular significance. The CASI dialogue, the second in a series, the first of which was sponsored by the Ministry of External Affairs, was sponsored by the US Department of Energy and the W. Alton Jones Secure Society Program. Participants on both sides included policy-makers and academics working on security issues. Significantly, on the Indian side, scholars with anti-nuclear positions were conspicuous by their absence (with the singular exception of M. V. Ramanna, a post-doctoral fellow at MIT, who was only an observer).

Jaswant Singh's paper was presented in absentia by S.K. Singh, former Foreign Secretary. Singh's paper is notable for its rather unusual reading of Indian

history which many, even of the Sangh combine, would find difficult to accept. He claims, for instance, that 'its [India's] historical tradition was entirely bardic—oral,' really. Later, however, he does concede a 'recorded history' at least 'from 326 BC, when Alexander prevailed over Porus.' But despite these, and other inconsistencies, a 'pro-Hindutva' bias remains.

Thus the Revolt of 1857 is reduced 'to the final overthrow of the Mughal Empire' and 'to the skirmishes of 1857.' This disregarding of the 1857 Revolt, which is not even termed a Sepoy Mutiny, as the colonial British historians dubbed it, is necessitated by Singh's contention that during this period, i.e. from 326 BC to 1857 'India "lost" to waves of aggressors, principally because the notion of the "territory" of an "Indian state" was just not there; nothing, therefore, had to be defended at all costs.' Given Singh's own origins, this latter statement is particularly surprising since the Rajputs, apart from their reputation as relentless fighters, also had the tradition of *jauhar*, when their women committed mass suicide by throwing themselves into pyres rather than risk capture. It is difficult to think of more resolute defence.

Singh's theorization, though in line with RSS theology, is problematic. Though, 'A sense of [Indian] nationhood, predating the evolution of western nation states by many millennia, has certainly existed... Indian statehood has been episodic and only incident-

tal.' Historically, there was 'a failure to evolve an Indian state... [which] became the cause, in turn, of failing to do so even after Independence.' Furthermore, according to Singh, 'that sense of nationhood... in India's case, is in essence non-territorial.' So how did this nationhood exist, without both territory and a state? Purportedly through the existence of an 'Indian civilization... [which was] entirely non-proselytizing.' While such arguments are common enough in RSS inspired circles, they remain unconvincing. If 'patriotism, as an emotion toward the nation, has always been in abundance,' what was its subject, if neither a defined territory or demarcated geographical space, much less an existing state provided the basis for this national loyalty? Moreover, as is well known, pre-feudal India of centuries past was marked by parochial loyalties as the notion of an 'Indian' nation is a modern and relatively recent concept.

Singh's own claims about Indian nationhood are part of his basic argument, that because of an absence of a territory and a state, India has 'no inheritance of strategic thought.' This is also due to the fact that, 'Because of our convictions about honour and chivalry... because of the absence of resolve to finish off the enemy when the opportunity arose, our adversaries routinely got the better of India.' The example of Prithviraj Chauhan's battles against Shahabuddin Ghauri is cited, though history is replete with contrary examples. Ashoka, appalled by the bloody devastation in the war against Kalinga in which thousands of the enemy were 'finished off', turned to Buddhism. But, disregarding all inconvenient history, Singh further claims that 'in the Indian mind, shaped by a forgiving cultural milieu, war has always been regarded as an uncivil and undisciplined activity.' In more modern times, 'Our confusion with Gandhian pacifism, and the lure of the moral tones of nonalignment relegated strategic thinking to an irrelevancy.'

Nowhere does Singh explain how the policy of non-alignment was devoid of any strategic thinking. Didn't the builders of NAM consider it in their national interests to stay clear of the bloc rivalries characteristic of the Cold War? And weren't the principles of Panchsheel enunciated at Bandung explicitly related to perceptions of national security interests? When he concludes that, 'For India, state-centric perceptions, state influence, and sovereign national interests can be the only guideposts of policy,' he is stating nothing new, much less revealing a profound insight. Singh can instead be faulted on his excessive focus on the state, ignoring popular aspirations and interests. In today's

world, it is clear that no state can be sure that it can oppress its own people with impunity with no international intervention. And popular upsurges have shown their capacity to destabilise strongly entrenched states and regimes, as in the former Soviet Union and Indonesia.

But Singh's major problem is nuclear policy. He is very critical of the lack of continued testing and the failure to weaponise after the 1974 nuclear tests: 'Had we straight after conducted a series of other such tests and established clearly our ability, then it would have been easier to cope with all the confusion of subsequent years, and all the other difficulties.' However, in his postscript of 1 June 1998, India's decision to develop its nuclear capability is explained by 'the gradual deterioration of India's security environment, principally on account of nuclear and missile proliferation in its neighbourhood.' Yet, India's becoming a nuclear weapon state is lauded as 'an endowment to the nation, its due, the right of one-sixth of humankind.'

In all this, an analysis of what constitutes India's national security in a changing world order, though promised by the title of the paper, is never even attempted. Though there are stray remarks about economic policy and a longer section about the need for maximising self-sufficiency in energy, there is no attempt to examine non-military aspects of national security. This is as troubling as Singh's excursions into Indian history, as it indicates an approach to national security that is chauvinist, militarist and simplistic.

Any hope that the proceedings of the CASI conference at which this paper was presented would be significantly more informative and profound is quickly belied. C. Raja Mohan, for instance, dismisses much of India's nuclear policy which he terms 'disarmament fundamentalism' as derived from Nehru's 'whims and fancies.' He later suggests that the US recognise India 'as a *de facto* nuclear weapon state... leaving enough room for India to develop a credible deterrent posture as a political insurance against China,' along with the resumption of 'high technology cooperation with New Delhi' which could form the basis both of a nuclear accord with India and 'help build a stable balance of power in Asia.' But as Amitabh Mattoo points out later, a national commitment to devote 'huge resources as well as the long-term political resolve needed to match China's nuclear arsenal' is questionable. He agrees with P.K. Iyengar of the Indian Atomic Energy Commission that, 'India's current policy of strategic ambiguity, by its very opaqueness and uncertainty, does offer an existential deterrent against China.'

For Raja Mohan, as for other Indian advocates of nuclear weapons, since 'The revolution in military affairs, the application of information technology to warfare...is going to substantially strengthen the American lead over all the other powers...for the Chinese, Russians and even Indians, in the long term the value of nuclear weapons is going to be much greater. For them...even to stay in the league of the big boys, nuclear weapons become much more important than they were before.' This encapsulates basic tenets of the nuclearist argument: nuclear weapons are a necessary ingredient of power and thus essential to national security, because of the US's technological lead nuclear weapons would be required for at least as long as one can imagine, since a 'collective security system' necessary for global disarmament 'is very difficult to structure,' and therefore unlikely. Raja Mohan's terminology, e.g., the need for India to stay with the 'big boys', reveals the masculinist and macho ideology behind nuclearism.

To be fair, none of the American participants in the conference offer anti-nuclear or anti-realist arguments. Even if these are not accepted, these should at least be addressed. But that is the greatest failing in this entire discussion. If global disarmament is to be understood as more than an utopian and idealistic goal which the Raja Mohans can deride as 'disarmament fundamentalism', then the fundamental and exceedingly dangerous instability that the spread of nuclear weapons creates needs to be examined. The increasingly recognised and critiqued inadequacies of the dominant realist theory of international relations, as well as of what India as recently as 1995 in its submission to the International Court of Justice called the 'morally abhorrent' theory of nuclear deterrence, need to be widely and comprehensively discussed. But not only are these issues wholly absent in the discourse of current policy-makers, but the obscurantist and chauvinist mindset revealed in Jaswant Singh's paper can only be most disturbing in a nuclear India.

**Kamal Mitra Chenoy**

**INDIA TOWARDS MILLENNIUM** edited by  
P.R. Chari. Manohar, Delhi, 1998.

THE evaluation, in a single volume of essays, of India's performance as a functioning democracy over the past half a century of Independence is a daunting task. In fact, Padmanabha Ranganatha Chari, retired IAS officer turned academic, who has edited these

dozen wide ranging articles himself admits in his concluding remarks: 'It is clearly impossible to reach definitive conclusions on so complex and encyclopaedic a question as India's record over the last fifty years.' Yet, the attempt is a creditable one, for it is more than necessary to ruminate the past to prognosticate what the future holds for the country as it moves towards a new millennium.

Much like India's balance sheet over the past five decades, the book too is a mixed bag. There are at least two outstanding contributions from T.C.A. Ramanuchari on the Constitution and G.K. Arora on the bureaucracy. Prem Shankar Jha, B.G. Verghese and P.V. Indiresan chip in with useful insights on the looming economic crisis, the education mess and the technology backlog. But the sections on political parties, foreign policy and security, culture and gender disappoint, lacking the perceptive sweep of the other essays.

Ramanuchari argues with great perspicacity in his paper on the Constitution the need to liberate the guiding principles of independent India from the gross and often willful misinterpretation that has led to its present distortion. He quotes Heidegger to stress the importance of stepping back right to the beginning to reveal the 'noble vision' of the Constitution which sought to secure and protect a social order in which justice would prevail in all institutions of national life. Rejecting the recent tendency to blame the inadequacy of existing constitutional provisions as well as proposals to make fanciful changes, Ramanuchari makes a compelling case of giving the Constitution a fair trial in its true spirit.

In sharp contrast Arora, in his ruthless dissection of the Indian bureaucracy, questions the very foundational beliefs of the civil service. He argues that the demystification of the bureaucrat's colonial image as the supreme public protector is the only way out and adds that because of new emerging political structures like panchayati raj, the process may already have started. 'Once the halo of the keeper of the keys of the kingdom is withdrawn from the members of the canonical order and the burden of the territorial imperative placed firmly on the heads of the elected representatives, it is possible to consider new beginnings,' asserts Arora. He maintains that once the question of who has the power is out of the way, it would become easier to reorganise the bureaucracy according to the needs of modern India.

Jha laments the wasted promise of India becoming an industrial power, laying the blame on the inability of successive governments to adapt to a fast changing world economy and raising fears that

the country may well become a victim rather than a beneficiary of globalisation. Verghese points to the fundamental mistake in education policy of indiscriminately subsidising higher education as 'development' and treating primary education as 'welfare' which could wait. And, in his chapter looking back at 50 years of Indian technology, Indiresan gives example after example of how because of its own folly, the country repeatedly surrendered its technological advantages which could have been exploited in the global jungle.

Significantly, many of the essays trace the causes of the present crisis of the Indian state to mistakes made in the formative years of the Republic rather than to the more obvious misdemeanours by recent regimes. This belies the fashionable tendency these days among the chattering classes to lay the entire blame at the door of the present political class and bureaucracy. The book, therefore, is a timely reminder that the way out of the tunnel for India lies in making seminal changes instead of chasing after surface disorders arising out of an original malaise.

It is a pity, however, that some of the contributions are inconsistent with the high standards set by the rest in the volume. Khare, for instance, in his treatise on politics sums up the history of political parties but fails to adequately address the crucial paradox raised by Arora in his paper on how democracy, while bringing politics closer to the people, has made democratic government more and more difficult. Subrahmanyam's standard nuclear panacea to the security threat and the truisms on a proactive foreign policy by Gonsalves are far too simplistic a response to the complex power equations in the neighbourhood and elsewhere in an unipolar world. The normally eloquent Butalia is surprisingly subdued on the status of women while Vyas, after turning his back on the consumerist middle class, pointedly refuses to analyse the mushrooming pop filmi culture engulfing city and village alike. A major gap in the book is the absence of a separate piece on the judiciary, particularly since the editor himself concludes that the one-word mantra needed to make India united, strong and viable is none other than justice.

**Ajoy Bose**

**DEVELOPMENT, ETHNICITY AND HUMAN RIGHTS IN SOUTH ASIA** by Ross Mallick. Sage Publications, New Delhi, 1998.

Ross Mallick is angry with the scholarship on South Asia, particularly as it reaches the international com-

munity. He finds it inaccurate, selective and self-serving in its use and interpretation of information.

Mallick's ire is particularly directed at the West Bengal Left Front government, and those whom he sees as holding a brief for it, pointing repeatedly and accusingly at Atul Kohli and Thomas Nossiter. His two earlier publications, *Development Policy of a Communist Government: West Bengal Since 1977* (1993) and *Indian Communism: Opposition, Collaboration and Institutionalisation* (1994), explain his preoccupation. His judgment that there is little to laud in the West Bengal communist government which did not 'confront the rural elite' and actually promoted their class interest, which not only did not effect a 'redistribution of assets... through land redistribution or at least by progressive agricultural taxation,' but pursued elite landed class interest (p. 101) pervades his treatment of this subject.

In his castigation of extant scholarship, Mallick repeatedly adverts to funding imperatives controlling research agendas, a factor that is of serious concern in Indian scholarship, widely acknowledged and discussed in informal arenas but which has perhaps not yet been taken head on. Then there is the bias of the elite scholar to elite positions. There is also the whitewashing of the subaltern, where the voices of the subaltern subject is restructured into the language and context of the elite. He refers to subtle and not so subtle 'threats of torture and requests for bribe' (p. 285) which are used as a means of influencing scholars. His indictment of scholarship which 'sanitises in a way that permits return access and ensures academic kudos' (p. 50) is depressing. It is difficult to deny that these are legitimate concerns which the academic community needs to confront.

Perhaps Mallick's identity as a 'development consultant' makes him reserve mere impatience for foreign aid agencies, and leads him to suggest, time after time, that western aid should be linked to human rights and the treatment of minorities. For him, it is the 'new urban middle class which continues caste practices in private life' and which is 'generally opposed to foreign pressure for human rights implementation' (p. 244). It is perhaps true that there will be few takers for his position that 'international aid can be an important asset in conflict resolution,' particularly when he claims soon after: 'The development programmes of South Asian states provide opportunities for international organisations such as the IMF and World Bank to assist regional organisations in multilateral endeavours' (p. 34).

When, in the context of tribal land alienation, he refers to the Narmada dam project to state: 'Even if

governments choose to ignore the protests, international lending agencies will be pressured to withhold funds by indigenous and international NGOs,' and adds: 'The World Bank's decision to withhold further funding for Narmada points to a new awareness of the adverse effects development can have on tribal peoples,' we know he is speaking only half-truths. His gentleness with aid agencies is evident time and again when; for instance, he finds Sri Lanka having 'utilised foreign aid for ethnic swamping and thereby helped foment a civil war' (p.131).

This attribution of innocence to aid agencies continues when he states that 'though foreign donors inadvertently contributed to the alienation of tribal homelands, the publicity surrounding the Chakma struggle appears to have made the aid community more sensitive to the effects its aid might be having' (p.187). This, even as he refers to tribals in Bangladesh 'being decimated by ethnic cleansing... done with the complicity of western governments and their aid agencies,' and, again, the 'leading cause of tribal displacement during the Pakistan era (in Bangladesh) [being] foreign aid which, as in Sri Lanka, altered the ethnic composition of the local population' (p.181). Severe indentments, even if apparently unintended.

It is the Marichjhapi massacre that Mallick uses to demonstrate the failure of scholarship. In an aggressive assertion, he claims: 'If the massacre is recorded at all it is because I am writing about it now' (p. 288). Let me set it out as Mallick presents it: When the Left Front came to power in West Bengal, one of the biggest problems was the influx of millions of East Bengal refugees. The poorest among them had been forced by the Congress government to settle at Dandakaranya in Madhya Pradesh. The communists had demanded that they be settled in the uninhabited Sundarbans Ganges delta. With the advent of Left Front rule, he refugees 'took them at their word,' sold their belongings in Dandakaranya and returned to West Bengal. A visiting team of parliamentarians, nominated by Morarji Desai to investigate Marichjhapi prior to the eviction that was to lead up to the massacre, found that about 30,000 untouchable refugees who had managed to reach and settle at Marichjhapi had, to quote Mallick, 'by their own efforts... established a viable fishing industry, salt pans, health centres and schools' (p.286).

The state government, however, demanded that they leave the settlement and flung the Forest Act at the settlers, Sundarbans being a reserve forest. 'When persuasion failed to make the refugees abandon their

settlement, on 26 January 1979 the West Bengal government started an economic blockade of the settlement with 30 police launches. The community was teargassed, huts razed and fisheries and tube-wells destroyed in an attempt to deprive them of food and water. The Calcutta High Court ordered a lifting of the blockade, but this was ignored.... When these police actions failed to persuade the untouchable refugees to leave, the state government ordered the forcible evacuation of the refugees which took place from 14 to 16 May 1970.... Several hundred men, women and children were said to have been killed in the operation and their bodies dumped in the river. Photographs were published in the *Anand Bazar Patrika*' (p. 287).

The Marichjhapi file at the Scheduled Caste and Scheduled Tribe Commission contained a list with the names and ages of 236 men, women and children killed by the police at Marichjhapi prior to the massacre. The refugees told visiting MPs that a thousand of them had died of disease and starvation during the occupation and blockade. And an article in *The Oppressed Indian*, in July 1982, cites that 'of the 14,388 families who deserted, 10,260 families returned to their previous places... and the remaining 4128 families perished in transit, died of starvation, exhaustion, and many were killed in Kashipur, Kumirmari, and Marichjhapi firings' (pp. 287-288).

Yet, no criminal charges were brought against any of those involved in the action. No investigation was undertaken. The SC and ST Commission in its annual report recorded that there were no atrocities against the untouchables in West Bengal. And scholarly writing pretended that it had never happened.

It appears there was one more episode to complete this sordid event: once the forest had been cleared of the refugees, 'the CPM settled its own supporters in Marichjhapi, occupying and utilising the facilities left behind by the evicted refugees. The need for environmental preservation and compliance with the Forest Act were forgotten' (p. 288).

The fading away of memories of such gross violations is a perpetual danger, particularly where there is a diversifying of arenas and incidents which create victims of violence. Perhaps a meticulous documenting of such violence has become an imperative, not only out of respect for the victims but also to provide the background for locating a counter to such violence.

Ross Mallick's judgement that the untouchables are the 'last segregated group in the world outlasting South African apartheid' (pp. 57 and 233) may seem a bit too optimistic about the state of other subordi-

nated peoples of the world. Similarly, there may not be too many takers for his position that 'apartheid has disappeared in South Africa' even when one may agree that it is 'rampant in India' (p. 261). Perhaps it is that he finds the comparison useful to explain the Indian elite's resistance to 'subaltern emancipation', and to the absence of any self-doubt in the Indian elite's 'divine right to rule' (p. 261). In any event, his analysis that 'colonial strategy, despite its limitations, was more conducive to the political emancipation of untouchables than was the Congress policy of cooption,' (p. 236) may deserve scrutiny. So too his caution that the 'differential impact of colonialism on subaltern emancipation needs to be recognised for the opportunities it provided rather than being condemned according to the nationalist agenda of scholars' (p. 236).

The image of ethnic swamping in the Sri Lankan experience with the Mahaweli irrigation scheme to which he refers (p. 131), is reinforced by his reference to the construction of the Kaptai dam in Bangladesh which flooded 40% of the cultivable lands (p. 182), even as it displaced 96,000 tribals and 'altered the ethnic composition of the local population' (p. 181). It leaves one wondering what the dispossession and displacement of tribals, done in the name of the panacea called 'development', means in the Indian context.

Mallick relies on select case studies from Sri Lanka, Bangladesh, Pakistan and India in his analysis of ethnicity, human rights and, to an extent, development. In the process, it must be said, a diversity of persons, groups and institution and a complexity of issues which are now everyday fare – militancy and state action, repressive laws, liberalisation, the judiciary and bonded labour are only examples – in the human rights and development debate get hardly a passing mention.

**Usha Ramanathan**

**INTERNAL CONFLICTS IN SOUTH ASIA** edited by Kumar Rupesinghe and Khawar Mumtaz. Sage Publications, New Delhi, 1996.

DURING the last five decades, many policy as well as political changes have taken place in South Asian countries. The degree and intensity of violence and unrest has escalated dramatically, particularly in the last decade. Long-running conflicts within these countries became more deeply entrenched while new conflicts arose. As a result, these societies have faced an upsurge

of ethnic violence, communal tensions, militant activities, misuse of political powers, insecurity and criminality. Thus, the South Asian region has been marked by different kinds of internal conflicts. At a time when SAARC has completed over a decade of its existence and ways and means are increasingly being discussed to widen the area of regional cooperation, this book provides appropriate and timely pointers towards resolving the problems of internal disorders.

The edited book under review analyses a wide range of issues relating to the development of internal conflicts in the South Asian region and attempts to identify the possibilities for transforming and resolving them into peaceful solutions. The book contains a comprehensive introduction and four articles on Pakistan's military bureaucracy, fundamentalism, militarization of civil society and the gender dimension in Sindh's ethnic conflict; three chapters on India's civilization, politics of violence and politicization of Hindu women; a paper on Sri Lanka's militarization and violent society; and one on Bangladesh's democratization process. Besides the above country-specific articles, there are two regional papers relating to ethnic conflict and strategies for resolving them.

The Pakistan specific articles are primarily related to growing terrorism, indiscipline and fragmentation of society. Akmal Hussain in 'The Dynamics of Power: Militancy, Bureaucracy and the People' examines the relative powers of the military, political personalities and Pakistani population. He analyses the distorted economic performance marked by slow economic growth, mounting foreign debt, continued aid dependence and the increasing fragmentation of civil society resulting from the widespread availability of surplus arms from the Afghan war, the growth of heroin trade and an erosion of the state's monopoly on violence. The author has foregrounded the growing power of the Pakistani military relative to the bureaucracy and its bearing on country's political life.

Abbas Rashid in his paper, 'Pakistan: The Politics of Fundamentalism', observes that the resurgence of Islam in Pakistan can be traced to the fundamentalist Islamic schools and their traditionalist intellectual framework. A new era of state-sponsored fundamentalism was introduced by General Zia when he came to power in 1977 and the subsequent promulgation of constitutional changes. To counter the strong influence of Islamic fundamentalism on the Government of Pakistan, the author suggests the reinsertion of rationalists and humanists into the mainstream of Islamic thought such that indigenous and authentic liberatory

forces could address the country's democratic and development needs.

Shireen M. Mazari in ' Militarism and the Militarization of Pakistan's Civil Society: 1977-1990' focuses on the impact of the martial law instituted in the regime of General Zia, the consequent militarization of Pakistani society and the resurgence of Pakistan's military which was especially pronounced after the liberation of Bangladesh in 1971. The overflow of arms and drugs resulting from the Afghan war further compounded the ethnic, sectarian and king-ship cleavages in society.

The final article on Pakistan relates to the gender gap in Pakistani politics, particularly in Sindh. The role of women in political and ethnic causes and the participation of women in the Sindhi nationalist movement are dealt with in the article, 'The Gender Dimension in Sindhi's Ethnic Conflict' by Khawar Mumtaz. By providing historical information and other details about the Sindhi nationalist groups the author pleads for bridging the gender gap. She observes that the participation and involvement of women in the national movement has been mostly determined by the male leadership. In sum, this paper mainly focuses on the repressive measures depriving women of what were seen as their established rights and their support to the ethnic-national cause.

The book presents differing views regarding Indian society, the state and women. Dev Nathan in his paper, 'India: From Civilization to Nations', argues in favour of a Marxist proposition ensuring the right to secession for the minorities within India, while advocating a more democratic society. Sumanta Banerjee traces internal violence, secessionism, terrorism, insurgency, electoral violence and Hindu-Muslim conflicts to the inequitable distribution of wealth and regional imbalance. In his article, 'The Politics of Violence in the Indian State and Society', Banerjee argues that nationalist terrorist groups are seeking to establish autocratic theocracies in some states, especially J&K and Punjab and have been targeting state authorities, left leaders and religious moderates. The author rightly points out: 'The language of the gun is thus becoming a decisive force in political discourse in India in states like Kashmir.' The assassination of Indira Gandhi and the subsequent massacre of Sikhs in New Delhi, the killing of Rajiv Gandhi and other such incidents highlight the general culture of violence that marks Indian society today.

Another factor fanning the flames of communal violence is the criminalisation of politics. According

to Banerjee, two options are left for Indian society – disintegration or dialogue, accommodation and the evolution of a new model for society. He advocates the controversial proposal made in 1973 by the Sikh Shiromani Akali Dal about the restructuring of the Indian state, confining the central government's responsibility to defence, currency, foreign relations and communications.

The Hindu right wing groups – the RSS, Vishwa Hindu Parishad and the Bharatiya Janata Party – are targeted by Tanika Sarkar in her paper, 'Hindu Women: Politicisation Through Communalism' which describes the mobilization of women with a conservative background. These groupings advocate empowerment of women through a learning of martial arts, ostensibly aimed as self-defence and to counter the violence of dowry murders and physical harassment by husbands, but simultaneously primes them for a war against Muslims. This training prepares Hindu women for citizenship in an authoritarian Hindu state.

Meghana Guhathakurta's paper, 'Democratization in Bangladesh: The Mass Uprising of 1990 and its Aftermath', focuses on the transfer of political power from the military to elected parliamentarians and its impact on Bangladesh society. She observes that a combination of political and student unrest, a decelerating economy, the conditionalities imposed by international aid donors following the disintegration of the Soviet Union were the reasons for the downfall of President Ershad and the transfer of power to a caretaker government.

The paper on Sri Lanka's internal conflict, 'Militarization, Violent State, Violent Society: Sri Lanka' by Jayadeva Uyangoda delineates the conflicts between the state and the LTTE and the resultant violence due to the excessive operations of legislature, executive and judiciary of the state. Apart from the state's operations, 'informal' agencies too created violence through different *modus operandi*. He highlights the mutual reinforcement between violence and ethnic essentialism. Given the vicious cycle of violence and ethnicity, the author is pessimistic about the possibility of a democratic solution.

The article, 'Ethnic Conflict: Rethinking the Fundamentals' by Kumar David argues that ethnicity lies at the core of many of the internal conflicts in India and elsewhere. He points out that larger national units enjoy an edge over smaller countries in organising their resources to achieve better economic production. Smaller units find it difficult to attain the full development of human potential. The author suggests a two-

pronged approach to handle the negative aspects of ethno-politics: a commitment to oppose racial and religious oppressions as well as oppressive regimes and social orders, and a commitment to a new world order and a new universal human consciousness.

Kumar Rupesinghe's essay on 'Strategies for Conflict Resolution: The Case of South Asia' looks at the entire region and offers possible options for resolving conflicts. After carefully scrutinizing the powers of state, sovereignty and the nature of conflicts – interstate, authority, ideological, identity and resource-based – the author presents some suggestions to mitigate the internal conflicts of the region. A greater degree of autonomy for minorities, fundamental social reforms and the establishment of political and constitutional democracy are some broad suggestions.

Rupesinghe opines that a rationalist formula may not always work out in all phases of conflicts. In support he points to the potential of the Sangha as a mediator of anti-Tamil violence. The experience of peace groups in the Philippines and their role in 'zones of peace'; peasant groups in Columbia and their methods of dialogue with guerrillas and government forces are highlighted as possible strategies. Convinced by the preventive and peace maintaining experience of the European Union and the evolving capacity of the Organization for Security and Cooperation in Europe for dispute resolution, the author suggests that South Asia borrow elements of the above strategy.

Overall, the book provides a summary account of internal conflicts created by government, military, militants and political functionaries in the societies of South Asian countries. The editors' introduction which weaves the major strands of all the articles, adds to the merit of the book. It provides a compact yet comprehensive account of the multi-faceted internal conflicts of the region.

The contributors to this volume argue forcefully in favour of a violence-free and tension-free society. However, Kumar Rupesinghe's suggestion to borrow strategies from Europe to resolve the internal problems of South Asia may not be suitable in the regional context of SAARC. Likewise, Sumanta Banerjee's recommendation to revisit the controversial 1973 proposal made by the Sikh Shiromani Akali Dal to restructure the Indian state is questionable, as it could lead to the fragmentation of Indian society and polity. Often, the discussions are repetitive, perhaps due to the similar problems faced by all countries. Had the papers either been arranged thematically or country-wise, it would have added to clarity. Nevertheless, the book deserves

attention as an important contribution towards understanding the problem.

**T. Nirmala Devi**

**INDIA'S NUCLEAR DETERRENT: Pokhran II and Beyond** edited by Amitabh Mattoo. Har-Anand Publications, New Delhi, 1998.

THERE is a problem with 'instant books' on a subject making headlines. Its immediacy makes for saleability but erodes its shelf life. But the editor of India's Nuclear Deterrent, Amitabh Mattoo, felt that it was necessary to urgently call in academic contributions on the implications of a nuclear India. 'India's nuclear policy was too important to be left to the judgement of civil servants and politicians,' he writes.

But do the essays in the book, written by some of the better known experts on the country's nuclear discourse, go beyond a sophisticated restructuring of today's journalistic comments? Do they provide a more enduring and prescient framework for an in-depth analysis for tomorrow as well as today? Mattoo's objective in the study is to interrogate 'five essentials'. (i) Was the decision to test and weaponise taken by a weak government out of tune with public opinion? (ii) Does China really pose a strategic challenge to India? (iii) Is deterrence stable in South Asia? (iv) Will US economic sanctions have an impact on India's nuclear policy? (v) Can India still play a meaningful role in the movement for nuclear disarmament?

Somewhere in between the impressive modelling of force structures of an Indian nuclear deterrent in these essays, gets misplaced the basic question: Do nuclear weapons enhance the security of the Indian people? The public opinion surveys marshalled by Mattoo (and imaginatively juxtaposed with the surveys done after the 1974 explosion) relate the nuclear issue with national self-esteem and international status which cuts across partisan lines. At the popular level, the emphasis is less on strategic ramifications than on scientific achievement. But for most strategists the one credible *raison atomique* is China, compounded by the Pak-China entente and the US ambivalence towards CIA intelligence on China's transfer of technology to Pakistan. Mattoo laments that even after the finger wagging at China in the context of the tests there has been no meaningful debate on the China threat. This, he argues, is largely because of a lack of Indian expertise on China.

This lack of expertise is reflected in the noticeable absence of references to Indian scholarship or

Indian intelligence sources in the construction of the Chinese threat. Two contradictory 'foreign' assessments of China are set out – one the liberal institutionalist, which privileges accommodative to offensive strategies and the other, a 'realist' reading of Chinese culture which stresses offensive coercive strategies. The realist view holds sway. But Vġai K. Nair's analysis of the China threat in the 'The Structure of Indian Deterrent' is a tired recitation of the Ministry of Defence's annual report without full stops and quotation marks. George Fernandes' assertions about the Chinese threat are laid out but not examined. Instead there are throw away assertions like: 'The stonewalling tactics being employed by the Chinese indicate that they have no desire to resolve the Sino-Indian territorial dispute' or, 'This is clearly illustrated by the number of planned incursions along the LAC in 1997,' demonstrating the use of political carrot to maintain and consolidate the *status quo* 'and its military stick to remind the Indian political leadership that the territorial dispute remains unresolved.'

Kanti Bajpai, turning over the same facts, favours the liberal interpretation. India, he claims, does not figure in China's threat cosmology. China is a 'satisfied power' and the status quo on the border favours China. Its claims on Sikkim and Arunachal are of tactical use. Bajpai notes that the 1980s crisis over Sumdorong Chu and Operation Chequerboard were not allowed to disrupt the dialogue, thus demonstrating the importance both attach to normalisation. He might have also mentioned China discontinuing its support for separatist insurgents in the North East.

Disappointingly, the analysis of the China *raison atomique* does not go beyond picking up the popularly accepted assumptions in the polarised discourse on China. Nair admits that the Indian leadership needs to analyse what Chinese interest is facilitated by their assistance to Pakistan. It is a pity that none of these essays attempts a serious or imaginative interrogation of the China threat.

Where the essays creatively break new ground is in the modelling of strategic deterrent structures for India. Evidently, the forte of the contributors chosen is strategic studies, with only subsidiary foreign policy concerns. Picking up one end of India's nuclear policy spectrum, that is a 'maximalist deterrent', is Bharat Karnad's combative essay, 'A Thermuclear Deterrent'. Karnad seeks to counter the drift towards an unexamined 'minimum deterrence' outline becoming state policy by default. At the other end is Kanti Bajpai's persuasive 'The Fallacy of a Nuclear

Deterrent' which challenges pervading nuclear fatalism and puts back on the agenda the nuclear 'renunciation option' driven not by 'moral objections' but because there are other security pathways which eschew nuclear weapons.

Karnad sets his sights on a nuclear deterrent which will achieve for India 'strategic independence'. Rejecting estimates of a minimal deterrence structure of 60 odd nuclear weapons as suggested by K. Subrahmanyam, Karnad models a full and robust nuclear deterrence structure of 300 plus, as fitting of a middle power. Its cost would be around Rs 60,000 crores, affordable at 1/42 of today's GNP. Thermonuclear weapons would ensure for the first time 'absolute security'. A multi-megaton thermonuclear weapon is not much more expensive to produce than a fission weapon. A small arsenal of nuclear weapons based on low accuracy missiles with a high CEP will not make for a credible Indian nuclear deterrent. Drawing upon the international *gurus* of the nuclear deterrence discourse, Karnad argues for a maximalist deterrence structure since deterrence, ultimately, is a mind game played in peace time to compel obedience and not to exert influence in a military conflict. Consequently there is to be no signing of CTBT or FMCT till the capacity to build 1000 weapons warheads is reached. And in the end, Karnad argues, it is the momentum of high technology research which propels nuclear testing and weaponisation programmes.

Karnad delinks the probable structure of an Indian nuclear deterrent from a specific threat, especially from a nuclear Pakistan. India's strategic and threat compass includes many other sources of insecurity. Quoting the Indian government's assertion about nuclear weapons as a strategic (out of the area) deterrent, he rules out the use of nuclear weapons in the Indo Pakistan theatre. 'In the South Asian context, the use of nuclear weapons is tactical use which the Indian government has wisely forsworn,' i.e., no first use. Karnad dismisses the western propensity to draw up nuclear conflagration scenarios in South Asia and argues that the same restraint that India and Pakistan have shown in their conventional wars is likely to be paralleled in their responsible handling of nuclear weapons. As a firebreak he suggests that there should be no nuclear arming of the Prithvi missile.

In contrast Nair constructs a Pakistan specific, an almost 'tactical' nuclear deterrent structure targeting counter value and counter force targets. No mention is made of the probability of a fallout on neighbouring India. Weapons capability *vis-à-vis* Pakistan is to

destroy it as a socio-economic entity and vis-à-vis China is to generate dangerous imbalances between that country and her primary adversaries – USA? A recommended force structure is an aggregate of 132 weapons of different types deployed on SSBNs and IRBMs.

Kanti Bajpai draws up an audit on India having a survivable second strike and concludes that in the near and medium term there are numerous gaps which cannot be overcome. That is, it does not have the ability to reply to a large first strike by China. Even if India was able to put in place a credible retaliatory deterrent, Bajpai argues that military stability – zero possibility of attack – would not be assured. This was demonstrated in the chilling ‘near misses’ of a nuclear confrontation between the US and the USSR. Bajpai picks up the various moments in history where deterrence has failed to prevent a conventional conflict breaking out between asymmetric nuclear forces (China-USSR) or conventional and nuclear (Vietnam and China). Moreover nuclear weapons may positively encourage conflict below nuclear and all-out conventional war threshold, e.g. Pakistan’s support for insurgency in Kashmir. Much of it, though, is ground covered by Bajpai in earlier writings.

Analysing how deterrence in South Asia could fail, Bajpai examines how the classic security dilemma, i.e., the inability to distinguish between strategic offence and defence is the kind of dynamic which was in evidence in Operation Brasstacks-Zarb-e Momin crisis. More recently, is the example of Pakistan raising the alarm that India is threatening a first strike in May 1998. In all these ‘crises’, Pakistan raised the spectre of nuclear weapons largely to internationalise the issue. However, as Bajpai presciently warns, ‘Pakistan’s flair for the dangerous reveals a deep seated fear about the larger neighbour and that this psychological state could lead it into potentially catastrophic decisions.’

As in any collection of essays, the quality varies. But R. Ramachandran’s analysis of the scientific dimension carries the authority of his long standing study of the subject when he asserts that ‘data from five tests would seem to be of limited value to design a battery of highly sophisticated weapons. But these should suffice for weaponisation based on a few basic designs and to maintain the professed minimum deterrent.’

Mattoo’s collection of essays is likely to be highly sought after as a ‘ready reckoner’. It makes accessible in one place all you wanted to know about possible nuclear deterrent structures, the scientific dimension, impact of sanctions and the technology export control

regime. It will make for a more informed debate on an Indian nuclear deterrent.

Rita Manchanda

**WHAT CONSTITUTES NATIONAL SECURITY IN A CHANGING WORLD ORDER? India’s Strategic Thought** by Jaswant Singh. CASI Occasional Paper No. 6, 1998.

**ACROSS BORDERS: Fifty Years of India’s Foreign Policy** by J.N. Dixit. Picus Books, New Delhi, 1998.

**INDIA’S FOREIGN POLICY, 1947-92: Shadow and Substance** by Harish Kapur. Sage Publications, New Delhi, 1994.

**ETHNICITY, SECURITY, AND SEPARATISM IN INDIA** by Maya Chadda. Columbia University Press, New York, 1993.

HOW has India done in the world? How has it handled its relations with other countries? Fifty years after Independence and nearly a decade after the end of the Cold War seems a good time to reflect on Indian foreign policy. The four authors under review – one a serving politician, an ex-diplomat and two NRI academics – obviously thought so as well.

What are the main elements of Indian foreign policy? Is there a pattern? Over fifty years, how has this policy performed? Can one say, on balance, that free India’s policies towards other countries have been a success? Jaswant Singh, J.N. Dixit, Harish Kapur and Maya Chadda offer varying opinions on these basic questions. The conventional view today is that Indian foreign policy has been more or less a failure, that the Nehruvian policy has ill-served India. And it has failed because it was woolly headed and idealistic and shunned strategic thinking and power politics. Is this correct?

A crude answer emerges from reading these four recent assessments. Perhaps not surprisingly, Jaswant Singh of the BJP is of the ‘India has failed’ school. Dixit, by contrast, thinks that Indian foreign policy on balance has been successful. Harish Kapur and Maya Chadda stand somewhere in between Jaswant Singh and Dixit. Kapur is almost agnostic in his assessment, but overall the reader is left with the impression that, while India had done alright in its foreign relations, there has been a decline in the country’s international involvement and in the extent to which it is able to shape

international events. Chadda thinks India was most successful in managing a regional policy during the early years, with Nehru at the helm, but with growing centralization of decision-making since Nehru and increasing doubts about the impartiality of the central government in dealing with ethnic claims, Indian policy has become more problematic.

Jaswant Singh's monograph on India's strategic thought is interesting for at least three reasons: first, the author is a senior politician with the ruling BJP; second, he is responsible for the ongoing India-US dialogue after Pokhran II, and his thoughts on the subject of strategy may well be affecting this vital realm of foreign policy; and third, he takes a broad and thematic view of India's relations with the outside world. A key conclusion of the monograph is that India's way of dealing with others has been a failure, historically and over the past fifty years or so.

Jaswant Singh argues a familiar case, namely, that India's failure to deal with others advantageously comes from its lack of strategic thinking. Singh's monograph attempts to do several things, but most interestingly it tries to show why India lacks a strategic tradition. According to him, a series of 'absences' are responsible for India's parlous condition: Indian civilization is non-proselytizing; India has never had a 'functional' and 'assertive' state; its sense of nationhood is 'episodic' and 'incidental'; the country has never known anything but military reverses and 'servitude'; its people do not have a written history; the 'fixity' of India's historical imagination does not let it see the past as a living inspiration; there is confusion about national identity; Gandhian pacifism has befuddled Indian society; the 'moral tones' of non-alignment have made strategic thought irrelevant; Indians do not have the right 'character, attitude, and approach' to war; they have failed to develop the idea that territory had to be defended at all costs; they have suffered under the delusion that foreigners would fight in the same way they did; honour, chivalry, or absence of ruthlessness did not allow Indians to finish off their opponents (rather like the Indian cricket team!); and Indians have cultivated a 'habitual disinterest' in the broader issues relating to national security.

This is quite an indictment, coming as it does from a leader of a party which wants us to be proud about India, about being Indian (*garve se kaho*), and about buying Indian (*swadeshi*)! If this is the Hindutva view of India, there is not much to be proud of. Is India as bad as Jaswant Singh would have us believe? Is our history replete with such colossal failures?

Clearly J.N. Dixit, India's foreign secretary until 1993, does not think so. Across Borders is his latest book. It is redolent of his seminar interventions and his previous writings, touching on themes, ideas, predilections, prescriptions, incidents, and periods that one associates with this most public of former foreign secretaries. However, this is not a repackaging of his earlier books which touched on his ambassadorial term in Sri Lanka and on relations with Pakistan. It is a descriptive and analytical survey of Indian foreign policy since Independence, and therefore sits somewhere between a superior if fact-ridden textbook and a more rigorous, critical weighing of the formulation, direction, successes and failures of India's relations with the world.

Dixit argues that, on balance, India's foreign policy has been a success. The basically Nehruvian principles and vision that have undergirded, with some inflections and adaptations, our relations with the rest of the world have advanced our interests, kept the peace more or less, and made us some enduring friends. In this day and age of Nehru-bashing, this is not a particularly fashionable conclusion. Perhaps Dixit's assessment arises from the conceit of an insider, someone whose professional life was dedicated to the prosecution of a basically Nehruvian policy. But I think we must grant that Dixit is far too self-conscious and honest to be caught in the trap of self-delusion and self-congratulation.

A second and related conclusion is Dixit's rating of his political bosses: in other words, who was a successful practitioner of the art of diplomacy and who was not? Not one to mince words, Dixit rates the Nehru family and Lal Bahadur Shastri high. P.V. Narasimha Rao, as both foreign minister and prime minister gets a good credit rating. Chandra Shekhar in his brief sojourn as prime minister gets a tick mark or two of approval. Atal Behari Vajpayee as foreign minister in 1977-79 also merits Dixit's approval. But V.P. Singh and I.K. Gujral do badly in Dixit's estimation: they failed to come to grips with the end of the Soviet Union; V.P. Singh mishandled Kashmir (particularly the Rubaiya Sayeed kidnapping) and Sri Lanka; and Gujral got nowhere with the 'Gujral Doctrine'. This would be mere gossip, in a sense, except that, as Dixit points out, Singh and Gujral led, or rather misled, Indian foreign policy at a transformative moment.

Dixit is not uncritical of the Indian record. Interestingly, India's China policy comes in for some stick. Thus, he suggests that India should go beyond a 'historical, emotional, and purely technical' approach to

the border problem; it should compromise, with an eye to the strategic interests of both sides; it should accept that colonial boundary delineations are not binding and that compromise plus new cartographic and legal methods of resolving the dispute exist; it should also continue with the CBM approach initiated in the 1990s; and finally, it should educate public opinion on the need for, and nature of, a final settlement.

Dixit is also refreshingly blunt on India's handling of what he describes as two 'poignant' issues which had a negative impact on its foreign relations: Babri Masjid and Kashmir. He accuses the government of the day of mishandling the Babri issue. Dixit reveals that he urged the Cabinet Secretary, S. Rajagopal, 'to move... security forces to the actual site [of the mosque] to prevent any untoward developments.' Rajagopal for 'reasons best known to him, hesitated from conveying this categorical advice' (p. 230). He is even more critical on Kashmir. The government's Kashmir policy was 'tragedy bordering on farce' (p. 231). Institutional incoherence, personal rivalries, bad governance, lack of consensus among parties and the public – all these have contributed to the disaster. Force has its limits; India must acknowledge its mishandling of Kashmiri alienation if it is to restore peace and tranquillity to this troubled state – not new admittedly, but boldly said for a former official.

Harish Kapur's *India's Foreign Policy* is, like Dixit's book, a survey. Kapur's conclusion is that India has over fifty years striven to achieve four goals in which foreign policy has played a vital role: national security, economic modernization, regional hegemony, and international prestige and involvement. Personalities count, and so India's leaders have dealt with these issues in different ways and with varying degrees of success. In a judgement that is rather close to Dixit's, Kapur rates Nehru, Shastri, Indira Gandhi, Rajiv Gandhi, and Rao as the best in dealing with India's external challenges. Desai, Charan Singh, V.P. Singh and Chandra Shekhar did less well, in part because they paid international issues much less attention.

On balance, Kapur seems to suggest that India has done well enough in terms of its foreign policy. New Delhi has 'adapted' to changing realities in the four areas. That said, there are serious challenges ahead. National security increasingly involves attention to domestic troubles, a point that is made by all four writers. In addition, South Asia is beset by turbulence. Nearby regions too are unstable. China is a growing threat by virtue of its growing power. The loss of the Soviet Union as a bulwark and ally has made India more

vulnerable internationally. In respect of modernization, India has to come to terms with globalization. Globalization is an opportunity and India must take advantage of it. But its domestic and international consequences will be far reaching for India. India's desire for regional hegemony has been stymied. It has not been recognized as the leader of South Asia by its regional neighbours or by powerful outsiders. If India wants to attain greater influence in the region, it must pursue a strategy of accommodation and cooperation. Finally, India's internationalist role has been diminishing steadily since the heady days of Nehru and is now firmly regionalist rather than globalist. India's global role is basically limited by regional and domestic instabilities and preoccupations. Kapur concludes with the judgement that Indian foreign policy is marked more and more by reactivity rather than 'voluntarism', and it is ever more sensitive to domestic factors.

Maya Chadda's *Ethnicity, Security and Separatism in India* focuses on India's regional policy and the domestic roots of its policy. She notes that one view of India is that it is basically a hegemonic-minded power in South Asia. A contrary view is that India is basically a defensive, *status quo* power in respect of the region. Chadda argues that neither view is correct. A third and more accurate view comes from looking at the overlap between domestic and regional policy. Nation building and international relations must be seen in one framework because that is in effect how decision makers in developing countries have to deal with social reality. In particular, ethnic fragmentation and the stresses and strains arising from it in post-colonial societies spill over into neighbouring countries.

South Asia is no exception. India is beset by its own ethnic troubles and is simultaneously at the centre of ethnic spillovers from its neighbours. And the pressures that result have led India to adopt a regional policy which is neither hegemonic or defensive. It is a policy, instead, which is sophisticated and managerial for the most part and relies on 'relational control' and 'interlocking balances'. Relational control is the ability to affect not only outcomes but relations of convergence and conflict which produce outcomes. Relational control allows for interlocking balances of interests between centralising state authority and sub-nationalities. It also allows policy-makers to fashion an external balance, to adjust relations with neighbours who may be tempted to interfere in India's domestic ethnic conflicts. Relational control involves the use of persuasion, coercion, sanctions and force to produce an internal and external balance.

Two kinds of interlocking balances have been at the core of India's regional policy. The first balance is between idea of the historic state of India which is imagined as united and coherent and the idea of the modern state of India which is imagined as pluralistic but under a universalistic and rational central authority that, essentially, allows differences to be accommodated. Policy-makers have to reconcile these two, often contending visions of India. The second balance requires 'accommodation of conflicting claims to legislative power, public offices, and popular votes', what Chadda calls the 'traditional stuff of politics'. It is in this realm that interlocking balance is actually exercised through acts of 'representation and co-optation, coercion or persuasion.' To the extent that New Delhi fears that these balances are unravelling and that outsiders can take advantage of it, Indian policy-makers are forced to cultivate power and influence over the neighbourhood. This is mistaken as hegemonism.

What conclusions can one draw about Indian foreign policy based on these four works? First, India's policies have been sophisticated and successful, in the main. Obviously, Jaswant Singh differs here. Second, India's early leaders were rather more interested in and adept at foreign policy. This should give us a pause for thought in an era of globalization where India is willy-nilly forced to engage the larger world: we seem to be drawing in at the precise moment when we should be reaching outwards. Third, domestic politics have and will continue to profoundly affect the course of our policies and our ability to deal with outsiders consistently and effectively. Fourth, India faces a variety of challenges to its unity and safety in the years to come. The end of the Cold War may be a comfort to the western powers, but in regions such as South Asia there are dangers ahead. Fifth, and perhaps most importantly, Indian foreign policy is distinctly liberal. By liberal, I mean simply that it repeatedly turns away from an excessively power politics approach. If there is one common assessment and concern among the four authors it is that India cannot and should not run its foreign relations with a narrow focus on Indian interests backed by coercive power. Chadda is the least prescriptive of the four but given what she says about the nature of and need for internal accommodation in India, I think it is fair to suppose that she would support a broadly liberal policy in the external realm as well.

### **A Despotism of Law**

Crime & Justice in Early Colonial India

**Radhika Singha**

This book explores the emergence of colonial criminal law against the backdrop of British conquest and pacification of North India. Criminal justice is examined as an ideological and cultural enterprise in which the East India Company sought to communicate new notions of sovereign right. Central to this was the claim that legitimate violence was the sole prerogative of the state, an assertion which brought colonial law into conflict with the competing claims of religious, patriarchal and patronal authority. While the Company's judicial institutions manoeuvred around caste, rank and patriarchy, they also engaged with various projects of modernity to assert a more transcendent and undivided notion of sovereignty.

## BETWEEN TWO FIRES: Volume 2

Towards an Understanding of Jawaharlal Nehru's Foreign Policy

*Iqbal Singh*

As the Congress party's chief spokesperson on international affairs for two decades before Independence and as India's Foreign Minister for well over a decade and a half after it, Jawaharlal Nehru is, perhaps, the most authentic and convincing expositor of India's foreign policy. This is a meticulously researched and well documented two-volume study towards an understanding of Jawaharlal Nehru's foreign policy. Based on hitherto unused Nehru Papers the author addresses issues that have dodged students of Indian foreign policy and world diplomacy.

## I want to be the last child

ON 6 August 1945 an atomic bomb was dropped on Hiroshima and thus opened a Pandora's box. Even as the horrible era of World War II was coming to an end, another horrible era of nuclear war had begun. Governments have invested enormous resources in the development of compact and effective nuclear weapons for a holocaust, so that their country can be one of the nuclear powers of the world.

A nuclear deterrent makes a country sceptical. The logic of using a nuclear weapon may be gaining ground as large amounts of money have been used to develop it. I don't see any future for human beings as long as we continue to possess nuclear weapons. We are currently living under a threat of nuclear weapons which have the capacity to completely annihilate every form of life, including human beings, from this planet.

'On the day', I, a 14 years old girl, saw a burning hell. The Bomb created a great shock, as if the sun in the sky had dropped on the earth, burning people as if they were flammable rags. Hiroshima, a city of 400,000 people, suddenly turned into a city of death. I can never forget the scenes of 53 years ago, such as the high flames throughout the night, people who all looked like ghosts roaming the streets, the numberless dead bodies, blue smoke from cremation fires and so on. All these scenes make me shudder even today.

Till then I had firmly believed that the war was a crusade to bring about liberation and peace in Asia. On that day, I realized that the war meant nothing but killing people. In the ruins of the town, I clasped many dead bodies telling them: 'You must be suffering with the heat. I too was supposed to die, but I am alive.' Hiroshima is now completely rebuilt but the victims' bones and blood still remain deep in the soil of the streets.

My belief that 'I was supposed to die' is gaining strength with every passing year. The reason is that on that day I was to go to the Shim hospital with my mother to hospitalize my elder brother. The epicentre was just 580 meters from the hospital. The ground temperature

at the time of the bomb blast reached 6000 degrees celsius. Because of the heat, the blast, and the radioactivity, a person vanished instantly, not leaving behind even a piece of bone. My elder brother who was standing at the verandah of our house located 1200 metre away from the epicentre died as a result of the heat. His face and neck turned black like lava from a volcano.

Another tragedy of the nuclear bomb was caused by the remaining radioactivity. It severely damaged the internal organs, blood and bones and killed tens of thousands. Even today, a number of people including some in the second generation are still suffering. The existence of chemical weapons, the effects of various chemicals, and the destruction of the environment are similarly dangerous for human minds and bodies.

I came to know a shocking fact from a newspaper on 29 June that after the nuclear tests by India and Pakistan, the focus would now be on the 4th generation weapons; a H-bomb with a laser. This means that a country can possess a nuclear weapon without conducting a nuclear test. What a dreadful situation!

Scientists are largely responsible for this situation which endangers all human beings. We should not be mere robots who work for the sake of our own country, but a human who is proud to serve for the benefit of all human beings on the planet. Politicians and military leaders have an important obligation to know what exactly happened in Hiroshima, not from the 30,000 feet height from where the A-bomb was dropped, but on the ground where 200,000 people died, and convey the reality to their people.

I sincerely hope children of the 21st century will grow up in a world without nuclear weapons, war and fear of starvation. Let us join together to realize this. Let the children, like me from Hiroshima and Nagasaki, be the last ones who experienced an A-bomb.

# Communication

WE would like to respond to the review of our book, *Towards a Non-Brahmin Millennium: from Iyothoe Thass to Periyar*, which appeared in *Seminar* 471, November 1998.

1) We have written a 556 page book. Its contents narrate a little-known history of modern Tamil society. Here are essays on brahmin subjectivity, the advent and decline of a certain sort of political non-brahminism, the assertion of dalit history and identity, the coming of the radical self-respect movement and the evolution of a distinctive Dravidian, non-caste political constituency. But Shastri Ramachandaran's review of our book has nothing to say about any of these themes. The reviewer appears disinterested in what we are actually saying in the book, as well as determined to impose his own largely distorted reading on the evidence we present. In this sense, the review reflects the reviewer's own prejudices than anything else.

We would have welcomed a robust, imaginative and critical review of our book which, unlike this one, is able to distinguish the passion we have for our subject from routine prejudice, and which is able to locate and suggest ways and means of overcoming the limits to our argument. But a review such as this, which ignores the book's contents and mulls over its own pet paranoias, does not serve its purpose or ours.

2) The book presents to the non-Tamil reader two great and unusual men and thinkers, Iyothoe Thass and Periyar. Both men were critical of brahmins and brahminism, but even more so of the varnashrama dharmic social order that systematically disvalues manual labour and labourers on one hand, and reifies the power of an intellect separated from life, work and lived social relationships, on the other. Nowhere in this review do we get a glimpse of the intricacy of argument and the passionate logic with which both men expounded their ideas. Instead we have a routine invocation of the most banal sorts of

objections to non-brahminism: that it was pitted against a mere 3% of the population; that its agents were facile in their historical reasoning; that, in fact the entire business of Aryan and Dravidian, and invaders and indigenes is a foolish bit of polemic; that non-brahmin leaders and ideologues worked overtime to perpetuate colonial rule; and that Periyar was a crude brahmin hater who hastened his followers to prefer snakes to brahmins.

None of these objections have any basis in fact, logic or sound argument. Brahmins may be a minority in Tamil country, but hegemony works everywhere through the power of expressive and highly persuasive ideologies and not through the power of numbers. In our very first chapter we have attempted to explain how this happened in Madras at the beginning of our century. Why has not Ramachandaran made a single reference to our complex description of brahmin subjectivity? Or to the fact that we have made brahmins speak in their own voice and allowed the reader to judge the limits to their avowed liberalism?

As for faulty historical logic, the references in our book to 'Aryan invaders' and 'foreign interlopers', as well as to the purported egalitarianism of old Tamil society – these have been duly historicised and contextualised. We have demonstrated how history was actually a favourite discursive game with intellectuals at the beginning of our century and that non-brahmins responded in a distinctive fashion to the challenges posed by colonial knowledge systems such as numismatics, philology and ethnology. The reviewer has made it seem as if the Aryan-Dravidian controversy was a foolish one and that those who indulged in it were misguided antiquarians who merely wanted to fault the Tamil brahmin.

Worse, he has conflated particular opinions, as expressed by particular actors and agents at a given

conjuncture, with what he assumes to be our views. This is truly mischievous, since it completely misrepresents our authorial reticence and makes us seem partisan. We have, as we note in our introduction, returned to non-brahmins and dalits a history that historians have denied them and returned to that history voices which have so far been unrecorded. We have not trespassed the limits of our enquiry, and have merely lived up to the passion which sent us on this historical quest in the first place.

The non-brahmin support for British rule is also wilfully misinterpreted. A careful reader of the text, especially of chapters 2-6, will note that non-brahmins preferred British rule to brahmin rule chiefly because they were unwilling to accept that Indian nationalism was truly consensual and were quite convinced that it was a fiction which served the interests of the Indian upper castes. The reviewer does not care to trace in all its complexity, the non-brahmin-British relationship as we have outlined it, and is instead content to fall back on unexamined assumptions that tautologically assert their truth value. As for Periyar, since this is one thinker who has proved notoriously difficult to domesticate, those who find his ideas bothersome, threatening and challenging attempt to get out of their unease by blaming him instead. Ramachandaran has resorted to this mode of criticism as well and rather than engage with a brilliant, fierce and prophetic mind has taken to ridiculing it.

Our book contains many instances of the great man's insights regarding the nature of power and the modes of its deployment in caste society and if these have not caught the reviewer's attention, one can only lament his loss.

Though one is loath to discuss authorial intent and motivation, Ramachandaran's self-righteous and cynical tone begs the question: why is it that whenever brahmin power and authority are criticised, those who feel such criticisms to be misplaced slide away from the terms of the argument and conveniently speak of the will to power of a generic and unspecified ruling class? Why this culture of silence, of non-accountability, this foreclosing of self-criticism?

Finally, it really bothers us that *Seminar*, in its issue on dalits, should carry such a review as this. Not only is it unfair to the book's subject but to the readers of the journal as well, for rarely does such an ill-informed and self-important article appear in it.

**V. Geetha and S.V. Rajadurai**

# Backpage

IT is often argued that election season is the best time to raise issues of general concern. After all, when else do ordinary citizens encounter the political class as captive audience, even more as supplicants. It is thus not surprising that so many of our activist groups rev up their special concerns hoping to inveigle them into the political agendas of contending parties. From onions to saraswati vandana – every conceivable issue is currently battling for political recognition.

In these hustings, where each contestant tirelessly proclaims his/her empathy for the poor, it is indeed intriguing that a recent cabinet decision to place the amended Land Acquisition Act (1894) in the winter session of Parliament has gone virtually unnoticed. No wonder the recent meeting of NGOs and action groups interrogating the draft legislation and proposing amendments never made it to our newspapers.

Rarely is it realized that barring Africa, India enjoys the dubious distinction of having generated the largest number of displaced people, a large majority in the name of development. The conservative estimate of the number of people displaced from 1950 to 1991 is about 2,13,00,000, if one restricts the causal factors to dams, mines, wildlife sanctuaries and industry. If one includes urban displacement due to various deliberate or planned activities, then the number would rise to 30-35 million. According to government records at least 75% of those displaced are still not cared for or rehabilitated.

Central to the process of displacement and (hopefully) rehabilitation is the Land Acquisition Act. This 1894 legislation laid down the purpose for, conditions under, and the procedure through which land could be notified for acquisition as also the compensation to be paid.

It is indeed instructive that, particularly after the shifts in economic policy favouring private enterprise, efforts are underway to modify the LAA with the intention to facilitate and speed-up the acquisition process. The current draft is a step in that direction. This when, despite nearly two decades of organising, networking and lobbying by concerned activist groups, the government has turned a deaf ear to pleas about a national rehabilitation policy.

The aforementioned NGO meeting points out that the evolution of the meaning of public purpose gives the state extremely broad powers of acquisition since it continues to be premised on the doctrine of eminent

domain. Simply stated, land which is not privately owned (all common property resources – forests, pastures, wasteland) is seen as vested in the state. Consequently, there is no legal recognition of the poor whose very livelihood depends on accessing these resources.

The proposed new definition of public interest not only goes beyond judicial scrutiny, but may be altered after acquisition and can only be determined by the state. Further, the thrust towards making the process swifter and less cumbersome has resulted in a drastic shortening of the legal notice period, as also the period in which objections can be filed. Finally, the district collector is sought to be installed as the final authority in the matter. Appeals, if any, can only be entertained by the High Court.

Notwithstanding the passage of the 73rd and 74th amendments to the Constitution relating to panchayats and municipalities, the proposed act is marked by its non-recognition of the locus-standi of even these statutory bodies, what to mention other collectivities and public interest groups. No right to information here! Similarly, when discussing compensation, the proposed act does not talk about replacement of livelihood lost or ensuring that life after resettlement is at the minimum equivalent to the state at the time of acquisition. Further, if our power minister is to be taken seriously, activists who delay acquisition proceedings should be jailed as anti-national for hampering our efforts to facilitate the inflow of private investment in infrastructure projects.

It should thus cause little surprise that affected groups and communities are dismayed with what they see as 'pro-industry' amendments. Unlike earlier when the state machinery was somewhat more pluralised and there was the possibility of relying on the state as a bulwark, the congruence of interest between the state and private industry is far more marked today.

If politics does serve a public-purpose then one has a right to assume that some of these concerns should be refracted through the political process. Or is it that those displaced or facing displacement, since they come from the bottom layers of society, often not even registered as voters, are in actual fact not citizens? As a nation prone to flaunt its status as the world's largest democracy, this is a question worth pondering over.
